MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 1956.—VOLUME LXXVI. Number 1. SAN FRANCISCO, SATURDAY, JANUARY 1, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

California's Golden Jubilee.

The California Golden Jubilee is being arranged with due regard to all requisite details. The general spirit and purpose of the occasion is shown in the address issued by the committee, signed by the presidents of the various organizations. It well says: "The event to be commemorated is one of wide-reaching importance and of long-enduring interest. It made a vast industrial revolution and aroused the human mind to higher activity.

"Fifty years ago the Pacific half of the earth, the vast region that sends its waters from the slopes of four continents to the greatest of oceans, was bound in the bonds of savagery or torpidity. Its quiet was not disturbed by the whistle of the railway or the cry of the newsboy—two of the characteristic symbols of civilization. Australia was a prison pen; Japan a recluse; the only ships that visited California or the coast to the northward came for hides, whales or furs, and the other shores of our ocean were nearly as dull.

"Marshall's shout that he had found gold echoed and re-echoed so loudly through all civilized countries that they were aroused to an activity previously unknown. California sprang at once into a high state of enlightenment. She not only developed her own mineral wealth with magical speed, but by her missionaries of the pick and pan she opened the mines of our coast from Arizona to Alaska, and even those of Australia. She poured out more than $1,500,000,000 of her own gold into the channels of trade and stimulated the neighboring States and Territories to add $500,000,000 more

FIG. 2.—ORE CHAMBER, 30 FEET WIDE AND 175 FEET FROM THE MOUTH OF THE HARD CASH SHAFT.

to that vast sum. By her indirect influence she pushed Japan and China into the current of general commerce, brought them within reach of telegraphs and ocean steamers and thus enlarged the world which she enriched.

"When our Union was in imminent danger, when vast armies occupying an area large enough for a great nation were arrayed against the Stars and Stripes, when the welfare of America was so greatly imperiled that many brave and wise men feared and even believed that disunion was inevitable—in that awful crisis the gold of California came to the rescue and helped greatly to save our country from the fearful evils that would have inevitably accompanied final disruption.

"Besides widening the area and increasing the spread of culture, California has made many valuable contributions to original thought. She has made her territory one of the pleasure grounds of the world. She has done much to give character to the wonderful age in which we live.

"These glorious achievements, these great contributions to culture, these remarkable events which our city has witnessed, to which she owes her birth and in many of which she played a large part—these results of Marshall's gold discovery deserve to be commemorated in a magnificent festival at the completion of the first half century, the only opportunity of the kind for this generation; and therefore we invite you to aid us in a worthy celebration of the Golden Jubilee of California on January 24, 1898.

"Nor should we close our eyes to the material advantages that must accrue to our citizens from the presence of large numbers of people who will not only expend considerable money in our midst, but who will thus be afforded an opportunity to learn of the advantages of San Francisco as a trading and outfitting point. These benefits are by no means small, and their value will be largely increased by the success of our jubilee celebration, which, in turn, must depend for its success upon the liberality and public spirit of our citizens."

FIG. 1.—EXTERIOR VIEW OF THE HARD CASH MINE.

A Kern Co., Cal., Mine.

In '97 the southern part of this State assumed increased mining prominence. For some years the largest number of stamps under one roof in the State have been operating in San Diego Co.; in San Bernardino Co. the dullness in silver production is being gradually overcome by increased activity in gold production, and in Kern Co. the comparatively new Randsburg district is attracting deserved attention. Three miles southwest of Randsburg is the Hard Cash mine, an exterior view of which is given in Fig. 1. Considerable work has developed a large quantity of free milling $12 ore. Fig. 2 shows an ore chamber 30 feet wide 175 feet from the mouth of the shaft. At present the milling is done at Garlock, Kane Springs, Cuddeback Lake and Johannesburg. It costs $10 per ton to mill and cyanide the ore. The company naturally proposes to build a mill of its own. Fig. 3 gives a view of the double compartment shaft.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.

Telephone Number, Clay 204.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00
All Other Countries in the Postal Union..... 4 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

San Francisco, January 1, 1898.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Exterior View of the Hard Cash Mine; Ore Chamber, 30 Feet Wide and 175 Feet from the Mouth of the Hard Cash Shaft; View of the Double Compartment Shaft of the Hard Cash, 1. After Ninety-three Days Hard Usage, 5. Englewood and Chicago Electric Storage Battery Road—Battery Charging Room, Showing Trays, Transfer Carriage with Battery Tray; Rolling Battery Tray on Transfer Carriage Raising Battery Tray Under Car; Elevation of Engine and Dynamo Plant, 6. Engine Room from Visitors' Gallery; Switchboard; Engine and Generators; Method of Mounting and Connecting Engines, 7. A Boiler Setting, 8.

EDITORIAL.—California's Golden Jubilee; A Kern Co., Cal., Mine, 1. Should Not Pass; Justly Censured, 2. American Dynamite in South Africa; Applications for Patents; To Prevent Mine Accidents, 3. Miscellaneous, 2-3.

ELECTRICAL PROGRESS.—Electric Storage Battery Road, 6-7. Distinction Between Energy and Power, 8.

SCIENTIFIC PROGRESS.—Determining the Points of the Compass; Franklin's Classic Kite Experiments; A Rubber Tube as a Core; A Gliding Boat, 8.

MECHANICAL PROGRESS.—A Boiler Setting; The Automatic Clerk; From Tree to Type, 8

MINING SUMMARY.—From the Various Counties, of California Nevada and Other Pacific Coast States and Territories, 10-11-12.

THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 26.

MISCELLANEOUS.—Notes on Western Australia Mines; Contract for the Erection of an Iron Bridge; The Displacement of a Ship, 4. Hydraulic Mining; Forged Steel Shoes and Dies; Notes on Present Western Practice of Metallurgy Economically Considered; A Fine Map; Speed of Locomotive Steam Engines, 5. Coast Industrial Notes; Personal; Answers to Correspondents; Obituary, 9. Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 12.

THE Golden Jubilee edition of the MINING AND SCIENTIFIC PRESS will be issued January 29th, the date of the opening of the Golden Jubilee Mining Fair in San Francisco. An unusual number of copies will be printed. Matter intended for appearance therein should be in this office by the 15th inst.

BEGINNING to-day, the Western Union quotation on the price of lead in New York City will be withdrawn, and hereafter "the Gold and Stock Telegraph Co." of that city will furnish daily current quotations for $20 per month to those who do not care to wait for the same thing in the Associated Press report for the following day. So far as the system itself is concerned, there seems little if any difference from former methods.

"A COMPLETE CATALOGUE of papers published in the United States printing over a thousand copies" December, '97, is received from the leading advertising authority in the country. It is of some interest to note that the MINING AND SCIENTIFIC PRESS and three others are the only four mining papers mentioned therein, though there may be others who deserve to so appear. Of the three others one is published in Pennsylvania, one in New York and one in Colorado.

REGARDING the Government relief expedition to the Klondike, Explorer Nansen agrees with the views hitherto expressed herein, that it is useless for the Government to buy 500 or any other number of reindeer in Norway for transportation purposes, by reason of the absence in the Yukon region of the kind of food upon which they alone can live. Explorer Nansen agrees with everybody else who has had any practical experience on the subject in condemning such means of securing transportation. The hardy horse of the North Pacific region is best adapted for the purpose intended.

REPORTS most encouraging to the stockholders come from the Merced Gold Mining Company's property at Coulterville, Mariposa county, Cal. This week it is reported that the average from the amalgam was between $8.50 and $9 per ounce Troy, which, at even the smaller figure, would have made their clean-up for the past month approximate $71,000 from forty stamps. As their payroll did not quite reach $10,000, if the reports are correct, they must have had net earnings of something like $55,000. If this can be kept up it would indicate little need of borrowing $60,000, as reported from Boston, or, indeed, any other sum, so that it would seem that there is very little likelihood of any actual need of assessments or other manner of securing money outside of the mine's yield.

Should Not Pass.

Congressman Ferguson of New Mexico has introduced a bill which is now before Congress for consideration, and which, while ostensibly of benefit to the miner, would, it is believed, be prejudicial to the best interests of the Territories of New Mexico and Arizona, which region it most seriously affects. The first section of the bill provides:

"That hereafter all mines or deposits of gold, silver, quicksilver or minerals of the same, copper, lead, tin, antimony, zinc, bismuth and other valuable mineral deposits, situated within the boundaries of any land the title to which is derived from the Government of Spain or of Mexico, by grant thereof made prior to the conclusion of the treaties between the United States and the Republic of Mexico, on February 2, 1848, and December 30, 1853, respectively, and now embraced within the Territories of New Mexico or Arizona, or within the States of Utah, Nevada, Colorado or Wyoming, are hereby declared to be free and open to exploration and purchase, and the lands on which they are found to occupation and purchase, by citizens of the United States and those who have declared their intention to become such under the mining laws of the United States and the provisions of this act."

No reservations are made regarding land grants previously confirmed by act of Congress, there being over fifty in New Mexico held under United States patent. The confiscation of private interests, the unsettling of titles and the general local disorder that would ensue were such a bill as the above passed are manifest. The bill authorizes any one to go upon any of the lands specified, and explore thereon for gold, silver, copper, lead and other mineral deposits; and the only redress any one holding possession of such land under United States patent would have would be in civil action for damage done.

The bill further provides in Section 3 that the explorer or prospector, after selecting his claim on such land, shall merely post notice of location and proffer $2.50 an acre to the owner of the land, and, if declined, the "explorer" may go on and condemn the land as though it were for railroad purposes and take possession. This is even better than the United States statute, which provides that, before application for patent can be granted, it must be shown that $500 worth of work has been done on the property; then the fees in such cases usually amount to $200 or more, and $5 an acre must be paid for the claim. Under Mr. Ferguson's proposed legislation, $50 would be all the money required to consummate what usually costs twenty times that amount.

The bill is a good or bad example of hasty and incomplete legislation; and while the spirit and purport of the bill are worthy of endorsement, its provisions as at present before Congress would work direct injury and wrong in the region affected.

THE world's production of gold in 1896, according to advance sheets of the forthcoming report of the Director of the Mint, was 9,817,991 ounces fine, valued at $203,000,000, compared with 9,611,377 ounces fine, valued at $199,304,000 in 1895. This increase of the world's gold output in 1896 over that of 1895 is not as great as was that of 1895 over that of 1894, which amounted to $18,129,000; nor is it as great as the increase of any recent year over the preceding one. World's output of silver in 1896 was approximately 165,100,887 ounces of commercial value of $111,278,000, and coining value $213,463,700, a decrease as compared with 1895 of 2,187,842 ounces, commercial value $1,474,606, and coining value $2,828,725. The total world's production of gold from 1493 to 1871—that is, from the discovery of America to the year in which Germany took the first steps toward the demonetization of its silver—was 278,360,543 ounces fine, of the value of $5,754,-223,105.

MR. EDWARD ATKINSON, who can do what he likes with figures, sends us a third edition of a pamphlet in which he endeavors to prove that silver costs nothing to produce at the Anaconda, Montana, mines. This is even better than the chimerical claims of the gentlemen who can produce gold from iron filings, and silver from coal waste heaps. Such production costs at least something, but Mr. A. gravely announces that in the locality named "silver costs nothing." Probably had that distinguished statistician taken the trouble to get some reliable information on the subject before writing about it, he would have arrived at a very different conclusion.

Justly Censured.

A River Convention was held in Sacramento, Cal., last week, wherein the State Auditing Board was justly condemned for its continued action in ignorance or defiance of the act of the last Legislature appropriating $300,000 for the purchase of a dredger, which distinctly stated the purpose of the appropriation. It has been clearly pointed out in these columns before, that the State Auditing Board had no discretion in the matter, beyond carrying out the provisions of the law, and that it was presumptuous and impertinent for these servants of the State to set up their own judgment, assuming a better plan, and spending the money in accordance with their own private ideas.

The temper of the convention was excellent. It was plainly pointed out to the State Auditing Board that they were practically guilty of malfeasance of office, and that, without right or reason, they had presumed to put their personal opinions in the matter before the plain mandate of the State law. The author of the bill, W. M. Cutter of Yuba, recited the facts, which are patent to everyone, and very justly said: "The bill would not have passed had it not been for its exact wording relative to the building of the dredger; and the Auditing Board, created by the same bill, had no right to set up its own judgment in opposition to the express provisions of the law that created it." With unusual impudence the members of the Board saw fit to criticise the press for commenting on their unwarranted action. They at least had the courage of their convictions, and did not seek to throw the blame upon anybody else, shouldering the responsibility for evasion and avoidance. In response, W. T. Phipps, manager of the Anti-Debris Association, very justly said, "that their argument was like that of a farmer with a good farm who refused to buy a team of horses with which to work it, because he had not money enough to buy feed to feed them for fifty years while he was farming."

A vote of censure was, after some excuse and apology, referred to the Committee on Resolutions by a vote of 30 to 23, who, upon readjournment, substituted a mild reproof, stating that in the sense of the convention, it was the duty of the Auditing Board to comply with the law. This substitute was adopted by a vote of 21 to 20; so that, virtually, on two distinct votes, the Auditing Board and the State officers connected therewith, were justly and severely censured.

It is a matter of regret that in this important question, affecting State and national interests alike, recalcitrant officials can be found willing and apparently anxious to fritter away the appropriation made for a specific purpose, in the manner they are doing, without check.

"THE Great Northern Industrial Gold Co., Ltd.," is the latest mining proposition profferred British investors. The property is in Shasta County, Cal., and the scheme is advertised at considerable length in London mining journals. The concern is capitalized at $2,000,-000, shares are $5 each; 50,000 shares are held in reserve by the company. The prospectus is a very pleasant one. As to accessibility, "a stage road passed within ten miles of the property," and "labor of the best kind—good, strong, ready, mountain men—is cheap and abundant." Eminent London mining engineers see 10,000,000 tons of ore in sight, but a local mining engineer of Oroville calculates the "available supply of ore" to be 11,000,000 tons, and, in addition, he "feels perfectly assured there is more than twice that quantity." Another mining engineer considerately declines to make an estimate of the quantity of available ore "because the figures could be made so large that they could scarcely be conceived." In such cases a few million tons of ore one way or the other are of little consequence. This ore is of an average value of $8 per ton, and "$1.35 per ton will cover all expenses when in full operation." It is estimated that $350,000, cash, will be "required

to put the property in full operation," there being sufficient water "power to operate 250 stamps day and night." At the end of fifty or one hundred years, (according to the prospectus) "the question of sinking or following the ore down into the earth, as in ordinary mining, may be considered." One gentleman has succeeded in getting the local owners together and spent "a large amount of time and money," for which he is to be paid "through the vendor." The same gentleman also kindly agrees, as per prospectus, "to go out again and overlook the work on the spot until the mines are in full operation." Certainly nothing could be fairer than that. The London papers give editorial information gleaned from the prospectus, but, of course, wholly uninfluenced thereby. "The precise situation of the property is in Sierra Nevada mountains," is among the exact data thus editorially vouchsafed. The whole thing is interesting, taken in connection with the series of articles and communications on this subject of British investment in California mines which has recently appeared in these columns.

Applications for Patents.

Some recent amendments of the United States patent laws which go into effect to-day attract deserved attention. Hitherto there has been but one barrier to the issue of a patent by our Government to a man who had proved that he was the original inventor. If the article in question had been in public use, or on sale for two years or more before the man sent his application to the Patent Office, he could not receive a patent. The public use and sale would naturally be considered as evidence of his having abandoned all claim to exclusive rights. The natural interpretation of the facts would be that the man did not consider himself the rightful owner, or else was willing to give the public the benefit of his ideas without charge.

The new law provides that if a notice of an invention appears in print, and specifies who is the author of it, the application for a patent must be made inside of two years; otherwise it is assumed that he abandons all claims. This appears just. It sometimes happens that several simultaneously invent the same thing. If the first man who thinks of it does not push the matter, either for lack of money or because he lacks the necessary spirit of enterprise, some of the other men should have a chance to go aheadand take out a patent. The wording of the revised statute is as follows:

"Any person who has invented or discovered any new and useful article, machine, manufacture, or composition of matter, or new and useful improvement thereof, not known or used by others in this country before his invention or discovery thereof, and not patented or described in any printed publication in this or any foreign country for more than two years prior to his application, and not in public use or on sale in this country for more than two years prior to his application, may, upon the payment of the fees required by law, and other due proceeding had, obtain a patent therefor."

THE horizon of the Mining Fair to be held in this city, beginning January 29th and closing March 6th, constantly enlarges in scope. Several California counties, realizing the value of the advertisement, have made suitable arrangements to be appropriately represented thereat, and it is not yet too late for any mining county in this State to secure space and appropriately use it. The MINING AND SCIENTIFIC PRESS has so frequently pointed out the manifest advantages to be gained from such an exposition, that no urging need be necessary in this regard. The committees in charge of the Golden Jubilee celebration and of the Mining Exposition are doing considerable preparatory work and success is assured. It has been determined by the Mining Bureau of this State to make appropriate exhibition. The exhibit which Nevada sent to the World's Columbian Exposition will also be displayed intact. The entire exhibit of the State Board of Trade will be likewise transferred to the Pavilion. Considerable interest also attaches to the parade and general celebration in San Francisco of the Jubilee week, beginning the 24th inst. Governor Budd will declare the 24th a legal holiday. Members of different organizations will unite in making the parade a notable one. Miners will be interested in knowing that what is probably the most extensive and elaborate scenic effects of practical mining operations ever seen in an exposition of this kind will be at the Mining Fair, and that the latest, up-to-date processes and machinery for gold mining will be in practical operation.

American Dynamite in South Africa.

From Cape Town, South Africa, Consul Roberts writes: "Such an important position does the dynamite trade occupy to-day in that part of Africa south of the Zambesi that peace in the Transvaal, it might be said, depends much on its regulation. The first suggestion mentioned by the mining commission, appointed by the Transvaal Government some time after the Jameson raid to investigate the alleged grievances of the Johannesburg Uitlanders, was to lower the tariff on dynamite. This, the commission believed, would go far to conciliate the influential element on the Rand, mine owners, shareholders and mining engineers. It was the almost prohibitive duty on dynamite that incited many of the better class of Americans, who form a vast majority of the mine managers, engineers and experts at Johannesburg, to take part in the Jameson fiasco. It was due to these men also that American dynamite was introduced into South Africa, until now the United States furnishes more than any other country to this portion of the world. It is satisfactory to note, however, that this steady growth may be ascribed to the superior quality of the American goods, which is attested to by nearly all mining men on the Rand, irrespective of nationality. This is shown from the fact that dynamite can be delivered in the Transvaal from Hamburg, including cost of importation and duty, at 37s 7d ($9.39) per case, and from Dr. Nahnsen's factory for 46s 1d ($10.87), while the rate from America is 47s 7d ($11.22), but the latter country, nevertheless, has the call on the trade. The cost from Cornwall is 52s 1d ($12.33) per case. The quantity of dynamite and other nitroglycerine compounds landed at Cape Town from abroad in the year ended December 31, 1896, was 55,000 pounds, valued at £791, or $3,955. Dynamite and blasting compound powder (practically all the former) was imported into the colony during the same period to the amount of 12,327,540 pounds, valued at £538,245 ($2,619,225). Of this amount 1,301,210 pounds were entered for consumption under the union customs act prevailing in Cape Colony, Orange Free State, Basutoland and the Bechuanaland protectorate, while 10,940,013 pounds were for transportation to the South African Republic and Rhodesia, an insignificant portion being shipped to the latter province.

"The duty on blasting compounds for consumption in the countries included in the customs union is 3d (6 cents) per pound. On that entered for transportation to non-union countries a transit duty of one-half of 1d (1 cent) per pound is levied.

"Immediately on the discovery of gold in the Transvaal, dynamite came into great demand, and a syndicate, seeing the opportunity for immense profits, obtained a concession from the Government to manufacture the explosive. This developed later on into a monopoly, for, when the mine managers objected to the Transvaal article, which was manufactured from ingredients procured in Germany, the duty on the imported article was raised to what was expected would prove a prohibitive rate. The top rate reached was 9d (18 cents) per pound. Figuring on the rate per pound as 1s 9d (42 cents), and including the transit duty and other details of shipment not counted in the computed total, the cost of the article delivered at Johannesburg is just double the wholesale cost at Cape Town.

"Many mines preferred to pay the exorbitant rate and get the American article, but there was enough demand for that manufactured in the Transvaal to cause a great rush, and when the syndicate found they could not put the imported ingredients together fast enough the manufactured article was imported straight from Germany and entered, of course, free of duty."

THE December drouth and continued frost has seriously interfered with mining progress throughout California. The water courses are running very light, and, so far, the usual supply of snow and rain is entirely wanting.

To Prevent Mine Accidents.

Mine Inspector Byrne of Montana makes report in which he says: "Unlike most other callings, the security of the miner is largely dependent upon the care and prudence of his fellows, but so wide is the character and disposition of men that in order to obtain unity of action from large numbers, the necessity of subordinating individual plans and methods to a well organized general system must be evident. The duty of the superintendent does not cease when he furnishes means of safety and issues instructions. He should see that the one is properly used and the other implicitly obeyed, and in no instance should he allow the subordinate officials to jeopardize the safety of those in his charge.

"Opposition has been manifested to the law requiring the enclosure of safety cages in vertical shafts. The purpose of the law is to protect the miner against the various dangers encountered while being lowered in or hoisted out of the mine. The necessity of it is shown by the number of lives sacrificed while riding in open cages in the past. With a few exceptions, the law had been complied with. Conditions existed in those exceptions which made it nearly impossible to comply with it within the time specified. A degree of indulgence has been exercised in this matter in the hope of removing certain prejudices existing among a considerable number of employes as well as a few mine owners; also to allow time in which to complete improvements and changes planned previous to the enactment of the law. I am convinced that reasonable leniency is the better policy as against arbitrary enforcement. Sufficient time has now intervened to demonstrate the feasibility and advantage of the measure by pointing to its successful application elsewhere. Now that these conditions which formerly operated against the immediate enforcement of the law have practically disappeared, proper steps have been taken to secure its rigid observance in the near future."

APART from the shrinkage in speculative values of South African mining enterprises, a review of the dividend record of South African corporations for the past two years shows considerable justification for that region being a favorite one for British investment. The possibility of a reform in the Boer government of the South African Republic, which will remove some of the present excessive taxation from the miners, also renders probable a decreased cost of gold production in '98. For the bluffing tactics that culminated in the Jameson raid has been substituted on the part of the Uitlanders persistent showing how mutual interests could best be served by relief from the present untoward system of monopolies. The earning power of the South African mines is noticeable. Good authority is given for the statement that the dividend-paying mines of the Rand district yielded their shareholders $12,250,000 in dividends in 1897. When it is remembered that in 1895, the year of the biggest "boom," the mines of that district paid in dividends a little over $10,000,000 it will be seen that the gold-producing properties keep up very well. The diamond mine companies of the Transvaal, which in 1896 paid dividends aggregating $9,500,000, in 1897 yielded a total of dividends amounting to nearly $9,000,000; and in the same time copper mining companies of that region paid dividends aggregating nearly $1,000,000. These figures go far to justify the financial interest evinced by British investors in South Africa.

A BILL has been introduced in Congress to appropriate funds for investigations and tests of American timber. The bill starts out with the following preamble: "Whereas, an enormous waste of forest products and incalculable loss of life and property occurs from ignorance of the true value and strength of American timber; and whereas a thorough examination and elaborate tests of our timber have been introduced in the forestry division of the Department of Agriculture, but have proceeded very slowly, and have now been entirely discontinued on account of deficient appropriations, therefore be it enacted, etc., that the sum of $100,000 be hereby appropriated" for the purpose. It is provided in the bill that not less than 30 per cent of the amount appropriated be devoted to the testing of timbers of the Pacific coast.

Notes on Western Australia Mines.

Written by JOS. GRUSS, M. E.

Having returned on the Mariposa on the 18th ult. from Western Australia, it might interest tne readers of the MINING AND SCIENTIFIC PRESS to know something definite about that far-off and interesting mining country. After going from here by way of the Suez canal I landed in Albany, one of the principal ports of the colony. From there to Perth, the capital of the colony, the distance is 275 miles. The latter town is situated on the Swan river, the only flowing stream in the colony, and has a population of about 40,000. It is eleven miles from Freemantle, on the Indian ocean, which is the most important seaport in the colony, and is 2500 miles west of Sydney, New South Wales. Perth is a rather pretty place, quite hot, and has some very fine buildings. The town is built on a white sand, which is the general nature of the country for miles around. It is sadly in need of a good sewerage system, as there are many bad odors prevalent owing to lack of same. It is also the cause of considerable typhoid fever, etc. The flies are also very troublesome in the summer season, which corresponds to our winter.

After leaving Perth the first mining town I struck was Yalgoo, in the Murchison gold fields, about 350 miles southeast of the former place; population, about 150. The country traversed is a perfect plain, with only such a slight rise toward the interior that it is imperceptible. At this place there are quite a number of mining leases (or locations), but the most important ones are the Emerald and Gem. One has a 10 and the other a 5-stamp mill. These mines were very rich from the surface down to a depth of about 45 feet, the rock milling from two to seven ounces per ton, besides what was lost or run off in the tailings. But they did not go down, apparently, as they were looking for the "reef" or vein on the 80 and 100-foot levels, without any indication of finding the same. The vein gave out, as they are only "top mines." The system of mining and milling here was very crude. The stoping was mostly done from the top downward, in place of upward, and the plates used were as hard and dry as a bone.

The next place was Mount Magnet, some sixty miles distant by rail, which is quite a mining camp of the usual West Australian type—corrugated tin houses, tents and Hessians (which latter are burlap houses, and to protect them from the heat of the sun they are covered with bough sheds). Mount Magnet derives its name from a small hill near by, which rises some 100 feet higher than the general average of the country. There are quite a number of mines and some mills here, and also a great many "shows," which is the Australian name for prospect. The well-known Welcome mine is located at this point, the rock of which was of fabulous richness. Over 6000 ounces have been pounded out by hand mortar in a few months. The deepest shaft in West Australia is located here, its depth being 500 feet; but there is nothing in the bottom. Mount Magnet is also quite an important point, from whence depart a great many camel trains for the East Murchison gold fields, over 200 miles distant. The population is about 750.

The next place we visited was Lake Austin, or Austin Island, about thirty miles to the east. It is a dry lake, like all West Australian lakes, but contains water after a series of heavy rains (which are not frequent in this section), when it soon turns into brine or salt water. Here are two mills and quite a lot of mines and prospects, or "shows." Neither of the mills was running at the time for want of sufficient water, and also a scarcity of good ore, as the best was worked, it having been near the surface. But while it lasted it was exceedingly rich, going up to fourteen ounces per ton.

From here to the next mining camp, which is called Day Dawn, it is about twenty miles (to be made by stage), and in that space there are numerous mines and prospects, and several mills, which are, as a rule, short of water. The ore is irregular and patchy, but very rich. Like all mines seen so far, they do not go down very deep; from 60 to 100 feet is about the most auriferous zone. Most of the mills and hoisting works in this part are not housed in, everything being exposed to the sun. At Day Dawn there are several mines, but the most important one is the Big Day Dawn, which has forty stamps, and was not running at the time of my visit. It is one of the worst butchered up and most senseless mining and milling plants I ever saw. Everything is built wrong end first. It could have been remedied by the investment of a few hundred dollars in cement, to raise the mill and battery and make things work automatically or by gravitation. The quicksilver from the plates was running in great globules down the sluices, and the loss of amalgam and gold must have been great. The vein is a large one, some 18 feet wide, and the ore shoot is reported to be 300 feet long, but low grade—not over fourteen pennyweights to the ton. Mr. L. P. Goldstein, formerly a field deputy in the Mining Bureau in this city, has been appointed manager since I saw it. The heat in the summer time is very great at the above place.

Four miles east we come to Cue, one of the oldest and largest mining camps in the Murchison gold fields. It had a population of about 2000 at the time of my visit, but has grown considerably smaller since I left. It has four banks and four or five hotels, in each of which there are no less than two bar rooms presided over by the ever-present bar maid. The postoffice and the Murchison Club Hotel are the best buildings, being of stone and brick. The Government owns the water works, which consist of a well with a steam hoist. The price of water is reasonable, 12 cents per 100 gallons. The rate of wages for miners is about 12 shillings ($3) per day. Almost everything consumed in the shape of eatables is canned. No attention is paid to the table of the hotel, but the bar is the point of attraction. Drinking is excessive here, and the flies are a great torment. Within a radius of five miles of the place are a great many mines and "shows" and some twelve mills, which were mostly idle, either for want of sufficient water or lack of pay rock, as the reefs here do not go down deep, either. The deepest shaft was 200 feet. A great deal of money has been squandered and wasted unnecessarily, three men being generally employed to do the work of one good man. An immense amount of dry blowing has been done in and about this place. Hundreds of acres have been turned over three or four times, with very good results for the first time or two, but there was only small wages in it while I was there. Eight hours constitute a day's work, and Saturdays four hours.

Some seventy or eighty miles from here is the mining camp of Peak Hill, whose ores are very rich indeed, going as high as twenty-four ounces per ton, and it has been and is yet a fine place to make money for prospectors by the hand mortar process, some of the small seams being worth at the rate of 100 ounces per ton. But they do not go down any great distance.

The next place is Lawlers, 210 miles east of here, in the East Murchison mining district, and is divided from the Murchison district by the Black range, being a small range of hills of ironstone and quartz. The intervening country is a perfect plain, mostly covered with the usual West Australian mulga, sandalwood and other small trees from 8 to 20 feet high and 3 to 8 inches in diameter. The road for the greater part is good, with some sandy spots here and there. This distance must be made either with horse teams or by camels. The Government has sunk wells every thirty or forty miles to facilitate travel, so you can stop at a well about every night. There are no habitations on the road to speak of. Lawlers contains a population of about 380, including a few families. At this place is located the property of the Great Eastern United, Limited, which has twenty stamps running. The ore, which is a pure quartz, has been averaging two ounces per ton. The depth from which the rock was hoisted is only 72 feet. The vein or reef runs from 2 to 20 feet wide and the ore shoot is 1200 feet long. On the 130-foot level, the deepest point, nothing has yet been struck of practical value. No dividends have yet been declared. The expense of extracting and reducing the ore is quite large, some 120 men being employed to keep the mill running, together with numerous officials and sinecures, who only render technical service. They have a sufficient amount of water for milling, which comes from the mine and is fresh. The process is the amalgamation in the battery, on plates and some blankets. No concentrators are used. Like all West Australian mines, there are too many men and superfluous officials. There are a great many mines and shows located in and about here, but none have any crushing plant except the Great Eastern United, Limited.

From here my route was to the north forty miles, where is located Mount Sir Samuel, where the Bellevue mine is found, which is the only good and great mine here so far found. Its depth is 80 feet, and the level from which the ore is taken is 52 feet. The vein will average 8 feet in width and the ore body is about 1600 feet in length, and should easily mill two and one-half ounces per ton without any trouble. The ore is somewhat copper stained and contains, also, much oxide of iron and the well-known ironstone of West Australia. The country rock is diorite in the bottom. They have a 20-stamp mill on this property, but up to the time of my departure it was not running, owing to insufficiency of water. On the foot wall side the water came in fresh, and on the hanging wall it was salt. Lake Corrigan is near by, but, like all West Australian lakes, is dry. The next mine to the north of the Bellevue is the Mertzy's Reward, of which Mr. H. Stansfield, a Tuolumne Co. man, is manager. It is a small concern, with rich rock, but not sufficient to justify the erection of a mill. The depth is 60 feet. The Venture Syndicate, a London corporation, worked a lot of leases here also, but gave them up, the ores being fairly good but limited in quantity.

Twelve miles north of Mount Sir Samuel is Mount Pascoe, where the Abbott lease is located, being the property prospected by the Great Fingall Reefs Co., Limited, of London, of which I was the manager. It is developed by four shafts. The vein stands almost vertical and is encased in the usual matter, called "mullock" in West Australia, which is something of the soft metamorphic schistose order, being the general formation in which veins are found in this part of the country. It extends down from 60 to 100 feet, where it usually encounters the hard, close-grained diorite, and the veins, as a rule, cut out or terminate on that formation. This reef was quite rich on and near the surface, being worth over two and one-half ounces per ton on the surface; but in a measure as it went down it became poorer and smaller, until it terminated on the hard diorite, where it gave out altogether. Therefore, it did not justify the erection of a mill, owing to the limited quantity of good ore in sight and the great expense to be incurred in erecting and running a mill and operating the mine. Labor is $3.33 per day and timber is quite high. Water was brought on camels twice a week. There are other shows or prospects in the vicinity, the most promising one being called the Nil Desperandum, which has about 3000 tons of ore in sight. It is claimed to be two-ounce rock, but the manager, for some reason, objected to my sampling it.

Lake Darlot and Lake Way are also in this neighborhood, and each one contains numerous shows or prospects of rich ore in moderate quantities, but have no crushing plants.

To an American mining man the country looks, as a rule, "butchered" by the impractical and expensive methods of so-called eminent mining engineers of English and other colleges and schools, who have a lot of initials after their names, which is their only stock in trade. And the result has been that millions of pounds sterling have been wasted and every ounce gotten out has cost John Bull six to get.

The English mining promoter, middleman and mining shark is not quite as scrupulous as his American cousin, so you can imagine the kind of a man he is.

It is quite unsatisfactory and disappointing to most Americans to manage shows or prospects, in so far that a report has always been made in advance by those so-called eminent engineers, who put up the grade of the ore to two ounces or over (generally two ounces), irrespective of its real milling value, and if it does not contain one-half of an ounce the American is expected to substantiate or affirm the amount it is "sladed at" by the "eminent fellow," and if he does not, the *entente cordiale* with the consulting engineers and promoters will be much disturbed, as they always retain the position of consulting engineer.

From a mining point of view West Australia is an interesting country, but it will never be a place of homes for miners or prospectors until the promoters step out and the prospectors rely on themselves to get the metal out of the ore, and not wait to sell out. As it is, the prospector or miner, if he has no chance to sell his show, folds up his tent and walks off with his house on his back to look for something elsewhere.

The Government is doing all it can to open up the country by railroads and sinking wells, to cheapen and facilitate travel. But most all prospecting camps are reached by camel trains. Feed is quite high for horses, whereas camels are par excellence the animal for level and dry plains. Where a horse will starve without being fed a camel will do well, as he can stand it without water for a number of days; and if he is forced to do so he will go twenty or twenty-four days without water, and his food is the small branches of the mulga and sandalwood and other trees which cover the country. A camel will carry 600 pounds and upwards thirty-five miles a day, and a good riding camel will go 80 to 110 miles per day.

In another letter I will give a description of the country between Lawlers, Coolgardie and Kalgoorlie, covering a space of 370 miles, traversed by me.

There are a few Californians down in that country, best known of whom is C. H. Kaufman, formerly a well-known surveyor here; also H. C. Callahan, H. Stansfield, W. A. Irwin and a young man by the name of Hoover, a miner from the Leland Stanford University. It is reported that Charley Kaufman is a millionaire now.

THE A. & P. ROBERTS COMPANY, which owns and operates the Pencoyd Iron Works of Philadelphia, has received a cablegram from Utrecht stating that the company's bid of $474,000 is the lowest in competition for the contract for the material and erection of an extensive iron bridge over the river Yssel, near Westervoort, Netherlands. The bridge is to be built for the government of Holland, and the Pencoyd Company had as competitors a number of the leading iron manufacturers and bridge builders of England and Belgium.

THE displacement of a ship is the volume of that portion of the hull which is immersed, or which has displaced an equal volume of water and now occupies its place. Displacement is properly expressed in cubic feet, giving the measure of the place or hole-in-the-water filled by the ship. As the weight of the vessel as she swims is exactly the weight of the water displaced, it is convenient to express the displacement as so many tons, meaning tons of water at 35 cubic feet to the ton.

Hydraulic Mining.*

NUMBER III.

Dams and Reservoirs.—For arresting and diverting the water of the supplying stream into the ditch, a dam of some kind will be required. As the mountain rivers and streams of California are torrential and subject to violent floods, these structures need to be solidly built. They are usually of two kinds, one being constructed of round or hewn logs so placed across each other as to form a series of cribs from 8 to 10 feet square, these logs being notched so as to lock into each other and fastened together with wooden pins, or, better, with iron bolts, the bottom timbers being bolted to the bedrock.

As the dam is built up these cribs are filled with rock. To render it tight the face of the dam is planked, the seams between the planks being battened or calked. A cheaper and more common style dam is made by felling large trees across the stream and then placing the butts of other and smaller trees on these with tops up stream. This done, another layer of trees is placed at right angles to the last, this process being continued until the structure is raised to the proper height. Each layer of trees as put down is covered with rock, gravel and brush, forming a mass not easily effected by the greatest floods.

Hardly ever are dams of masonry or framed timbers built for filling these ditches, as these other and cheaper structures generally answer every purpose. Sometimes nothing more than large bowlders are thrown into the stream, thus serving to divert enough water to fill the miner's ditch.

For regulating the admission of water into the ditch a gate must be placed at its head, the drop in the gate being raised and lowered by means of a lever or screw. Where practicable, it is well to have the upper part of the ditch, for a few yards at least, cut in solid rock, as affording greater security to the gate and the ditch itself against floods.

Owing to the recurrence of the long, dry summers in California, and the consequent low stage of water in the larger streams, some of which fail altogether, the storage of enough water to enable the hydraulic miner to continue or much prolong his operations during this, the most favorable season for the same, becomes to him a matter of paramount importance; hence the construction of the many large reservoirs found in the mountains of California, formerly drawn upon to supply the hydraulic ditches when the running streams failed.

Hardly anywhere else in the world can be found such costly and capacious reservoirs as these in the region above indicated, although similar structures, designed to fill the irrigating ditches, are now being built in other parts of the State, some of which, as regards cost and holding capacity, rival the great water repositories cradled in the basins high on the westerly slopes of the Sierra Nevadas.

These stupendous works were projected and built at a time when the hydraulic miners had reason to believe that they would be permitted to carry on their operations without interruption—at a time when the people and the public authorities of this State were applauding the enterprise of the builders and encouraging them to make these heavy expenditures.

Bedrock Tunnels.—The bedrock tunnel, so called, is an adit driven to reach and open up the gold-bearing gravel deposit where this rests in a channel having rocky sides, the latter termed often the "rim-rock," it consisting of the same formation as the bedrock—the floor of the channel. Not in all hydraulic deposits, nor perhaps in a majority of them the world over, does the bedrock tunnel become a necessity. In California these adits are not much needed except along the central portions of the main gold belts, the sites of the dead rivers or ancient pliocene channels. Elsewhere in the State these deposits occupy, for the most part, the channels of more recent streams, being the former beds of the present rivers, which, on becoming filled up, were deflected from their course. Owing to the frequent shiftings, or other causes, nowhere have these streams eroded the deep, rocky troughs characteristic of the dead rivers. The extreme richness of the latter, many portions of which contain enough gold to warrant their being exploited by the drift method, more than compensates for the additional cost necessitated by the driving of these tunnels.

Where a tunnel of this kind requires to be run, a shaft should first be put down to bedrock in order to determine the level on which it is to be carried in, otherwise there is danger of its being too high, thereby defeating the end it is designed to subserve. If the tunnel on reaching its objective point is found to be too low, a shaft must be raised connecting its inner extremity with the washing pit. Through this shaft the water and gravel are dropped into the tunnel, and by it transmitted to the sluice set below its mouth, the tunnel itself usually being paved throughout its entire length with cobbles or wooden blocks. Their character as regards size, grade, etc., will naturally suggest itself to the builders, the rule being to adapt the size of the tunnel to the work to be done, and give it all the grade there is to spare. Frequently it happens, even in these pliocene formations, that large bodies of gravel stand above the rim-rock. Where such is the case, washing may be commenced and carried on for a long period, the construction of the bedrock tunnel being meantime delayed.

Forged Steel Shoes and Dies.

Herewith is shown a representation of forged steel shoes and dies after having been in use for ninety-three days at the Berners Bay Mining and Milling Company of Alaska on extremely hard rock.

AFTER NINETY-THREE DAYS' HARD USAGE.

It is thought that in some localities these shoes and dies would have lasted thirty days longer. They were furnished by the Union Iron Works of San Francisco. These shoes and dies are forged from tool steel and have given general satisfaction. Exact data is not at hand regarding the service, but it is believed that the shoes and dies as shown crushed at least three hundred tons of unusually hard rock.

Notes on Present Western Practice of Metallurgy Economically Considered.

NUMBER III.

By W. B. DEVEREUX.*

With coppery ores I have used a forehearth to collect both the matte, slag and lead, and found it to work satisfactorily, except for the disadvantages of cooling too rapidly, to which I have called your attention, and even then it worked more satisfactorily than the old method of separating the lead inside the furnaces. If lead furnaces could be constructed to run satisfactorily with a capacity of 200 tons a day, I have no doubt that the forehearth could make a very complete separation of clean matte and clean slags, and, at the same time, make more campaigns. I have recently seen in a lead furnace a forehearth after the Orford plan, being used, which, as you know, is a rectangular box divided by a brick partition, with an opening between the two compartments at the bottom of the partition. The matte and slag flow into one compartment and separates by gravity, and the matte rises in the other compartment and overflows from a spout about 2 inches lower than the slag spout, the slag flowing out from the spout in the first compartment. This was, however, supplemented by the addition of another pot to catch any small grains of matte carried over in the current of flowing. The best method of disposing of slag is by granulation in a current of water, which carries off the slag and deposits it at some point below the smelter. Where water is available, this is very much the best method in use, and brings about a great saving in labor and cost. The slag is simply allowed to overflow from the forehearth into a trough with a rapid flowing stream of water, and is immediately granulated and carried away to any convenient point. Where water is not available, the present practice in large works is to use the Nesmith slag trucks. As you know, they consist of two large pots on a truck, so arranged that they can be swung out to the side and dumped on the outside of the track. The track for this is placed along the edge of the slag dump, and is moved out as the dump extends. In some works the slag is tapped or poured from the pan pots into these slag trucks. In others it is poured into very large pots, from which the slag is tapped from the side, and the matte tapped subsequently from the bottom. In others, the slag empties directly from the forehearth into the bowl of the truck. The ideal method for separation would be to have the slag flow from the forehearth into the water, or directly into large trucks, the matte being either tapped from the forehearth or allowed to overflow. In Rhodes' method the slag and matte from several furnaces are poured into a reverberatory furnace, which is in effect a heated furnace.

It is found that, even with the syphon tap for lead, a certain amount of lead often finds its way out from the slag tap into the forehearth, and this is obtained either with the matte or by tapping the forehearth at its lowest point. Of course, the most valuable product of the furnace is the bullion, so called, consisting of lead, varying amounts of silver, gold, and some copper, if copper is present in the ore. It is obtained by means of the well known syphon tap, generally by dipping from the bowl, but in some works by means of a trough which swings over molds arranged on the circumference of a circle of which the trough is the radius. With this arrangement a number of molds can be filled at a time. Copper in lead ores in any considerable quantity often causes a great deal of trouble with the lead in the crucible, as it has a tendency to separate out in the form of a copper-lead alloy, which gradually cools and fills up the crucible, making it necessary to blow out the furnace and chisel out the crucible. As this alloy is very tough, it makes the process very expensive. For this reason smelters do not like to have their lead mattes run over 10 per cent copper.

The principal part of the copper should go into the matte, which is a mixture chiefly of sulphides of lead, copper and iron. If this carries little copper, it is simply crushed, roasted and put back into the furnace, furnishing iron for flux, giving up its valuable metals to the bullion.

In lead bullion carrying copper the copper is only paid for at the price of lead, and, as it is worth three or four times as much, it is desirable to save it by itself. The present practice is to save the lead-copper mattes until a sufficient quantity has accumulated; roast them with sufficient heat near the discharging door of the furnace to make them slightly sticky, in which condition they are turned out of the furnace and allowed to cool. This agglomeration is simply to prevent them from being blown out of the furnace as dust.

The roasted matte is smelted in a furnace with a shallow crucible, and with sufficient quartzose ores to flux the iron. If the proper mixture is made, the lead will separate as bullion; the copper will combine with the sulphur left in the roasted matte, making a matte of from 45 to 70 per cent copper, the iron combining with the silica and making a fusible slag. Twelve years ago I had to face the problem of the disposal of a very considerable quantity of these mattes, carrying a large amount of silver, where shipment was impossible. I was able, by running a basic iron slag, to make a very rich copper matte, and to obtain a lead bullion carrying not over 5 per cent of copper. The last product of the furnace, and one which is very annoying, is the smoke and dust which pass out with the products of combustion.

* Condensed from School of Mines Quarterly.

A Fine Map.

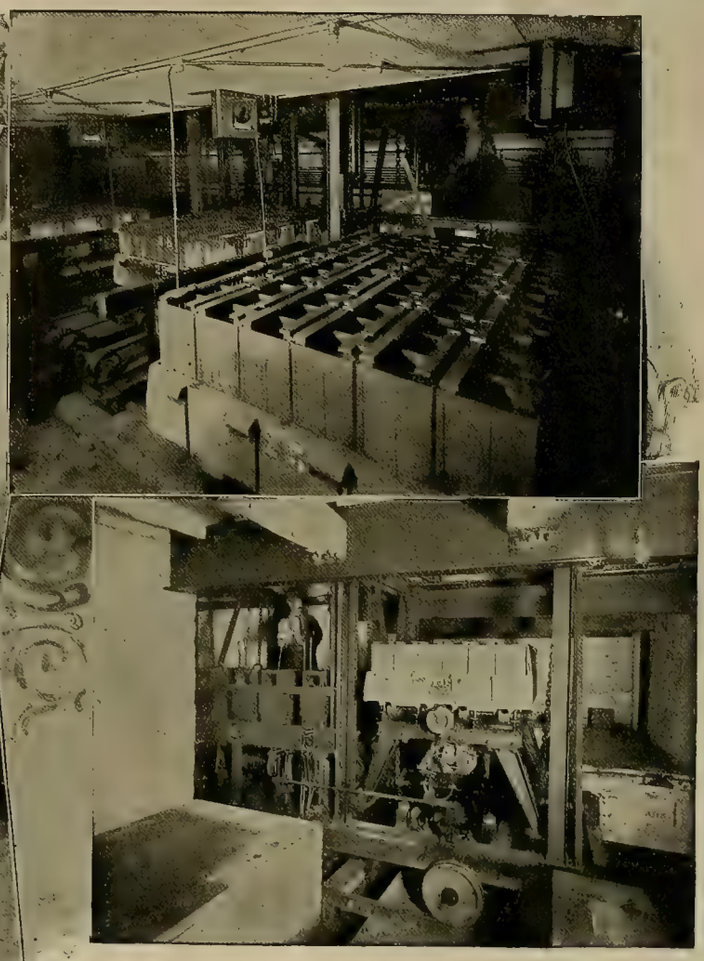
A comprehensive map of the vicinity of Grass Valley and Nevada City, Cal., has been published by Chas. E. Uren, C. E., of Grass Valley, Cal. Mr. Uren has had considerable experience as a civil engineer and mineral surveyor, and is well qualified to give mining men a correct and consequently reliable map of the section above named. The work has been compiled from U. S. Government Surveys and personal observations in the field. The mechanical part of the map is also well executed. The price is $5.

AMERICANS generally credit John Bull with "cute" expedients in accounting for his defeat as a runner of locomotive steam engines. On several of our American railroads the speed recently attained by American-built locomotives surpassed anything of the kind attained on English rails. To account for this our cousins over the water have made a brand new discovery, to-wit: that the American mile is 5000 feet instead of 5280! The same discovery is not yet known in the United States, but several English publications have announced it, and they are using this supposititious discovery "to discount some of our locomotive performances."

Electrical Progress.

Electric Storage Battery Road.

Chicago's new storage battery road is successfully operating twenty motor cars regularly. This road is the first one in this country to have an equipment specially designed throughout for the use of this system of electric traction.



The basement under the car barn is the most interesting part of the entire plant. Here the storage batteries are charged. Several views of this part of the plant are presented herewith. A cross-section of half of this basement shows the batteries arranged on both sides of a central alley, extending the length of the building. The center of the car in the barn comes directly over this alley.

The method of handling the battery trays presents a unique feature. The problem was to remove the discharged batteries at the end of each trip and replace them by a charged set with the least possible delay and with the minimum amount of labor, enabling one man to do the entire work. The elevator is part of a traveling carriage which runs along the track in the alley, extending down through the center of the charging room in the basement. This carriage is provided with two elevators—one at each end—while the middle is occupied by a platform for the attendant, from which he controls the operations. Each elevator is fitted with rollers worked by skew-bevel gearing upon which the battery trays are carried. The charging tables on each side of the transfer pit are also fitted with similar rollers and a clutch coupling is arranged so that the rolls on the elevators may be coupled to the rolls on the charging tables and the trays automatically shifted. There are two of these carriages, one in each charging room, though the present equipment requires but one. Each carriage is provided with five motors—one to operate each elevator, one for each set of rolls and one to run the carriage up and down the alley between the charging tables.

The process of replacing a battery tray upon the car is as follows: The car rounds up into the station from either direction, stopping under the arcade exactly over the pit at the end of the charging room. The attendant below raises an elevator and removes the discharged battery, it being released by the pulling of a lever. On lowering the elevator the entire carriage is advanced a few feet, bringing the charged battery directly under the car truck, to which it can be readily making automatically by means of the plates on its side an electrical contact with the charging circuit. The mechanism of this battery transfer carriage is made entirely interlocking, so that it is impossible to perform two operations at the same time, which would probably prove disastrous. Thus it is impossible to move the carriage until the elevator is lowered from under the car, and the trays cannot be rolled in either direction until the charging tables and the carriage tables are directly in line. The elevators can also be used for placing a charged battery in the car while it stands on the car barn tracks, so that each car on leaving the house is ready for the road. The motors on the cars can also be removed with the aid of the elevators, thus facilitating repairs and inspections. The batteries on each car consist of seventy-two cells, each containing nine plates—four positives and five negatives. The negative plates are all of the "Chloride" type, but part of the cars are equipped with the "Tudor" and part with "Manchester"

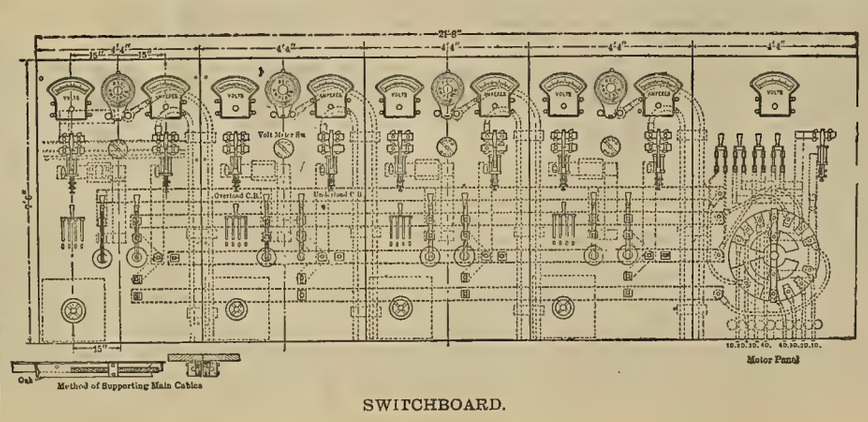
ENGLEWOOD AND CHICAGO STORAGE BATTERY ROAD.

positives. Each plate is 14⅜ inches long and 7¾ inches wide. The negative plates are ¼ inch and the positive plates $\frac{5}{16}$ inch thick. The outside dimensions of the hard-rubber containing jar are 5¼x8½x17¾ inches deep. The weight of the elements of each cell is seventy-five pounds, of the jar five pounds and of the electrolyte twenty pounds, making a total weight for each cell of 100 pounds.



METHOD OF MOUNTING AND CONNECTING ENGINES.

Each tray contains seventy-two cells, arranged in twelve rows of six each. The battery plates are connected by means of lead strips electrically welded, thus making a solid joint. The batteries are arranged in four separate groups of eighteen cells, each group being connected by flexible cables to two large brass plates on the side of the trays. The entire weight of the tray of batteries is 7800 pounds, which makes the extra weight of the car due to the storage cells about four tons. The top of the batteries is covered with a loose-fitting hard rubber crate which prevents the splashing of the acid out of the containing jars. The storage batteries, when in series, will deliver a current of 400 amperes at about 144 volts. Those which have been in service more than six months, and have made over 6000 miles, have yet to show any signs of deterioration. To make the round trip of nearly twenty-four miles takes a car about two hours, which is practically the time each battery is in service. They can be fully charged in forty minutes, but will show a slightly better efficiency if the time of charging is longer. It will thus be seen that it is unnecessary to provide twice as many batteries as cars, as is usually supposed, as the road can be operated successfully with an equipment of battery sets only 50 per cent greater than the number of cars on the line.

It is well known that as a battery becomes charged its electromotive force rises. If the charging voltage remains constant the current received by the battery diminishes in proportion as its electromotive force rises. Thus to charge a cell at a given rate requires a constantly increasing charging voltage. If the final voltage were to be applied to the battery at first in its discharged condition a great rush of current would result, which would be injurious to the plates. It is desirable, then, that the charging cells be subjected to a variation of voltage. To accomplish this without the aid of boosters, resistances or counter electromotive force cells, any of which methods would be uneconomical, the plan of operating three dynamos at three voltages was adopted and is working successfully. Three cables having a common negative return extend from the back of the switchboard along the cells on the charging tables. By means of a plug switch the operator upon the transfer carriage can connect each tray of batteries at will to either cable. The discharged battery is first subjected to a potential of 160 volts, which results in a charging current of about 150 amperes. This current gradually becomes less until, when the attendant observes from the ammeter above the tray that it has reached thirty amperes, the battery is changed to the next higher potential, which is 172 volts. The charging current again reaches 150 amperes and similarly decreases, and finally the battery is connected to the highest potential of 176 volts, where it completes its charge and is ready for service.

The controllers were manufactured by the Walker Company and are of special design for the service, as the low voltage and the large currents used require contacts of much larger surface than are ordinarily necessary. The controller has five points and allows the following combinations: (1) The four sets of batteries in parallel, giving about thirty-six volts; (2) batteries in series parallel in sets of two, giving about seventy-two volts; (3) batteries in series with resistance; (4)

SWITCHBOARD.

batteries in series without resistance; (5) the same, with the field of motor shunted.

The illustration on the opposite page shows two of the generators and part of one engine, and a cross section of the method of mounting and connecting the generators is shown on the same page. Here it will be seen that the generator armatures are mounted upon hollow steel shafts or quills resting in the independent bearings PP and pp. Through the center of this quill, concentric with it but not in contact at any point, extends a solid overhanging steel shaft E, supported also by independent bearings Dd. Suitable flanges and couplings are provided at the ends of the shaft and of the quills to connect with the engine flywheels Hh. It is the interior shaft that is peculiar to the Arnold system and gives to it its flexibility. Normally the shaft is idle and the system requires the movement of no more shafting than usual; but in case it is desired to operate a generator by an engine which is not contiguous to it, the shaft is brought into play and is connected to the engine shaft at one end and extending through the hollow quill is connected to the generator quill at the other end. In the present case the couplings are mechanical and the engines are stopped in a short time when the changes are made. This, of course, introduces no serious inconvenience on account of the character of the load, but in a case where it is imperative to operate the generators continuously magnetic couplings are designed to go with the system, and by this means the generators can be shifted from one engine to another by the throw of a switch.

The entire cost of the power plant, when completed, including boilers, stokers, stack, economizer, cooling tower, condensers, piping, crane, foundations, engines, generators, Arnold system and switchboard, capable of delivering 1000 mechanical horse power, is figured at $86 per horse power.

The one uncertain factor is the life of the plates and the cost of repairs on the batteries. Everything else is certain, and is favorable to success. The roadbed is smooth, level and permanent, and the generating plant is the most economical that can be built. The battery shifting device is automatic and requires the minimum of labor and time. The three charging voltages contribute to an economy in charging the batteries, and the management of the road has been intrusted to experienced and capable men. Of the batteries it may be said that advantage has been taken of the experience gained elsewhere, and that the manufacturers have endeavored to produce a plate which will have long life.

The Abner Doble Company at Fremont and Howard streets, San Francisco, are the Pacific coast agents for the Walker and M. C. Bullock companies, and have installed at the Pacific Power Company a 500 H. P. triple expansion Williams engine direct connected to a 300-kilowatt, 8-pole Walker generator. The machine is used for both power and lighting purposes, and has done good service since its installation, about eight months ago. Owing to the larger size of engine and dynamo, they are deemed more efficient than the corresponding machines used at the Englewood and Chicago station.

Distinction Between Energy and Power.

A trolley wire conveys energy, not power, from the power-house to the motor of an electric car. The energy thus conveyed performs no work except in overcoming the resistance of the wire, till it reaches the motor, wherein it is converted into power, which is expended in the performance of work. The boiler of a locomotive does not transmit power from the furnace to the water in the boiler; it transmits that form of energy known as heat. Strictly speaking, the boiler does no work. By a figure of speech we say a boiler "works well or ill," as the case may be; but when we consult our mechanical and thermo-dynamical definitions, we find no warrant for saying that a boiler works or that it transmits power. What it transmits is energy—a very different thing from either power or work. The steam pipe leading to the steam chest of an engine cylinder does not transmit power; it simply transmits the energy generated in the boiler. Only when the steam reaches the cylinder and the piston moves, energy is converted into work, which, when quantitatively expressed in units of work performed in a specified time, is power. On the other hand, rope, belt and shaft transmission, etc., are each examples of power transmission.—Engineer.

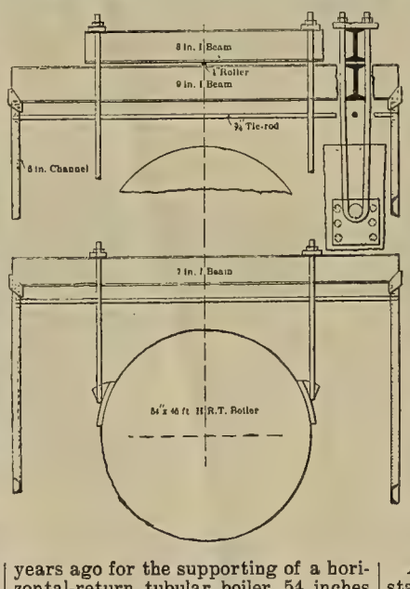
Scientific Progress.

Determining the Points of the Compass.

Methods to determine the cardinal points while on the mountains, in heavy timber and brush or upon the featureless expanse of a great marsh, are numerous and reliable enough for all practical purposes unless a very long journey is to be made, which would make it necessary to hold on a fine point while making so long a distance. Notes on the coniferous trees—pines, firs, spruce, cedars, hemlocks, etc.—show that the bark of these is always lighter in color, harder and drier on the south side of the tree, while it is in color much darker, is also damper and often covered with mold and moss on the north side. The gum that oozes out from wounds, knot holes, etc., is usually hard and often of amber color on the south side, while on the northern side it remains sticky longer and gets covered with insects and dirt, seldom drying out to more than a dirty gray in color. On large trees that have rough bark, especially during the fall and winter months, the nests and webs of insects, spiders, etc., will always be found in the crevices on the south side. A preponderance of the large branches will also be found on the warmest or southern side of the trees; also, the needles of all the abovementioned trees are shorter, drier and of a yellowish-green on the southern side, while they will be found longer, more slender and pliable, damper to the touch and darker green in color on the north side. The cedars and hemlocks, as if trying to outdo the others, always bend their slender tops of new growth toward a southern sky. The hardwood trees are equally as communicative, and have all the characteristics, so far as regards their trunks, as the coniferous trees, except the absence of gums; but this is more made up by the fungus growth of mold and mosses that is very noticeable on the north side of these trees. The ledges of rocks, which may be part of mountains, or merely an occasional cropping out here and there in the woods, or, perhaps, some great boulder alone by itself—a silent witness of the glacial period—all alike testify to the effect of light and shade. The sunny side will usually be bare, or at most only boast of a thin growth of brush, dry kinds of mosses that will only grow when having the light, while the northern sides will be found damp and moldy and often covered with soft mosses and ferns. The forest floor on the sunny side of hills, ridges, clumps of trees, bushes, big rocks, etc., is more noisy under the footfall than on the northern side of such places, where the dead leaves and litter are soft and damp, holding more moisture than in places exposed to the light of the sun.

RECENTLY some interesting repetitions of Franklin's classic kite experiments have been made; but with the improved Hargrave kite, reaching altitudes nearly two miles high, and with this new force the phenomena observed are novel. One of the results shown by a long series of experiments is that the electrical condition of the atmosphere during a snowstorm is practically the same as during a thunder shower, the air being charged to an equal degree. Moreover, at the higher altitudes sparks could be obtained from the kite wire even on cloudless days. That the potential of the atmosphere increases with the height also received verification. Some of the experiments were made from the top of the Washington monument, and during severe thunder storms potentials as high as 3000 or 4000 volts were obtained. Observations, in fact, were recorded at other places—at the top of the Eiffel Tower, for instance—of voltages as high as 10,000.

A FRENCH INVENTOR uses a rubber tube as a core on which to mold pipes of cement and sand. To make a continuous conduit in the ground a trench is dug, and at the bottom of this a layer of cement mortar is placed. On this rests the rubber tube, which is surrounded by canvas and inflated. The remainder of the trench is then filled with cement mortar, and as soon as this is set the rubber core can be deflated and removed for use elsewhere. It is stated that six-inch pipes have been made on this plan out of hydraulic lime and sand at a cost of about 22 cents per yard.



A GLIDING BOAT is a mechanical novelty which has lately been tried in England with success. Two parallel hulls are connected by cross beams, forming a platform on which are placed the engine and boiler. The propeller shaft runs down obliquely into the water. Beneath the hulls are secured flat blades, extending from one keel to the other, and projecting some distance on each side. The flat surfaces of the blades incline slightly upward in front. When the engine is started, the boat gradually rises to the surface; and when a speed of twenty miles an hour is reached, as was realized, only the back part of the blades touches the water.

Mechanical Progress.

A Boiler Setting.

Written by G. W. BISSELL.

The sketch presented herewith shows a method used by the writer about two years ago for the supporting of a horizontal-return tubular boiler, 54 inches in diameter by 16 feet long.

Two pairs of lugs of special design are attached to the sides of the shell above the fire, and at a distance, to centers, of 3 feet 6 inches from the ends of the shell. These lugs rest on hangers of 1-inch round iron, which are carried by nuts on wrought iron saddles cut from 3x1-inch flat bar iron. These saddles rest on I-beams. At the front end of the boiler one 7-inch beam is used. At the back end the saddles are supported by an 8-inch equalizing I-beam 5 feet long, which rests on a 1-inch roller which has a bearing on a 9-inch I-beam. The latter, and also the 7-inch I-beam at the front end, rests on pairs of columns for which 6-inch channel beams are used. Suitable castings serve as sole-plates for the I-beams and as caps for the columns.

Cast iron plates 12x12x1½ inches serve as foot plates for the columns.

These plates are perfectly level on piers of brickwork about 2 feet square, built independently of the boiler setting proper.

Tie rods of ¾-inch round iron hold the columns to place at the top. Longitudinal stability is afforded by setting the channels into the brickwork of the boiler setting, so that the flanges do not project, but are flush with the wall.

It is thought that the following advantages are possessed by this design over others in more general use:

First—Three-point support for the boiler, by which it is freed from strains due to settling of the columns or setting.

Second—Independence of the boiler and the setting, prolonging thereby the life of the setting and making easy the laying up of the new and the repairing of the old brickwork.

The Automatic Clerk.

There have been nearly 3700 United States patents granted on slot machines. The latest is the one recently granted to Mr. Wheatcroft, for his invention, which he calls the automatic clerk. This is the only one of its kind by which bulk can be taken and conveyed to package by the action of a coin. Through the automatic clerk, a grocer can sell peanuts, coffee, biscuits, crackers and starch without the expense of a salesman. The grocer himself can attend to twenty-five of these machines—that is, see about twice a day that they are fully stocked—and be perfectly sure that his profits are not being tampered with. The machine receives the goods at the top in bulk. Peanuts to the value of $10 can be stored in this way. A nickel is placed in the slot by the intending purchaser, and at once a nickel's worth of peanuts passes down a continuous chute, falling thence into a bag, which immediately appears, for the purchaser. To get all this the customer has only to drop his nickel in the slot and pull the handle of the automatic clerk. The machine counts by a register how many nickels are taken, and the grocer can so count his receipts at the end of the day.

The machine is, above all, honest. If a child comes along and puts a penny or a dime in the slot by mistake, the automatic clerk silently returns the coin, as only a nickel can be used. If trade has been unusually brisk and the last of the 1000 bags has been used, a sign appears, saying: "Keep your nickel. This machine is empty." If the silent clerk is placed in the street, woe be to the little boy who should place his hand up the receiving aperture with intent to steal. He will receive a mild, but effective, electric shock that will make him jump.

It has taken the inventor, Mr. Wheatcroft, seven years to perfect his machine, and has cost some $18,000, but he considers himself amply rewarded in the success and utility of his work.

From Tree to Type.

At 7:35 A. M. three fine trees were standing in an Austrian forest. In less than two hours a distinguished assemblage was reading the columns of a newspaper printed on paper made from the pulp of those identical trees. The experiment was made to show the perfection the process of paper making had attained. At 7:35 the trees fell to the ground. The timbers were at once stripped of their bark, cut into small pieces, and converted into mechanical pulp. This was placed in a vat and mixed with the chemicals necessary to form paper, and the first leaf came out at 9:34 A. M., in one minute less than two hours. Some of the sheets were then taken three miles, and the first of the printed papers was issued at 10 o'clock, two hours and thirty-five minutes from the tree.

Answers to Correspondents.

Can you give me a rule for calculating the value of a specimen, when composed of free gold and quartz? For an example, I will say I have a specimen that weighs 4 ozs. Troy, the specific gravity is 36, what is the per cent of gold? C. H. B.

Conconully, Wash., Dec. 21st, '97.

There are several rules for ascertaining the proportion of free gold in quartz specimens, all based on the different densities of the specimens as a whole, of the gold, and of the quartz. The specific gravity of the gold and of the quartz is generally assumed, the former at 17 to 19, the latter at 2.6. That of the specimen is found by weighing it in air and in water, and dividing its weight in air by the difference. In this case, the easiest rule to remember is this: Divide the specific gravity of the gold by that of the quartz and by that of the specimen. From the greater quotient subtract the lesser; the remainder is the proportion of gold. From the lesser quotient subtract 1; the remainder is the proportion of quartz. Then as the sum of these proportional quantities is to the proportion of gold, so is the weight of the specimen to the actual quantity of gold in it. Suppose a specimen weighs 32 ounces in air and 28 ounces in water; the difference is 4, and 32 divided by 4 gives 8, which is the specific gravity of the specimen. If the specific gravity of the gold is assumed to be 17, and that of the quartz 2 6, we have 17 divided by 2 6, gives 6.539 nearly, and 17 divided by 8 gives 2 125. Subtracting the lesser quotient from the greater leaves 4.414, and subtracting 1 from the lesser leaves 1.125; the proportion is 4 414 ounces of gold to 1.125 of quartz. Adding these together we have 5 539. If 5 539 ounces of the specimen contain 4.414 ounces of gold, the whole specimen weighing 32 ounces contains 25 5 ounces. This is correct, provided the assumed specific gravities of the gold and gangue are correct; but, if greater accuracy be desired, proceed thus: Weigh the specimen, a piece of the metal and a piece of the gangue, each in air and water. Divide the difference between the respective weights in air and in water by the weights in air. From the greater quotient subtract the next less, and from that the least. The first remainder is the proportional weight of the metal, the second is that of the gangue; the sum of these is that of the specimen. Having the actual weight of the specimen, that of the metal is easily found, as before.

Suppose a specimen of native silver in spar weighs 84 pounds in air and 73 5 pounds in water; a piece of the silver weighs 27 grains in air and 24 in water; a piece of the spar 20 in air and 12 in water. Then—

Spar in air	20
Spar in water	12
Difference	8 ÷ 20 = 0.400
Specimen in air	84
Specimen in water	73.5
Difference	10.5 ÷ 84 = 0.125

Our claim was located Aug. 30, 1897. On Sept. 8 I gave my partner the paper to record. When he came back to camp in thirty days more I gave him the second, recording the work of a shaft 25 feet deep. He did not send first paper off until he sent last paper, and both were recorded Nov. 1, 1897. I, thinking the first was sent off, wrote the Recorder inquiring about the location. He wrote me it had not come to his notice. Then I told my partner about it. He looked over his papers when he went to town and found it, sent it off and it was recorded Nov. 1, 1897. Now it is all O K. Does the work hold it and make all things right, or must it be relocated to make it a legal holding?

When a location is made any time before May, 1897, does the $100 worth of work have to be done this year or does it take in next year?

Garden Station, Cal., Dec. 28, '97.

Answering the first question, the State law which went into effect May 26, '97, requires that on any California lode mining claims located after that date $50 worth of work must be done within sixty days of posting the notice. If that amount of work was done on the claim before Oct. 30, '97, and proper record made thereof, no relocation will be necessary. Regarding the second question, on any lode claim located after Jan. 1, '97, the $100 worth of annual assessment work required by the Federal Statutes can be done any time before Dec. 31, 1898.

T. T. S., Bodie, Cal.: Cyanide of potassium, 98° in cases of 112 lbs., is quoted at 32 cts. per lb. in New York City. Chloride of platinum, $9 per oz.

G. P. Y., White Hills, Arizona: The population of the United States was estimated by the Treasury Department on December 1, 1897, to be 73,593,000.

F. L. C., Prescott, Arizona: Cyanide of potassium is imported in carload lots from the East, and is not manufactured on this coast. It can be purchased in any reasonable quantity in Denver, Salt Lake City, Los Angeles, or San Francisco. In Los Angeles it is worth at this writing from 32 to 35 cents per pound.

J. W. B., Butte, Montana: Delinquent coowners of a mining claim when served personally with notice, have ninety days from the date of being so served to pay up. In case of publication of notice they have ninety days from the last day of publication, or 180 days from the date of the first publication of notice.

T. C. B., Basin, Montana: There is no "law" to permit the patenting of two or more adjacent and contiguous mining locations by showing that $500 in work and improvement was done on any one of them, but by custom and department usage such action is permitted where it is clearly and satisfactorily shown that such work was for the improvement of the entire claim in common, on the assumption that the mining claim practically includes several lode claims. This is in accordance with a recent ruling, but is not "law" and is liable to reversal at any time.

T. B. F., Downieville, Cal.: The present California mining law went into effect May 26, 1897. Fifty dollars worth of work must be done on lode claims located after that date within sixty days after posting the preliminary notice. On locations made after November 2, '97, it is possible to make the $50 worth of work required under the State law apply and be made part of the $100 annual assessment work required by the United States statutes.

Coast Industrial Notes.

—The manufacture of linen is to be established in the Scotch mill at Salem, Or.

—Portland men have contracted for 5000 sacks of potatoes at Castle Rock, Wash., at 35 cents per sack.

—The Oregon Railroad and Navigation Company has declared a quarterly dividend of 1 per cent., payable January 3.

—Logging camps along the lower Columbia, in Washington and Oregon, show evidences of life and activity, and the price of logs shows an upward tendency.

—Grain elevators are to be built at Flavel, near Astoria, Or. When the Astoria-Gobel road is finished and in operation, wheat will be shipped by vessel largely from that point.

—The Secretary of the Navy has accepted the proposition of the Union Iron Works to establish in the battleship Wisconsin an electric plant for the operation of the turrets and guns and the hoisting of ammunition. The work will cost $11,300.

—Southern California will market 12,000 cars of oranges this winter, about one-half of which will go east over the Santa Fe and the other half over the Southern Pacific, and it is estimated that in five years orange shipments will be two to three times as large. The eastern movement of lemons furnishes a large traffic.

—The shipments of California deciduous fruits for the season 1897 from May 1 to November 30 amounted to 5323 carloads, or 127,752,000 pounds. That was an increase of 1276 carloads over the shipments of 1896, and an increase of 755 carloads over those of 1895. These shipments do not include dried fruits, only fresh fruits.

—Of the 207 shingle mills in the State of Washington, 185 are shut down, and will make no output until after February 1. The daily product of the 207 mills when in operation is 12,560,000 shingles. The mills now in operation have only an output of 1,650,000. By a reduction of the output it is expected to raise the price of shingles from 90 cents to $1.25.

—Imports of merchandise at San Francisco during the first eleven months of '97 were $37,478,300, against $34,073,600 for the same time in '96, and included $8,568,000 from Japan, $6,458,500 from China, $2,244,703 from Great Britain, $9,704,800 from the Hawaiian Islands, $2,635,500 from Central America, $1,600,800 from British Columbia and $1,687,000 from the East Indies.

—President McKinley this week approved the bill prohibiting the killing of fur seals in the waters of the North Pacific ocean, passed by Congress last month. The act prohibits the killing of seals by American citizens, except as they may be taken on the Pribyloff Islands by the North American Commercial Company. It also prohibits the importation of sealskins into the United States, raw, dressed, dyed or manufactured. The penalty for violation of the law is a fine of not less than $200 nor more than $2000, or imprisonment for not more than six months, or both fine and imprisonment, for each offense, the forfeiture to the United States of the vessel, tackle and cargo employed in the illegal sealing being also provided for.

—The S. F. & S. J. Valley Road will bore a long tunnel near Rodeo, Cal. The contract will be let next month. The amount of the contract will be about $450,000. This tunnel is to be 5700 feet in length; the third longest tunnel in California. The longest is that of the Southern Pacific near San Fernando, which is 7200 feet long; the next, that on the Southern Pacific's road to Santa Cruz, which is about 6000 feet long; and the fourth, that on the Southern Pacific's coast extension between San Margarita and San Luis Obispo, a tunnel 4000 feet. The longest tunnel on the coast is on the Northen Pacific line in Washington, 10,000 feet through the Cascade mountains. One of 13,000 feet is to be built on the Great Northern road in Washington.

—There has been a great deal said in the papers recently about the ship-building firm of Cramp & Sons, Philadelphia, locating in Seattle, Wash. These men do not contemplate such an addition to their business, but are anxious to dispose of four vessels that have been on their hands for nearly twenty-five years. In 1873 the Cramps took the contract to build four iron vessels for a concern in South Africa. The vessels were built according to contract and duly registered in Philadelphia. They are of uniform dimensions and of practically the same tonnage capacity. They are named the Pennsylvania, Illinois, Indiana and Ohio. About the time the vessels were completed the steamship company failed, leaving the vessels on Cramps' hands, where they have since remained. The Alaska excitement afforded the builders an opportunity to use the vessels and they were not long in making known that they proposed bringing them to Seattle after giving them an overhauling, and offering them to the Alaska trade. Out of this grew the rumor that they proposed establishing a branch of their great works there. The results are said to be well-made steamships and are regularly listed in the blue book. They are fitted out with modern equipment and probably well adapted to the Alaskan service.

—At Albany, Oregon, the Corvallis & Eastern Railroad has been incorporated; capital stock, $2,500,000. The object set forth is the construction and operation of a railway from Yaquina bay to Snake river in Malheur county, Oregon; also to construct a branch road from a point on the line near Prineville to California through Lake county and the purchase of the Oregon Central & Eastern Railroad. It is said the movement is in reality the reorganization of the Oregon Central & Eastern Railroad for the purpose of extending it eastward. A. B. Hammond, president of the Oregon Central & Eastern, is at the head of the new company and is the chief stockholder. His representatives say he has ample capital at command to carry forward the work. Supplemental articles will soon be filed for the construction of a branch line from a point near Prineville to Pendleton, Oregon.

—According to newspaper accounts, the Alaska Commercial Company has sold its properties to a London syndicate, the British American Corporation, capitalized for £1,500,000. The assets of the new corporation includes the Le Roi mine, Rossland, B. C., and other gold properties. Its principal assets will be the property and business of the pioneer Yukon company, headquarters in San Francisco, including wharves, real estate, warehouses, stores and trading stations for thousands of miles, ocean and river steamers, sailing vessels, launches, barges and lighters, and the whole plant and stock, including merchandise and supplies in transit and at northern depots. Among the properties specified are three stores, with all appurtenances, at Circle City, Forty Mile Creek and Dawson City, trading stores, dwellings and 160 acres of land at Fort Selkirk; townsite property at Dawson City; one-fourth interest in eleven claims on Bonanza and El Dorado creeks; twenty adjoining claims on Bonanza creek; claim 21 on Bear creek; claim 2 on El Dorado creek, which is said to be paying rich returns; claim 2B on El Dorado, and interests in all claims which may be located by parties now prospecting on Stewart and Sweetlarutsk rivers. The English company will continue the mercantile and transportation business of the Alaska Commercial Company in San Francisco, and will engage in banking and mining. Referring to the above, Leon Sloss of the Alaska Commercial Company said yesterday that the British syndidate has no authority to announce that it had absorbed the Alaska Commercial Company. "We have had an offer from the syndicate, but until we see the cold cash there can be no sale. We want no stock; we must have only cash. We are not anxious to sell. We have just let a contract to the Union Iron Works for the rebuilding of the steamer Portland, and the St. Paul, the Dora and the Bertha will all be on the regular and direct run to Alaska."

Personal.

J. A. VEATCH is Supt. Fern mine, Nelson, B. C.

G. EDWARDS is Supt. Mercur, at Mercur, Utah.

F. PRENTISS is Mgr. Boston mine, Sunshine, Utah.

D. FRICOT of Grass Valley is at San Andreas, Cal.

E. T. LOY is Supt. Tennessee mine, Kingman, Ariz.

D. B. HUNT is Supt. Milkmaid mine, French Gulch, Cal.

N. GALLES is Mgr. Swiss Belle G. Co., Galles, Ariz.

CAPT. HALL, Supt. Le Roi mine, B. C., is in Spokane, Wash.

A. C. WHEELER is Supt. Benton mine, near Santa Fe, N. M.

M. K. ROGERS has returned from Mexico to Anaconda, Mont.

J. E. POINGDESTRE of Nevada City, Cal., is in San Francisco.

C. H. WILBUR is Mgr. Golden Eagle mine at Park City, Utah.

J. F. JONES is Supt. White Hills mines, White Hills, Ariz.

H. H. PRICE is Supt. Confidence mine at Whitewater, N. M.

WM. SWANCOAT is Supt. Mineral Point Zinc Co., Hanover, N. M.

A. TURBETT has returned to Salt Lake City from Rossland, B. C.

E. S. THURSTON is Mgr. Squaw Creek mines, Phœnix, Ariz.

H. MATTERN is Supt. Mattern-Ashland mines, Ashland, Oregon.

MGR. ROJAS of the Texas mine, Nevada City, Cal., is in San Francisco.

W. S. SMITH is Supt. Esperanza M. Co., at Guacomea, Sonora, Mexico.

J. S. WOODBURY is Mgr. Spotted Horse mine, Marysville, Montana.

SYDNEY SMITH has returned to San Francisco from Nevada City, Cal.

T. B. DILLON, Supt. Columbia mine, Jackson, Cal., is in San Francisco.

S. G. COLLINS, Mgr. Rialto L. & M. Co., Leadville, Colo., is in Boston.

C. H. DUNTON, Supt. Larkin mine, Placerville, Cal., is in San Francisco.

J. DIAMOND, Supt. Limpensell mine, Placerville, Cal., is in San Francisco.

MAJOR W. H. HEUER, U. S. Engineers, has been in Los Angeles examining qualities and locations of rock in that vicinity in connection with the San Pedro harbor improvements.

J. MEYERS, Supt. Goodyear mine, Mountain House, Cal., is in Sacramento.

O. P. POSEY, Gen. Mgr. Cochiti G. M. Co., Bland, N. M., is in Los Angeles.

C. B KING of Cœur d'Alene, Idaho, is Mgr. Hiyu G. M. Co., Florence, Idaho.

R. C. WALRATH of the Reward mine, Nevada City, Cal., is in San Francisco.

G. SCHMIDT, Mgr. National mine, Buckeye, Cal., has returned to San Francisco.

MASON W. MATHER, Supt. Plumbago mine, Sierra Co., Cal., is in San Francisco.

E. L. WHITE, Victor, Colo., is Mgr. Standard Tunnel Co., Crippie Creek, Colo.

S. B. HAWLEY is the new Supt. of the Mitchell mine at Cripple Creek, Colo.

A. H. TEN BROECK, Supt. Gold B. M. Co., Georgetown, Cal., is in San Francisco.

WM. MCKINLEY, Supt. Providence mine, Nevada City, Cal., is in San Francisco.

H. E. HEPPNER, Mgr. Poorman mine at Lewiston, Idaho, is in Portland, Oregon.

PERCY L. SHUMAN, Mgr. Paragon mines, Mokelumne Hill, Cal., is in San Francisco.

J. M. FRANCIS succeeds his father, J. B. Francis, as Supt. Alma mine, Jackson, Cal.

W. A. HAWLEY of Grass Valley, Cal., has gone to the Cariboo district to take charge of a mine.

LEO VAN ROSENBERG of New York left Dec. 21st for Prescott, Ariz., whence he goes to Colorado.

T. R. JONES, Mgr. Germania smelter, Park City, Utah, has returned thence from San Francisco.

R. A. F. PENROSE, chief owner of the Commonwealth mine, Pearce, Arizona, is in San Francisco.

MR. WALLACE MACGREGOR, chemist and metallurgical engineer, has located in San Francisco.

W. L. HONNOLD, Supt. California Exploration Co., returned to San Andreas, Cal., from San Francisco.

D. B. GILLETTE is Mgr. of the mines recently purchased by the Hearst Estate at Pinos Altos, Ariz.

A. J. CLARK, part owner in the Japan group of mines at Telluride, Colo., will spend the winter in California.

M. J. COMERFORD is Supt. of a 3000-foot tunnel scheme inaugurated by Pennsylvania people at Magnolia, Colo.

A. E. BROOKE RIDLEY, Gen. Mgr. Siemens & Halske Electric Co., has returned to San Francisco from London.

HAMILTON SMITH, representing the London Exploration Company, will arrive in San Francisco from London this week.

J. O. HARRON, Gen. Mgr. and Vice-Pres. the Parke & Lacy Co., has returned from a six-months' business sojourn in Australia.

A. H. RICKETTS, the mining lawyer, has removed his offices to the Claus Spreckels Bldg., Third and Market streets, San Francisco.

SUPT. MILLS of the Merced G. M. Co., was in San Francisco this week with the bullion from the recent clean-up at Coulterville, Cal.

C. E. PALMER is supervising the construction of a $50,000 concentrating plant for the Mollie Gibson and Argentum-Juniata mines at Aspen, Colo.

HORACE F. BURT, third vice-president of the Chicago & Northwest Railway Company, has been selected for the presidency of the Union Pacific Railway Company.

MAJOR L. H. RUCKER, Fourth U. S. Cavalry, has gone to Dyea and Skagway to make investigation of the passes for the purpose of selecting the most feasible route for the Government Yukon relief expedition.

DR. WALDEMAR LINDGREN, of the U. S. Geological Survey, will deliver a course of lectures on mining and metallurgy at Stanford University, but *Science* says he has not accepted a permanent appointment, as has been announced.

PROF. W. B. RISING, Dean of the College of Chemistry of the University of California, has been appointed a member of the American Committee for the Third International Congress of Applied Chemistry to be held in Vienna, Austria, next July. Prof. Rising will be the only representative from this coast.

CAPT. D. L. BRAINARD, who is to lead the Government Klondike relief expedition, is in Chicago, preparing an advertisement for proposals for supplying the food. The advertisement calls for the delivery of 260,000 pounds of food at Skagway not later than February 5th. The more important items are 75,000 pounds of bacon, 112,000 pounds of flour, 5000 pounds of beans and peas, 4000 pounds of butter and 1000 cans of condensed milk. Capt. Brainard says it has been decided not to try to use condensed foods, except milk.

C. B. WINGATE of the Thistle mine, Plumas Co., Cal., who recently went to Scotland to confer with the mine owners there, on his return, recently, went to the Comstock, where he secured an option on the Kinkead milling plant and the C. & C. and Ophir waste dumps, proposing to operate the present Kinkead mill, build another near the Ophir dump, and a cyanide plant, the whole to have a daily capacity of 500 tons. Work was begun, but opposition to permitting a California miner to frame his own timbers and place them in position, on the part of the local Mechanics' Union, has caused a temporary abandonment of the project.

Obituary.

J. F. MAHON, general manager Santa Rita Copper and Iron Company, died at Santa Rita, N. M., December 23.

Mining Summary.

CALIFORNIA.

Amador.

(Special Correspondence).—Work on the Columbia is progressing very satisfactorily. Hon. A. Caminetti, the owner of the property, has bonded it to a San Francisco company. The property had been abandoned in 1878. The new company has pumped the water to the 300 level. The original depth is 350 feet. Machinery has been erected for sinking, with a capacity of 1000 feet. The ledge is known to be 18 feet of low-grade ore. T. B. Dillon is Supt.

Jackson, Dec. 27th, '97.

Republican: The Bellwether at Jackson is crosscutting from the 285-foot level. Fairly good rock has been encountered.

Under the supervision of G. E. Baker, a mill test is being made at the Wieland for ten days. In case the test fails the mine will close.

Work is progressing at the Alma.

Butte.

Two men are engaged developing quartz properties at Union Bar, on Feather river. The ledges show from the water's edge for 200 feet 6 feet wide.

Work is being pushed on the Good Tide mine, fourteen miles from Bangor. A new 10-stamp mill has been erected and ten more can be added, as the new boilers are of 120 H. P. The parties interested are Cincinnati men, who have invested $75,000.

Mercury: Gregory, Cross and Kelly of San Francisco put men to work on the Cherokee property, a part of which Cross, at one time the company's attorney, and Gregory, Supt., located. The men working for Cross and Gregory found their places taken by a force put there by the bondholders' managers, who held possession. Later the Cross men returned, but were not allowed to work. Whether or not litigation will follow, or amicable settlement, remains to be seen.

Calaveras.

In the Thorpe mine at the 600-foot level a large vein of fine-looking ore was encountered.

The San Andreas *Prospect* reports that the California Expl. Co. has relinquished the Gold Hill mine.

J. Tyson has completed assessment work on the Riverside, which presents good indications.

Democrat: During a rise of water in Lost creek, caused by the recent rain and snow storm in the mountains, the ditch of the Forbestown Co. broke near the dam at a point nearly west of Strawberry valley. The break caused a cessation of work in the mines at and near Forbestown, as this water is the only supply they have. A gang of men was set to work repairing the ditch and it is expected water will again be running through it and that the Gold Bank mine, will be started up again soon. The break is about eight miles from Forbestown.

El Dorado.

(Special Correspondence).—Work on the Pine Hill G. & S. M. Co. (formerly the Unity) has been suspended. The property is about nine miles southwest of Placerville and comprises several claims. A great deal of development work has been done on this property. It is owned mostly by South San Francisco people, with whom capital, excepting a few, is not an unknown quantity. The reason for discontinuing development work on this hitherto encouraging property is said to be domestic trouble and a disinclination on the part of one of the holders to furnish all the capital.

Shingle Springs, Dec. 25th, '97.

(Special Correspondence).—The ten stamps on the Boulder, seven miles northwest of Shingle Springs, are dropping continuosly on very good ore, from a ledge of more than ordidary size, and at a depth of about 700 feet.

Creditable rumor states that Robinson & Berry, of Placerville, have finally bonded the old Greenstone, located about two miles east of Shingle Springs. Data obtained from a quondam Wells, Fargo agent place the product of this property years ago at almost fabulous figures. The location is not such as would indicate a gold mine, but its past history as a rich producer is beyond question. There is no vein on the surface. An old shaft was sunk in the serpentine, but no depth of consequence was attained. The systematic re-opening of the property is looked forward to with much interest.

Placerville, Dec. 28th, '97.

(Special Correspondence).—Supt. Keeney of the Ohio, near Greenwood, has found a good sized ore body at a depth of 300 feet, of a very fair grade. Perseverance and a prudent outlay of capital have finally achieved success.

The Lucky Marion, owned by a St. Louis Co., has closed, apparently for the lack of capital.

Greenwood, Dec. 26th, '97.

Republican: It is reported that the Gentle Annie mine has found an 8-foot ledge on the 400 level, and is in the midst of a pay chute that gives indication of being a large deposit of ore.

The Selby is down 213 feet and drifting.

At the Darkin the depth is 250 feet. The five stamps have been running on ore from the 100.

An arrastra is operated on Webber creek by Sacramento men, working tailings from the old Tin Cup mine.

Supt. Husband of the Gopher-Boulder has completed a test run. The results were good; he has cabled the information to the English owners. It is probable they will go on developing.

Kern.

A 20-stamp mill and cyanide plant are to be erected at Kramer for custom work.

Miner: Eight tons of ore from the La Crosse mine produced 53½ ounces of gold, valued at $800. The La Crosse is in the Stringer district.

Nevada.

(Special Correspondence).—Despite conservative overtures and efforts to secure our valley neighbors against harm, it seems we are destined to be continuously hampered by unfriendly agencies in our desired legitimate pursuit of gravel mining under the laws both State and Federal.

The debris from the several properties about You Bet have seven miles to flow before reaching Bear river, and probably fifty miles before reaching the Sacramento. At Colfax there is a dam 30 feet high, built in 1853, proving the possibility of securely building restraining dams. The output of gravel by hydraulic elevator process and by the construction of dams, all of which the property owners are ready to do, could not injure our neighbors in the valley.

We are ready to protect them against harm to their lands, and are desirous to extract the wealth stored in our hills.

Were the Government to purchase the valley lands, contiguous to the river bottoms and allow them to be overflowed, they would command a better figure than they do to-day. The Government might tax the mine owner on his output, whether by land measurement or otherwise, and he would be the last to object and the first to comply.

There are here to-day over 4000 acres of gravel that can be operated by either the drift or sluice process, of which each cubic yard will average 20 cents, and every acre will average 150 feet of pay dirt.

We look of course to Government for some relief in this matter through the building of dams and the operation of dredges, but "how long, O, Lord, how long?"

The mountain debris from this winter's snows will carry in their course much of the tailings, piled 75 feet high before the Sawyer decision, and this in the summer season is charged to sluicing at the Red Dog and You Bet mines.

You Bet, Dec. 26th, '97.

(Special Correspondence).—Work on the Gothard, together with the Delhi, which was recently purchased by the Champion Co., of Nevada City, for $25,000, is progressing rapidly. Supt. Bigelow has eleven men at work, and will increase the force as circumstances permit. The old 1000-foot tunnel is being extended 500 feet, and will cut the vein at a depth of over 800 feet.

North Columbia, Dec. 26th, '97.

The hydraulic North Bloomfield mine will prove an attraction at the Golden Jubilee mining fair.

Placer.

The directors of the Pioneer M. Co. expect to declare a dividend at the quarterly rate of 25c a share, or 10% a year on par of $10. The company has about $130,000 in its treasury. The November statement of the company showed that the average value of the rock mined was less per ton than it had been for the preceding five months, or $15.79 against an average of $19.25 for the five previous months. They consider that $10 ore will meet every requirement and expectation.

The Gold Standard gravel mine, north of Towle, looks promising. A bedrock tunnel is being run. Gravel was encountered in the top of the face of the tunnel, at the 40-foot mark, showing pieces of gold as large as $3.

The Bear River Hydraulic Co. closed for the season because of the winter freshets. As soon as the water will permit work will be resumed.

Herald: Considerable development is going on in old and new claims in the Ophir district. J. Butts is sinking a new shaft near Ophir. He is down about 20 feet.

The Belleview shows encouraging prospects. Brye & Lozano are the owners. A recent clean-up netted them something over $1200.

O. Walters is getting good ore, and the Bowlder, of which C. C. Handy is owner, is running a force, and the prospects are promising. The Gold Blossom is putting in machinery.

Plumas.

The North American, one of the Garnett Con. Co 's properties, has closed down.

A company from New York has united with G. E. and A. E. Shinn to incorporate the Plumas National M. & I. Co. Capital stock, $25,000, of which $5,000 is paid. The purpose is to develop the mine below Spring Garden, and other properties.

Riverside.

The mass of tailings accumulated at the Hoag mine were leased by Bates & Langford, who erected a cyanide plant, a small ten-ton affair. The tailings net a profit of $5.40 per ton; the price for treatment is about 60 cents. Ten tons are treated every day. Mr. Langford took to Los Angeles last week forty-four ounces of gold, worth $18.75 per ounce, $800 for a seventeen days' run.

San Diego.

The new mining town of Camp Todd is in the San Mateo canyon, three miles from its mouth. The district is named Defiance, J. P. Small of Murietta recorder. The district lies in the extreme northern part of San Diego county, and is bounded on the west and south by the Santa Margarita grant, and on the east by the Santa Rosa grant.

Shasta.

The hills are full of prospectors about Whiskytown, and all doing well.

The Jim Dawe mine, near Shasta, was recently purchased by Page, and is being developed.

R. Howk is Supt. of the Mt. Shasta, near Shasta. They are drifting and getting out good ore.

N. Johnson, near French Gulch, has two tunnels on different leads, each 100 feet in on the ledge. The vein averages 16 inches and the ore prospects well.

A tramway will be built from the Elder Bros'. mine to the Iron Mountain railway to facilitate the delivery of 25,000 tons of ore contracted for by the Mountain Copper Co.

Sierra.

(Special Correspondence).—T. F. Garnier has secured a bond on the Homestake, two and a half miles north of this place, and will begin work immediately. There is an 8-stamp mill on the property. The tunnel, 500 feet, cuts a 4-foot ledge of fair grade ore. Work was abandoned on this mine two years ago, consequent upon the owner's death.

Forest, Dec. 26th, '97.

A new tunnel has been started on the Mt. View, near Downieville, to tap the shaft.

The Downieville *Messenger* reports an encouraging strike in the South Fork mine.

Messenger: Fifteen men are employed at Gold Bluff. The mill was started last week.

York & Sons have been crushing ore the past week.

C. York has six men engaged at the Mount Vernon gravel mine, and will continue work there all winter.

Siskiyou.

(Special Correspondence).—A Montana company is prospecting on Scott river, with a view to erecting a dredge. The prospecting work is extensive and sympathetic and if the results are satisfactory the dredge will be constructed in the early spring. The parties are undecided between the Montana and California dredge. The company is operating twenty-seven miles from Yreka. L. D. Graeter, Callahan P. O., is managing the work.

Fort Jones, Dec. 26th, '97.

Journal: The Fernandez placer claim on Cherry creek is ready for a big run as soon as they have water. This is supplied from the snows of Deadwood mountain.

Work at the Blue Gravel mine on Greenhorn is progressing. A new shaft is being sunk to increase the force.

A. Wetzel is driving a shaft at the Katie-May on Greenhorn. The ledge is small but good.

Work is progressing at the Spencer on Humbug in running a tunnel at 600-foot depth. As soon as the tunnel is extended power drills will be brought into requisition.

News: The King Solomon mine will erect a 40-stamp mill next spring, as they find the ore bodies so large as to justify work on an extensive scale.

R. M. Shearer of Cincinnati, O., has purchased the Cartwright & Phillips mine, located at the head of Humbug.

Reporter: On Salmon river, Swain, Newsome & Cleaver have a 5-foot ledge from which they are taking $10 ore.

At the Jumbo, Sawyer's Bar, a 10-stamp mill is running regularly. The ore is low grade, but the ledge is large and handled at small cost.

The Hickey Bros., at Sawyer's Bar, have fitted up with pipe and giant.

The Shumway Bros., Chase and Reed, and K. Dorothy are at work near Sawyer's Bar.

The Hamilton, Smith & Bills hydraulic mine at Sawyer's Bar is being worked under the management of John Hamilton.

The Peterson hydraulic mine on Salmon river has started.

Wm. Burns' giant is kept at work steadily at Sawyer's Bar.

Herbert Finley from a hundred tons of ore netted $28 per ton.

James Tonkin has leased the Fagundez quartz mine below Sawyer's Bar, and is driving a tunnel.

At the King Solomon work has been completed. They begin crushing Jan. 1st; a porphyry dike seamed with quartz of high grade.

The Dannenbrink Q. M. Co., on Knownothing creek, keep their ten stamps busy.

The Salmon River H. M. Co. has purchased and put in operation the Kline and Harris Bros.' properties, and bonded the Moore claims. The latter will require an elevator. A ditch eight miles long was brought from Salmon river, which is being extended to Sawyer's Bar, a distance of five miles. They expect to expend $60,000 fitting up this property. C. S. Fitch is Supt.

Journal: H. H. Hunter & Co., at the Nebraska, have a tunnel 190 feet along the ledge at 250 feet depth. The ledge is 14 inches.

H. Schroeder, of the Deadwood mines, has tapped two additional ledges. A mill is to be erected in the spring.

Billups & Thomas are washing old ground at the Greenhorn on percentage and making wages.

Trinity.

A. P. Haskin has begun hydraulicking near Trinity Center. His property comprises ninety acres. The gravel is from 10 to 30 feet in depth.

Journal: At North Fork C. and G. Schlomer have begun work.

At Cox Bar T. Price has resumed operations on his drift claim.

G. Tinsley is drifting on Manzanita Flat with good results.

The Patterson Bros. are working their hydraulic mine.

T. C. Wright has completed the ditch on the mine at Vance Bar and will commence operations at once.

Chinese are working extensively at Skunk Point and on the old Willshire mine.

At Taylor's Flat the Red Bluff Co. is working day and night.

At Antone's Point C. Kinderman is running a drift claim. He works all the year round and handles the water in the drifts by a pump worked by a gasoline engine.

The Huestis Bros. have leased the Don Juan placer mine to Uhlberg & Campbell. This comprises 100 acres and is well equipped.

Stetson & Southern are ground sluicing.

W. D. Moody has a bank of gravel containing forty acres, which he is working.

At Cedar Flat the Trinity P. M. Co. has resumed work, under Supt. Harvey.

Tuolumne.

At the Potato Ranch mine, the property recently bonded by Wm. Sharwood, drifting is being prosecuted north and south on the vein from the 100 level. The vein is 7 feet, heavily sulphureted and of high grade.

Sinking at the Grizzly continues in the new shaft. Progress is being made in high-grade quartz.

Gen. Mgr. Buckminster of the Santa Ysabel G. M. Co., has returned to Boston from his visit to the mine.

Reports from Cherokee continue favorable. The tunnel in the Philadelphia ran into a body of high-grade ore. The Carlotta G. M. Co. continues taking out ore and will ship a carload this week.

In the McNear mine sinking is carried on.

Work has been resumed on the Washington on Indian creek.

The Green, near Shaw's ranch, is being worked again.

The Sell mine has 22,000 tons of ore on the dumps, which it is claimed will work $8 to the ton. A 10-stamp mill is to be erected at once.

The Ready shaft is through the pay chute 200 feet, striking a good vein 5½ feet.

Democrat: A piece of float quartz was found by Ackerson & Phelan, recently, three-quarters of a mile from Corcoran Flat. The finders set out to prospect for the ledge the quartz was broken from and found a big vein, but cannot yet determine if it is the one they are looking for.

Independent: The Dead Horse is employing forty men and taking out considerable ore.

O. C. Wilbur is opening up the Stanley and Gladstone, near Jacksonville, with encouraging results.

At the Lady Washington development is reported satisfactory.

The Harriman G. M. Co. is sinking on good rock in the Skinner and Sonora, near Jacksonville.

The Pennsylvania and Carlotta have been producing rich rock for several weeks.

The Confidence mine is going down on the old shaft.

The Providence is pushing development vigorously.

The 20-stamp mill at the Maryatte, near Tuttletown, is nearing completion. The mill will be run by water and 4000 feet of pipe will have to be laid.

The Arbona has resumed operations, and the new 10-stamp mill will be started on its work permanently at once. The hoisting works were completed last week, and it is the company's purpose to go down 1000 feet on the ledge.

A 10-stamp mill is to be completed and in running order in thirty days on the Sell mine, near Sonora, recently acquired by the Tuolumne County M. & D. Co. of Fresno.

Democrat: Work has started on the Terzich. The property is owned by M. Terzich of Sonora, who has organized a company, and, with himself as Supt., operations are pushed. The vein is a pocket and free milling proposition. The mine has been developed to the extent of two shafts, each 150 feet deep, and three tunnels, each 150 feet. The vein has an average width of 4 feet. It is the intention to erect a mill.

N. W. Moodey, Pres. of the Tuolumne M. & D. Co., says a 10-stamp mill will be erected on the Sell mine; 20,000 tons of ore are on the dump; average, $8 per ton.

Work on the south extension of the Providence has been resumed on the main shaft, which is 75 feet and being driven at the rate of 8 feet per day. A 25-foot crosscut tunnel was run to tap the vein and the latter drifted on for 125 feet. There is 20 feet of vein matter, including 14 inches of quartz, that mills $8.50 per ton in free gold, besides rich sulphurets.

The shaft on the Free Coinage is 100 feet, and crosscutting has commenced for the vein. The mine has no mill nor hoisting apparatus. J. M. Haskell is Supt.

Ventura.

On Dec. 25 fires were started in the furnaces of the California Asphaltum Co. and the works assumed their former activity, having been shut down three months to make extensive improvements.

Yuba.

F. W. Page, Mgr. of the Brown's Valley mines, has again assumed charge. The directors of the corporation have refused to accept his resignation. Work is still going on in the 800 and 900 levels of the Pennsylvania, which belongs to the Webb Co., and they are running drifts to get the pay chute which was so extravagantly rich from the top level to the 700.

H. Davis, prospecting at Brownsville, recently came upon a 40-lb. chunk of quartz showing free gold, occasioning considerable interest in that section.

W. Wolf of San Francisco is developing a quartz lode near Dobbins, and will place a prospect mill on the property at once.

M. Beever found another pocket at Rackerby and the first day took out $100.

Democrat: J. Johnson has transferred forty acres and a quartz claim in Brownsville district to J. A. Poingdestre, who has also bonded the Miller claim. Both have been worked to a depth of 50 feet and the prospects are very good. He expects to erect a mill, hoisting works and cyanide plant.

At the Johnson mine, near Brownsville, working under bond by J. C. Campbell, ten stamps are kept busy; at the same time men are putting in a cyanide process. The difficulty in this claim and others in the Brownsville district has been to save the fine gold.

NEVADA.

At the Chainman active work is in progress. The management is erecting a mill. The ore averages about $15 in gold per ton.

The Robust at Ely is being developed, and has a shaft 75 feet. At that level they uncovered 5 feet, showing $12.50 per ton in gold.

The Jupiter at Ely has a shaft 60 feet and ore running $18 a ton. Next season a mill will be erected. D. Peters & Co., Ely, are the owners.

The Johanna shows ore that runs $36 per

ton. The deepest workings are less than 60 feet.

W. J. Nelson, Mgr. Boston-Nevada Copper Mining Co., Yerington, says his company is working but fifty-four men now, but shortly will have many more at work. He says the mill will start up again this month. His payroll at the present time amounts to $9000 a month. His company has spent $112,000 on the mill and mine.

The Chainman mill has resumed operations. T. Smith, from Angels, Cal., is in charge. On the payroll are 75 men.

OREGON.

Ten tons of ore from the Free Coinage produced twenty-one ounces in gold. The concentrates went $150 per ton. The ledge is 3 feet wide and is seven miles east of Ashland.

Hawley, Plummer & Corbus have bought Sharp Bros.' nine placer claims on Powell creek near Ashland for $10,000 and are working them.

The new strike in the Tom Paine mine, near Baker City, assays $25.83 per ton.

At the Worley mine, near Granite, they are sinking 300 feet and preparing for a 10-stamp mill to be erected in the spring.

There are twenty-five men at work in the Belcher, which was purchased for $30,000 by a Utah company.

The Virginia is sinking on the ledge.

The clean-up after seventeen days' run on the Braden, near Gold Hill, was 100 ounces of gold.

Beekman & Huffer are in 300 feet on their tunnel.

The Powell Creek placer mine was sold on the 18th to J. H. Hanley, H. B. Plummer and B. F. Mulkey for $10,000. It is twenty-five miles west of Ashland and embraces 200 acres.

W. H. Reed has purchased the Hammersly mine and is pushing work. A drift was started on a vein 8 inches thick, which has increased to 2½ feet, and the rock runs $75 to the ton.

The Browning & Hannum, on Grave creek, in southern Oregon, has a 2-foot ledge at a depth of 100 feet. Since May 1st it has produced $8000.

Batchelder & Pracht of Portland are the purchasers of the Ollie Woodman mines at Sparta.

Miller & Lane of East Eagle have struck a large body of good ore.

Rich ore was unearthed in the Grey Eagle near Sparta, which J. A. Wright is developing.

The placer miners at Sparta expect to begin piping February 1.

WASHINGTON.

The first shipment from the Cleveland mine at Springdale, under Leason & Tinsly, was made last week.

There is much activity on Toulou mountain, six miles from Bossburg. The mountain is said to be a mass of mineral and is covered with claims, of which the Scotia is one of the best developed, with 180 feet of tunnel and a 56-foot shaft. A diamond drill is to be added to the equipment. A notable strike was made on the Nickel Plate, which showed up a good ore body. The Clyde-Mohawk Co. is operating with a full force.

Development on the Silver Dollar at Bossburg is showing galena running thirty ounces in silver.

In Springdale, seventy-five miles from Spokane, much development is in progress. The claims are generally high grade, silver-lead propositions predominating; some bodies of copper ore have been discovered varying from 2½ to 45 per cent copper and from a trace to $10 in gold.

G. B. Henton of Ellensburg recently expressed ninety-two ounces of gold nuggets from the Elliott mine, near Springdale.

A. Marsh found a nugget weighing 4.9 ounces on the Salmon river, Idaho.

BRITISH COLUMBIA.

Farrell & Midgeon's mining interests at Boundary Creek passed under the control of McKenzie & Mann. The price paid is upwards of $100,000, and 25 per cent has been paid in cash.

The shaft on the American Eagle at Grand Forks shows a vein of 6 feet that assays from $20 to $60 in gold.

G. E. Pfunder has lifted the bond on the controlling interest in the Virginia at Rossland at 12½ cents per share, putting a value on the mine of $62,500. A 6 cent assessment has been levied, creating a working capital of $30,000 to push the work of development.

Four mines are shipping through Silverton—the Comstock, Vancouver, Fidelity and Silver Nugget.

The Stranger at Kaslo shipped a car of ore last week.

The sale of the Curlew at Rossland was made last week for $30,000 cash to an English company.

The International Gold-Copper M. Co. of Rossland, floated last year with a capital of a million, has gone to the wall. Stock was offered at 3 cents, and it has been declared that $12,500 of shares was sold.

The thirty days' run of the Golden Cache mill, Lillooet, gave 900 ounces amalgam from 750 tons milled. About 75 per cent of gold will be saved on the plates. The clean-up will average $4.50 per ton.

The Red Eagle M. Co.'s plant at Rossland has been sold by the sheriff to J. W. Boyde for $2184.40.

The Wasa group at Rossland has been bonded to H. Croft of Victoria for $20,000.

W. Braden of the Pilot Bay smelter says that about 2000 tons of ore so far has been milled and the result is over 500 tons of concentrates, which will probably average from seventy-five to eighty ounces in silver and 70 per cent lead. The ore that has been milled comes from the Lucky Jim and Tariff mines and some from the Blue Bell. Ore has been struck at the lower or 300-foot level of the Tariff mine, and at that depth the ore body is 3½ feet wide, assaying about forty-five to fifty ounces in silver and 76 per cent in lead. The ore on the surface showed a width of 18 inches. The level so far is the lowest obtained in the Ainsworth camp. The aerial tramway, 1500 feet long, from the mine to the lake is completed and is in good running condition. It is bringing down about fifty tons per day. The Tariff mine is employing thirty men. The Lucky Jim is down to a depth of 280 feet and shows 10 feet of ore. The vein has varied from 4 to 14 feet in width and a vast amount of work has been done on it. It is twenty miles above Kaslo and a 1200-foot tramway carries the ore to bins on the Kaslo & Slocan Railway. Twenty-seven men are employed and about 100 tons per day is being brought down. The ore concentrates about four to one. The capacity of the concentrator at Pilot Bay is 200 tons per day, and as a result the Blue Bell mine is not being worked steadily.

The Le Roi Co. made payments of $21,000 last week on its new smelter at Northport. Construction of the smelter was begun in August, '97. Since then the Le Roi has paid $200,000 in dividends, built a $100,000 smelter, and expended about $10,000 in permanent improvements at the mine. The company has decided to pass the usual monthly dividend, as the completion of the smelter will stop ore shipments to the outside smelters, and the company will also have to set aside a fund for the operation of the new plant and the purchase of ore. The ore in the lower workings of the mine carries a large percentage of silica, and to treat this ore advantageously the company will buy ores from other mines which are heavier in iron and carry a smaller percentage of silica. At the start it will also want some ore heavy in copper. A large fund will therefore be required to carry the company's own ores and the ores it will buy from other mines. It is expected that the smelter will start Jan. 15th. The Le Roi Co. has practically completed its 75,000-ton contract with Heinze, and from now on will deliver its entire output of 250 tons daily to its own smelter. It has been rushing deliveries to Trail to complete this contract, and the smelter there will have 13,000 or 14,000 tons of ore on hand when the Le Roi makes its last delivery.

The Payne mine employs 120 men, the largest of any mine in the Slocan. The Idaho employs sixty-eight men.

THE KLONDIKE.

Klondike gold runs from .760 to .835 fine in gold, from 160 to 235 fine in silver and averages about five points base metal. The amount of government mint charge is one-eighth of one per cent of the total value for assaying. A charge of $1 per 1000 ounces, and from 1000 ounces, one-tenth of one per cent per ounce is made for melting. For bullion 700 fine or over, there is a charge of four cents per ounce for refining. A charge of two cents per ounce is made for 1-11th standard weight for alloy. Passengers who left Dawson City Nov. 27th are inclined to discount the stories of starvation there. They say the food situation at Dawson is not alarming, that there is more alarm over the situation outside than is felt by the people at Dawson, who, while they have not a surplus, have sufficient supplies to last them until in the spring. Whatever danger of starvation existed has been averted by the exodus of a large number of people from Dawson to Fort Yukon and the departure of a great many people up the river to the coast. The most serious shortage is in candles and oil. They report that recent prospecting on Hunker creek proves that it will rival El Dorado and Bonanza creeks. At Forty-seven, above Discovery on Hunker creek, the pay streak is found to be 80 feet wide, with 4 feet of gravel, averaging $4 to the pan. At Fifty-one, below Discovery, the pay streak is claimed to be 280 feet wide, with 4 feet of gravel, running from 25 cents to $6 to the pan. The Hunker creek gold is also said to be the best quality found in the district. On Dominion creek prospectors have taken out as high as $17 to the pan, but the gold is in streaks. Skookum gulch is also peculiar in the fact that all the gold found there is in nuggets. Speaking of the rush to file claims, one of the late arrivals on the Alki, who left Dawson City Nov. 27th, says: "For some time before I left the Commissioner's office was unable to accommodate the miners. The men stood in line for days with the mercury 40° below zero in order to file." Beef and mutton at Dawson are being sold at $1.50 per pound. Nothing in the food line can be obtained from the companies without an order. Flour was selling from outfits at $100 per sack, while bacon and beans brought $1 to $1.25 per pound. There was plenty of sugar at 30 cents per pound. The claims are all taken to within a radius of forty-five to fifty miles of Dawson. About 300 men are camped at the mouth of Stewart river, which stream they will prospect this winter. No new gold discoveries are reported. The amount of gold brought out from Dawson by those on the Alki is estimated at $50,000.

ONTARIO.

R. McMillan of the Mikado mine, near Rat Portage, reached town within the past few days, bringing with him a box containing the results of the last run of the Mikado mine—six bricks aggregating $13,000.

A. Nash possesses in the Nyzam mine near French Narrows a low-grade proposition; the vein is 7 feet, assaying from $3.50 to $8 per ton.

UTAH.

On the Eureka Hill, Tintic, which has produced several millions, the shaft is 1100 feet; an air compressor, piping for the shaft, which is to be 6-inch double screw, 3000 feet of smaller pipe for the different levels, and twenty additional stamps, with necessary tables and pans, are to be added.

Since the Overland has been conveyed to Gill S. Peyton, and the Malvern to P. J. Donohue, at Mercur, the district has assumed new life.

The Moonshine group of seven claims at Mercur has been sold to D. W. Kimball of Boston, who has men at work.

The controlling interest in the Malvern M. Co. at Sunshine was transferred to London people through P. J. Donohue, the purchasers paying on a basis of $150,000 for the property.

F. K. Bodine on the Bimetallic at Five-Mile Pass is putting down a shaft 300 feet.

J. Dean is developing the property of the McKinley M. Co. at Ophir.

Development on the Shoebridge-Bonanza at Silver City has begun.

T. G. Merrill has let a contract for work on the Gracie, part of the Pocahontas group, Silver City, and started work.

Drake & Anderson let a contract for work on the Murray Hill group.

Work of sinking on the North Star, at Silver City, has resumed.

The Homestake has reached a depth of 500 feet

Sinking on the Buckeye, at Silverton, has resumed and will continue until the 600 is reached. There is some good ore on the 400 level, showing gold, silver, lead and copper.

IDAHO.

The Poorman at Lewiston will have a 5-stamp mill in operation by March 1st. The Poorman has a tunnel on the ledge about 400 feet. The ledge is 4 feet wide, about half the ledge being a pay streak on the hanging wall. Assays show $85 in gold and $65 in silver. There are five stamp mills in the camp, and it is said that next season will see the number doubled.

The Monolith mine at Shoup is said to have encountered a 2-foot ledge that will prove one of the best bodies of ore discovered in the State.

J. Schoner at Grangeville has six locations, on all of which good quartz has been found. On the Yellow Rose are a 103-foot tunnel and a 30-foot vein, a 30-foot tunnel on the August Flower with a 3½-foot vein and a 40-foot tunnel on the Grangeville, with a 3-foot vein, which is said to assay $87.95 gold per ton.

MONTANA.

The number of men employed in and about the mines of Butte is at present about 5000. They are divided as follows:

Anaconda mines	1600
Boston & Montana	700
Parrot	400
Montana Ore Purchasing Co.	300
Colorado	300
Butte Reduction	350
Alice Co.	225
All others	1100
Total	4975

WYOMING.

The Dillon mine at Rawlins is now in condition to supply the increasing demand for its coal.

A copper vein 10 feet wide has been reached in the Charter Oak mine, owned by the Seton Karr syndicate, in the Battle Creek copper district. The ore is rich in copper and carries $5 a ton in gold.

COLORADO.

There are four leasers in the Giles M., Cripple Creek. At the point of the strike there is a pay streak 30 inches wide, one-third of which is of smelting quality, and the other portion good mill dirt. The smelting ore averages $73 per ton in gold.

The Morning Star for the past year has yielded $5,000 per month.

Whiteside, Summers & Co., on the Vindicator, received from their first shipment $118, $54, and $20 respectively.

The Herrington is producing an average of twenty-five tons a day, making the output between $1,500 and $2,500 a day.

At Sunnyside two deals were consummated last week. One was by K. McDonald and S. Sargent, of the Pennsylvania mining property to a company of Boston men, the purchase price being $50,000, with a payment of $15,000.

The sale of the Silent Friend was closed within the past few days to Eastern men.

Pennsylvania capitalists, headed by S. Heilner, the coal baron, have undertaken to run a tunnel into Magnolia hill, a distance of 3000 feet. The tunnel at 40 feet cut a lode of whose existence no one knew. The object is to cut the Pickwick group of mines low down. At present hand drilling is being done, but plans are being made to put up a large water power plant at the mouth of the tunnel and use compressed air drills. A dynamo for lighting purposes will also be put up. The tunnel is double width and has two tracks. M. J. Comerford of Magnolia is Supt.

The Rialto L. & M. Co., a Boston company, has let a contract for 500 feet farther on Iron hill, Leadville. They have erected machinery at a cost of $8,000, and propose to go down until the underlying wealth of the camp is demonstrated.

The Strong, at Cripple Creek, is making shipments, averaging twelve cars per day, ranging in value from $40 to $70 per ton.

Returns received from two shipments from the Gold Sovereign, Cripple Creek, ran fifty and twenty-seven ounces per ton.

Carruthers & Levy, of Cripple Creek, are producing five tons per day, averaging three ounces.

Redd & Co., of the Australia, on Beacon hill, have opened a vein 2 feet wide, assaying from $18 to $26 per ton.

The Puritan, at Yankee hill, is shipping $60 ore from an 18-inch vein.

The Maggie Trimble, at Yankee hill, is showing a 4-foot vein of from $20 to $40 per ton, at a depth of 12 feet. The shaft is to be sunk and machinery put on.

The Bonanza King, at St. Mary's lake, has a 4-foot vein of copper ore.

The Specimen shipped during the past week fifty tons of ore of an average value of $43.

The Alice property, at Yankee hill, was sold for $250,000, and the Cheasapeake for nearly $30,000, to Eastern investors.

It is reported that the Star of the West, at Silverton, has been purchased by a California company who propose to develop the claim, and expect to take in the Pyramid, Demosthenes, and several adjacent. The company proposes to build a fifty-ton concentrating mill. A. B. Elis, the Gen. Supt., says the work will begin at once.

The old producers at Ouray, the Bachelor, Wedge, Revenue, Camp Bird, O. and N. Tunnel, American, Nettie and others are keeping up their daily shipments of ore. The Bimetallist has been added as a shipper.

T. F. Walsh, in connection with his Camp Bird mine, is about erecting a large mill for concentration of low-grade ores near Ouray.

The Big Six mine at Leadville struck a 2-foot ore body, assaying eighty-nine ounces silver and a fraction in gold. There are two tons blocked out that will run $1800 in silver to the ton.

The tunnel in the Eldora at Boulder has been driven 80 feet, and the vein encountered is a solid mineralized body 4 feet wide, representing in value $800 per ton.

The year's production from the Vindicator, Cripple Creek, will aggregate 9000 tons, with an average value of $35 per ton.

Fifty leading mining men of Colorado met in Denver last week to organize an association for mutual benefit. The association proposes to have jurisdiction over everything pertaining to the mining industry which may affect more than one mine. The matters of freights, smelting charges, milling rates, labor compensation, etc., will all be considered, and the relation of railroad rates to ore values will receive special attention, so that no matter where a mine may be located, it will receive protection to the full power of the association.

A Denver dispatch of Dec. 29 says: The books of the United States Branch Mint for the year 1897 are now closed. The deposits of gold are the largest ever received. The total will slightly exceed $12,200,000, and a conservative estimate made by the mint officials places the entire output of Colorado at $22,000,000 in round figures.

At Leadville the Arkansas Valley smelter employs 550 men. The works are receiving 450 tons of ore daily from that camp, mostly from Breece Hill, the Ibex, Sedalia, Alzar and Resurrection being the heaviest contributors of lead-silver.

The Ingram at Salina continues to ship from fifteen to twenty tons daily.

The Tambourine made a shipment of good ore from Salina.

A strike of $400 ore is reported in the Last Chance at Delphi. The ore is in a 12-inch vein of sylvanite.

At Eldora the X Ray, Maude W., Delaware, Revenge, Gold Coin, Bonanza, Populist, Enterprise, Clara, Denver Group, Village Bell, Independent, Apex and Antietem are shipping ore.

News-Reporter: Iron is to-day the great product of Leadville. The much despised mineral of the early 80's that was thrown over dumps in the early history of lode mining in Lake county is now the salvation of Leadville. As a flux the iron produced from the mines of this district is unrivalled and finds its way to all smelters in the country where lead is used as the base of reducing ores. The high excess of metallic iron over silica makes it valuable as a flux in the reduction of refractory or dry ores, whilst the low percentage of phosphorus contained in the metallic iron makes it available for the manufacture of merchant bar and railroad iron in iron and steel furnaces.

The iron product of the Leadville mines finds its way wherever the value of the ores will bear the cost of transportion. Large shipments are made to the smelters of Durango in the extreme southern portion of this State, to Pueblo, to both the lead furnaces and the iron works at Bessemer.

The Globe and Grant smelters at Denver receive almost their entire supply from this locality, and the Illinois steel works find the iron and manganiferous ores of our mines far superior in the manufacture of Bessemer steel to the foreign product. In fact the only competitor we may have in the future in the Illinois and Ohio ore markets will be the Lake Superior iron mines which for years have held the monopoly of this trade on account of the superiority of their product which consists of an ore containing 66 per cent of metallic iron and only a trace of phosphorus. In the early days of mining in Lake county when the outcrops of the carbonate formation was first discovered and were as a rule high grade ores in an oxidized form, quality and not quantity was sought, as smelting was at that time in its infancy and high smelting charges prevailed, not that the smelters made exorbitant profits at the uniform charge of $25 per ton, as very often 25 per cent of the mineral contents of the ore went over the slag dump. As time progressed improved appliances were built in the smelters and a familiarity with the ores remedied the defects and smelting charges gradually decreased until at the present time ores that in 1879 and '80 were thrown over the dumps as worthless now return a good profit. It is safe to say that 75 per cent of the product of Leadville's mines now consists of the manganiferous ores and low grade carbonates that were considered worthless in the period referred to. While the values may not be so great as in former years, yet employment is given to a greater number of men and a greater proportion of the value of the product remains at home among our people. It costs just as much to break and hoist a ton of iron worth $6 or $7 as it does to mine and raise a ton of 200 ounces carbonate or sulphide ores, and as there is a great deal more of the former lying around the hills than there is of the latter, the miner working for day's pay, and the merchant depending for his trade on the miner's earnings, have no ground for complaint.

NEW MEXICO.

Fifty tons of iron ore per day is being shipped from the Santa Rita Copper and Iron Co.'s claims.

Davidson & Bell are sinking the shaft of the Golden Giant, near Bland, below the 450-foot level. They are taking out sufficient good ore from the 350 and 450 levels to keep the mill running.

Schriner, Hills, Rogers, Wilde, Sweet and

Jaccarn, of St. Louis and Kansas City, have organized the Rio Arriba Placer M. Co. for the operation of mines in Rio Arriba county.

At Pinos Altos, on the mines purchased by the Hearst Estate, D. B. Gillette proposes to conduct water thirteen miles to the mines and to install a complete electric plant. The improvements are being made at a cost of $100,000. Mr. Gillette is sending a carload of ore daily to the smelter.

Over 100 tons of ore per day is being shipped from the Confidence mine to the Co.'s mill at Whitewater; thirty stamps keep at work.

The ore body in the Copper Queen, Grant county, is from 5 to 12 feet wide, the values being equally divided, one-half gold and one-half silver. There are 1000 tons of ore on the dumps which will run from $40 to $50 per ton.

G. Young, near Silver City, is taking out ore which runs 18 per cent copper, $4 gold and six ounces silver.

Brockman & Hughes have a good body of 16 per cent copper ore on the Hanover, in Grant county.

The Mineral Point Zinc Co.'s claims shipped five cars dry bone (zinc carbonate) to the Co.'s works, at Mineral Point, Wisconsin, last week.

Biggs & Doyle struck a body of copper ore on one of their iron mines near Hanover last week.

The copper ore discovered in the Hanover mine, in Grant county, holds out both in extent and richness.

A force is employed in development on the Western Belle. The ore vein is 14 inches and assays from $40 to $70 gold per ton.

The Cochiti G. M. Co. has incorporated under the laws of New Jersey. Capital, 150,000 shares, par value $10. The incorporators and temporary board of directors are as follows: J. A. Coram, L. T. Trull, S. H. Stern, C. E. Rushmore, W. B. Crisp, H. S. Gans.

ARIZONA.

The gold property known as the Bonancita placers, situated near the Yaqui river just east of Guaymas, has been sold. The new company is officered by J. W. Garrett of the B. & O. R. R., Pres. G. Turnbull is Mgr. T. C. Cox has been appointed Supt.

The Crowned King, near Prescott, produces $186,250 per year, averaging $28 85 per ton. G. P. Harrington is Supt.

Near White Hills A. L. McKeown has 150 feet on a 26-foot vein. The ore averages $7 a ton.

On the Gladiator, near Prescott, there are six tunnels. The work runs steadily. A Falco is Mgr.

The Mammoth M. Co., in Pinal county, is making its shaft double compartment to the depth of 600 feet and enlarging its 50-stamp mill. Cyanide works will be erected to work the tailings, of which there are from 100,000 to 200,000 tons, estimated to contain from $9 to $13 per ton gold.

The Congress G. Co. at Congress Junction contemplates some new stamps, and after the two additional hoists are in perfect order the company will probably put in twenty new stamps. W. F. Staunton is Supt.

At the Vulture in Wickenburg they have fifteen men working on tailings, operating a cyanide plant. Results show $2 to $15 a ton on twenty to forty tons daily. H. Helm is Supt.

R. W. Baxter is working two men on the Trilby, in the White Picacho, twenty miles east of Wickenburg. A year's bond for this property was given for $25,000. The shaft is 80 feet on a 2-foot ledge assaying $200 in gold per ton.

There are said to be 150 prospectors doing work within a radius of twenty miles of Wickenburg. They have been working dry washers, but recent snows will enable them to improve on this method.

Clark & Hoyt have bonded mines near Pearce for $30,000. The bond contains stipulations assuring extensive development.

The Springfield M. Co., near Kirkland valley, has completed a 10-stamp mill. Sufficient ore is blocked out to keep the stamps falling for five years. The ore averages $60 per ton.

MEXICO.

The San Jose gold and copper mines, owned by the Nicholas Chemical Co., of New York, control 5000 acres of mineral land. Six mines are worked within this area. The smelting works are in successful operation, yielding between one and two tons of bullion per day, value $300 per ton in gold and copper. The production of the mines is at present limited to the capacity of the plant, about forty tons per day. Native labor is from 25 cents to 37½ cents per day. Coke costs $12 per ton at the smelter; freight on bullion to New York is $11 per ton from Tampico.

The Continjencia mine, near Nogales, is a gold, silver, and copper proposition, on which development work is in progress. The shaft is 82 feet; at this depth there is 13 feet of ore, an average assay yielding $8 gold, twenty to fifty ounces silver, and 20 per cent copper.

The San Miguelita, at Nogales, a gold and silver property owned by Reardon, Shay & Shutz, is fairly well developed, with a 10-stamp mill in active operation. The ore carries from an ounce to one ounce and a half in gold, and twenty ounces in silver to the ton. The shaft is down 400 feet; the ore body is from 3 to 6 feet in width. It is under bond to Gov. Thornton of N. M., and Gov. Grant of Colorado.

At the Esperanza and La Francisca M. Co. at Guacomea, Sonora, work is progressing, and a 20-stamp mill is in course of erection.

The Copper Queen Co. of Bisbee, is developing the Pillares at Nacosari. The depth is 300 feet, showing the ore body from 60 to 100 feet wide, bearing from six to nine per cent in copper. The ore body is nearly 1000 feet long, and extends within 50 feet of the surface to as far as development work has opened it. The camp is 102 miles from Bisbee, Ariz., on wagon road. A. Danforth is Supt.

Commercial Paragraphs.

THE Hercules Gas Engine Co. is supplying a 45-H. P. gasoline engine for a wire ropeway over Chilcoot Pass.

J. F. MERRILL, of San Francisco, has secured a contract from the San Francisco and San Joaquin Valley Railway Company for 8000 steel rails for $250,000.

THE Westinghouse Electric and Manufacturing Company has the contract for equipping the tramways and power houses at Glasgow, Scotland. These tramways are to be seventy miles in length. This concern has also received a contract for the street lighting plant of Malaga, Spain.

THE three furnaces of the Mountain Copper Company, Ltd., Keswick, Cal., will be supplemented by the addition of two more as rapidly as they can be put into place. The new furnaces are especially designed for smelting the fine ore, but can be used in the same manner as are the furnaces at present in operation. The powdered ore is the richest grade that comes from the mine, but the inconvenience of handling this product has been quite a drawback. To overcome this Parke & Lacy, 23 Fremont street, San Francisco, designed a roaster that is a success, and from this roaster the ore will be elevated to the smelters. The roaster has a capacity of 100 tons per day and the cost of putting the plant in place has been considerable. A half million brick were used in the construction of the oven exclusive of the flue, which when completed will be the most imposing stack at the works. The company is preparing quarters for large additions to the force. The increased capacity will necessitate the employment of probably 300 more men.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DECEMBER 21, 1897.

595,845.—CARPET STRETCHER — Ansley & May, Davenport, Wash.

595,757.—CHOPPING BOARD — J. B. Biles, Elma, Wash.

595,761.—BROOM—H. Brockmann, Santa Rosa, Cal.

595,935.—CIGAR BOX—C. A. Coey, Fairfield, Wash.

595,700.—VEHICLE WHEEL—J. T. Davis, S. F.

595,806.—ENVELOPE—S. M. Edwards, Los Angeles, Cal

595,875.—TENT—J. W. Ernest, Los Angeles, Cal.

595,715.—WAGON—G G. Kaiser, Johnson, Wash.

595,778 —SPRINKLER—E. A. Knoop, Monterey, Cal.

595,915.—FUSE CUTTER—E. A. Langford, Washington, Cal.

595,885 —STOP COCK LOCK—R. B. Mullen, Tacoma, Wash.

595,9 9.—WATER ENGINE—W. R. Phillips, Seattle, Wash.

595,788.—BENZINE APPARATUS—Small & Stillman, Sacramento, Cal.

595,793.—WATER PURIFIER—H. Stillman, Sacramento, Cal.

595,750.—INSECT EXTERMINATOR—C. Zimmerman, Santa Rosa, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FUSE CUTTING TOOLS.—Ernest A. Langford, Washington, Cal. No. 595,915. Dated Dec. 21, 1897.

This invention relates to a tool which is especially adapted to preparing fuse to be used in conjunction with mines and at other points where explosions are to be produced by such mines. It consists in the combination in a single structure of jaws movable to and from each other by means of handles and having openings respectively for severing the fuse into lengths, for crimping and securing it to the cap through which the explosion is eventually produced, and in cutting the end of the fuse to expose the powder core, so that it will be sure of ignition.

Colorado's Gold Fields. Illustrated.

Just out, with correct map and nearly 100 mining views natural as life. This valuable book will be sent free, prepaid, with our big 56-col. family paper 3 months on trial for 25c; club of 5 and 5 books $1. Latest mining news. Mention THE PRESS and address *Illustrated Weekly Sentinel*. Denver, Colo. Cripple Creek is fully described.

Recently Declared Mining Dividends.

Horn Silver M. Co., Utah, 5 cents per share; Dec. 31. This makes total dividends paid $5,150,000.

Whitewater mine, Kaslo, B. C., $30,000; Dec. 21; total, $124,000.

Ontario, Utah, 75 cents a share, $112,500; Jan. 1; total to date, $13,557,500.

Moon-Anchor G. M. Co., Colo, 2½ cents, $15,000; Jan. 1.

Boston & Colorado Smelting Co., a quarterly dividend of 1½%, a reduction from 2½%; payable Jan. 1. The company has for the past twenty-five years maintained a quarterly dividend of 2½% until the present quarter.

Chloride Point, Utah, $5000; Dec. 28.

Silver King, Utah, $37,500; Dec. 25; the thirty-sixth monthly dividend; total, $1,500,000.

Iowa M. Co., Colorado, ⅓ cent per share, $5000; Dec. 25.

Utah Con. M. Co., Utah, 1 cent per share, $1000; Dec. 29.

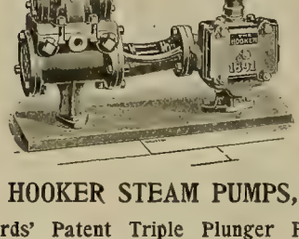
Recent California Mining Incorporations.

The Yukon & Northwestern D. & T. Co., San Francisco; capital stock $100,000, subscribed $3200; H. Zadig, A. J. McDowell, E. R. Bryant, J. J. McCarthy, R. F. Brodek, G. Haist, R. C. Reed.

The California G. M. Co., Stockton; capital stock $100,000, subscribed $5; R. B. Oullahan, W. C. Pyfer, K. C. Brueck, R. B. Tufy, H. E. Adams.

Trinity County M. Co., Oakland. Capital stock, $1,000,000; subscribed $50. R. M. Turner, W. W. Davis, G. A. Stevens, J. W. Laymance, D. Fite.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from B. Freecero, in the Frazer and Swank Gravel mine at Washington Ranch, Calaveras Co., to deposit tailings in an old pit; from Manuel Silva and Joseph Enos, in the Cherokee Flat mine at Cherokee, Butte Co., to deposit tailings on a flat below the mine; from J. Lagomasino, in the Grizzly Bear Placer mine near Johnsville, Plumas Co., to deposit tailings in Squirrel creek; from Paul Zerga et als., in the Last Chance Placer mine near Sierra City, Sierra Co., to deposit tailings on a flat below the mine; from T. T. Kirkham, in the Mt. Vernon mine near Nevada City, Nevada Co., to deposit tailings in Mt. Vernon ravine; from William Ross, in the Clark mine near Oleta, Amador Co., to deposit tailings in Deadman's creek; from Chas. E. Wise, in the White Oak mine near Colfax, Placer Co., to deposit tailings in Live Oak ravine; from John Solari and Joe Devenenzi, in the Red Gulch and Mahala Flat Hill mines near Volcano, Amador Co., to deposit tailings in a ravine below the mines; from J. F. and M. H. Goodman, in the Bicknell mine near Volcano, Amador Co., to deposit tailings in the North Branch of Sutter creek; and from S. R. Hackley, in the Indiana and Gold Bug mine near Omo Ranch, El Dorado Co., to deposit tailings in Perry's creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on January 17, 1898, at 1:30 p. m.



QUARTZ SCREENS
A specialty. Round, slot or burred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron, Zinc, Copper or Brass Screens for all purposes. CALIFORNIA PERFORATING SCREEN CO., 146 and 147 Beale St., S. F.

THE GREAT MINING FAIR
WILL OPEN
Saturday Evening, January 29, 1898,
AND CONTINUE FOR FIVE WEEKS,
AT THE MECHANICS' PAVILION, SAN FRANCISCO.

The Fair will contain practical exhibits and demonstrations of quartz, placer and all other methods of mining, and mining machinery. Complete working plans of the North Bloomfield mill will be in operation on a large scale.

In connection with the Fair there will be a complete Klondike outfitting exhibition, together with Klondike cooking lectures and practical demonstrations of packing supplies over the trails by horses, burros and men; also the methods of transporting these supplies across the lakes and down the Yukon river to Dawson.

For information, apply to the Secretary, No. 31 Post Street, San Francisco, Cal.

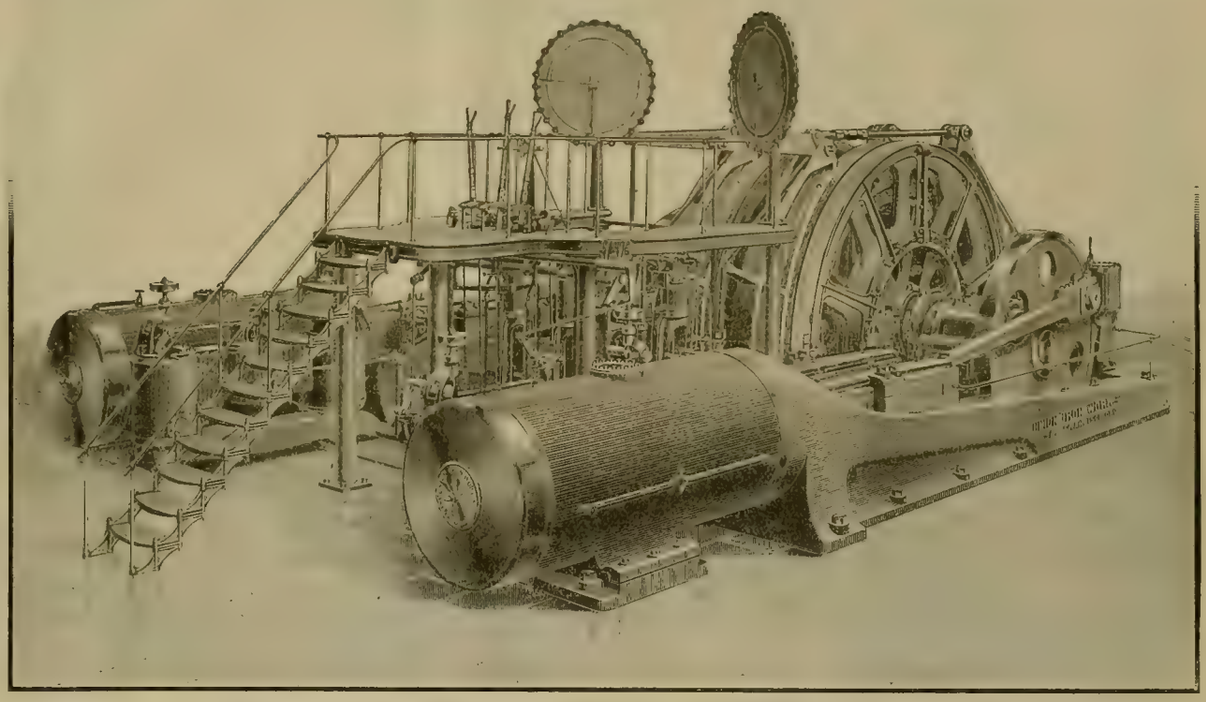
UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



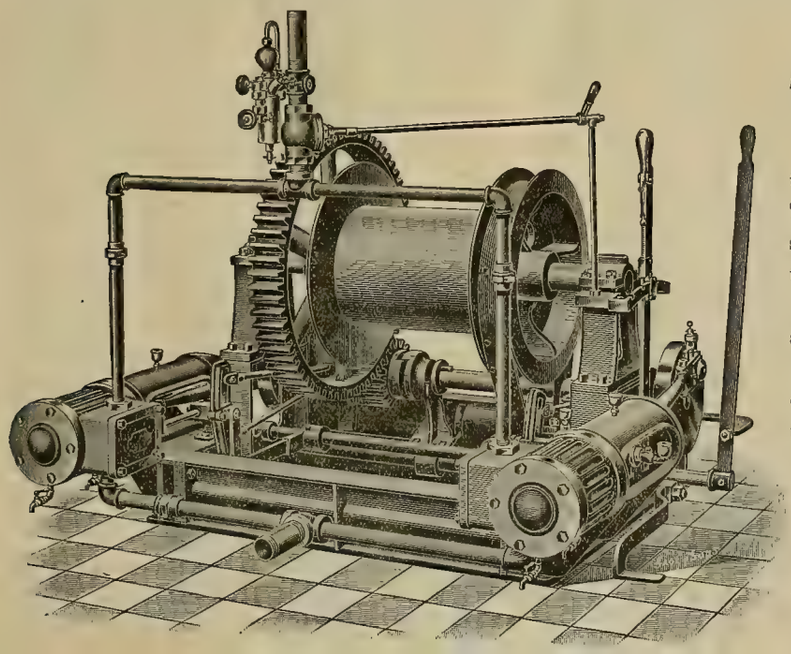
30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

BAKER & HAMILTON,

HIGH GRADE

Engines, Boilers,

ICE MACHINES, MINING TOOLS, Etc., Etc.

THIS CUT represents one of our improved **DOUBLE STEAM HOISTING ENGINES.** We have them in sizes from 12 H. P. up (with or without boilers). They are constructed with the greatest care by engineers familiar with the best previous practice. They come with sectional iron frames, reversible link motions, etc., consequently can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also have them with the Single Engines from 6 H. P. up; Boiler and Engine contained on same frame.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

WRITE FOR PRICES; THEY WILL INTEREST YOU.

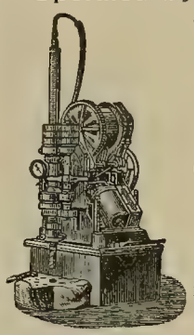
LEVIATHAN BELTING



WHICH FOR STRENGTH AND TRACTION POWER HAS NO EQUAL.

Especially Adapted for
MINING MACHINERY
AND
MAIN DRIVING BELTS.
It Is Unaffected by Water, Heat or Steam.
EVERY BELT GUARANTEED.
Write for Prices. Samples Free.

Main Belting Co.,
Factory at Philadelphia, Pa. 55-57 Market St., Chicago, Ill.

Diamond Prospecting Core Drills.
FIFTEEN SIZES AND STYLES.
Operated by Hand, Horse, Steam, Air or Electricity.

"CHAMPION."
1¼" Hole; 1 3/16" Core.
Depth, 1500 ft.

THE ONLY MACHINES GIVING ABSOLUTELY CORRECT RECORDS OF FORMATIONS PENETRATED.

SUPPLIED WITH SPECIAL EQUIPMENTS FOR PROSPECTING FOR . . .
Gold, Silver, Copper, Tin, Lead, Zinc, Iron, Coal, Salt, etc.

Full information given upon application.
M. C. BULLOCK M'F'G CO.,

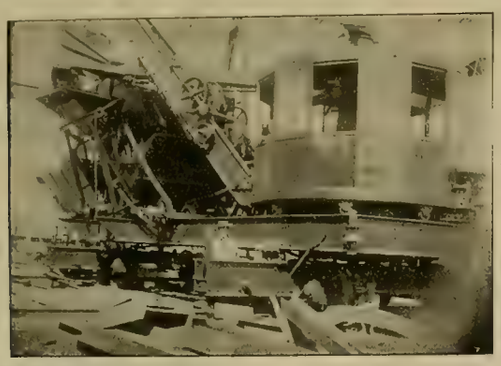
PLACER MINING

With Improved Electrical Shovel or Dredge and Amalgamator.

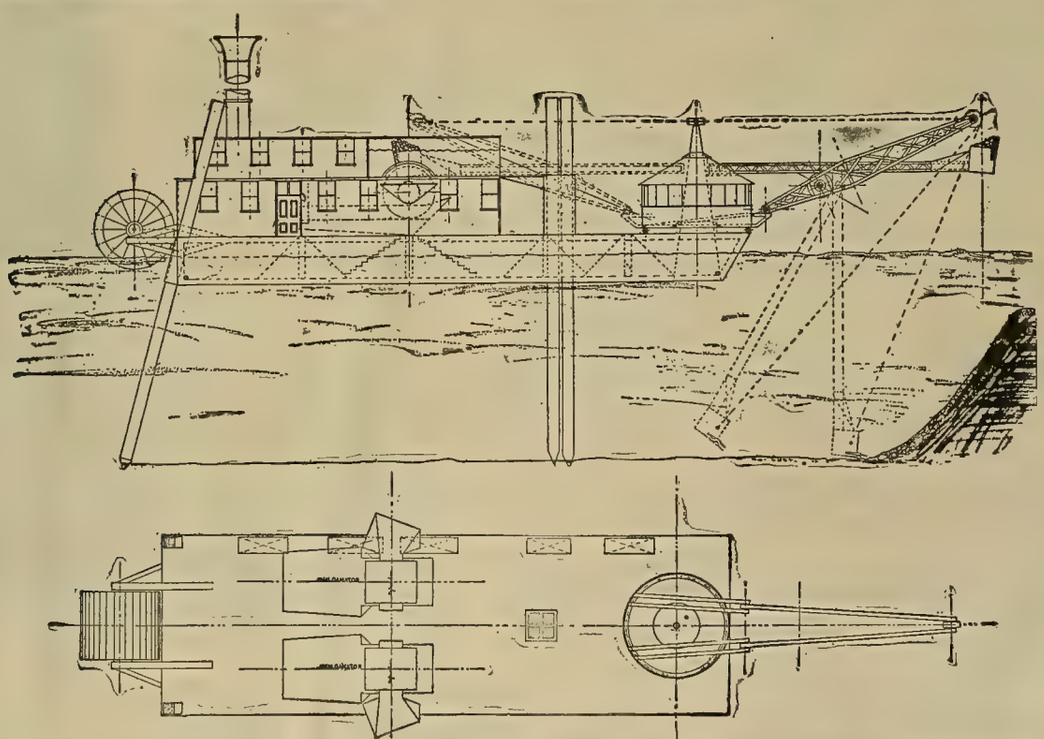
THE BENNETT AMALGAMATOR CO.

OF COLORADO.



CAPITAL STOCK, $10,000,000. 100,000 SHARES.
Full Paid, Non-Assessable. Par Value, $100.

THIS COMPANY having acquired the full and exclusive right under all the patents covering the Bennett Amalgamator system in and for Colorado, is the parent organization to which all other interests in the State are tributary, financially.



EXTENDED EXPERIMENTS having conclusively demonstrated that these plants do all that is claimed for them, the company desires to immediately commence their construction and operation.

A SMALL BLOCK of the stock of this company is now offered for sale for this purpose at the rate of $10 per share, or one-tenth of its par value. With the completion of one machine no more stock will be offered.

NOTE PARTICULARLY—When the machine has been manufactured and set at work, it immediately becomes a source of revenue to the company, as every day's work yields a good surplus of receipts over expenditures.

A SPECIAL ATTRACTION about the investment in this stock is, that no "dead work" is necessary to make a mine for the machine to work on, but it at once becomes a producer of values.

THE FULLEST INQUIRY AND INVESTIGATION INVITED. THIS STOCK, WHILE IN NO SENSE A GAMBLE, OFFERS POSSIBILITIES OF PROFIT FAR BEYOND ANY ORDINARY MINING INVESTMENT, REAL ESTATE OR MANUFACTURING ENTERPRISE.

EVEN IF YOU ARE HEADED FOR KLONDIKE, we can show you how you can utilize this machine to lessen the risk and hardship of the trip and materially enhance the profit of the venture. In knock-down shape it is portable, and can be transported over any wagon road. For further particulars and illustrated circulars.

Conducted on both the European and American plan. This favorite Hotel, located in the best and most central portion of the city (being in the same block as the Mills Building and immediately adjoining both the Telephone Building and the First National Bank), is under the experienced management of Chas. Montgomery, and is as good, if not the best Family and Business Men's Hotel in San Francisco. Electric return call bells in rooms.

Board and Room per day, $1.00 to $2.00. Board and Room per week, $6.00 to $12.00. Single Rooms, 50 cts to $1.00. Family Rooms, $1.00 to $1.50.

Free Coach to and from the Hotel.

Assaying Gold
.....AND.....
Silver Ores.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores.") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

DENVER, COLO.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Skeleton Mining Report.
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts

Stamp Milling of Gold Ores.
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman o practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

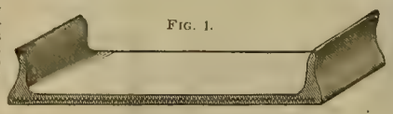

FIG. 1.

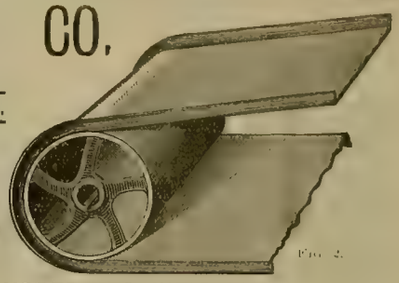

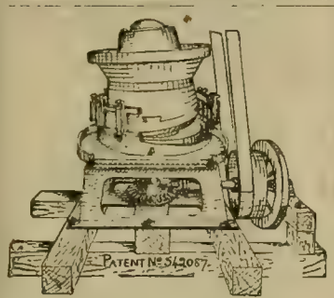

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 30, 1897.

Considering that this is the closing week of the year, general business is good. From all that can be learned preparations are being made by jobbers and manufacturers for a very large increase in their business the coming spring and summer, due to a large rush of people to Alaska. The number of persons that will go there next year is placed at from 100,000 to 200,000. The railroads and other transportation companies in this country are doing all they can to help it along, as are the transatlantic steamship companies, for the craze in Europe is as bad as it is here. It is given out by reputable mining men that the tributaries of the Mackenzie river that drain the east side of the mountains are as rich in gold as any found on this side. If this shall be proven correct by prospectors going there, then the year 1898 will witness another rush to that section. The Alaska boom will cause more attention to be given gold mining properties in California and neighboring States.

The local money market is quiet and easy. The impression prevails that there will not be much change in the situation until towards the close of January, when a speculative investment demand is expected to set in. It is estimated that the disbursements in this city next month will aggregate more than in the corresponding month of 1897; the amount is placed at over $6,000,000. This will help quite materially in meeting any demand that may spring up. The disbursements at the East, particularly at New York, will be larger than ever before. It is worthy of mention that large sums of money from this country have sought investment abroad, owing to the rate of interest there being better than in the United States. This condition shows that we have grown to be a large money lender, and in the course of time, probably before five years, we will control the finances of the world. The East reports that a fairly firm market ruled up to this week; when it became easier, owing to the United States disbursing money. The disbursement to be made in New York next month is placed by the *Wall Street Journal* at over $100,000,000, which will cause an easy money market there and bring about more speculation.

New York Silver Prices.

NEW YORK, Dec. 30. — Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	26⅜	57⅝
Saturday		
Monday	26¾	57½
Tuesday	26⅝	57
Wednesday	26½	56¾
Thursday	26⅝	57⅛

London Merchants	$4.81½
London Sight Bankers	$4.85½
Refined Silver, per oz., 1000 fine	57⅜
Mexican Dollars nominal	47@—

SILVER.—The market fluctuated to slightly lower prices but to-day it rallied some, closing firm at New York and London. The market is very sensitive to any demand and this being the case still firmer prices ought to rule, for there will be an improved demand from India and Argentina for crop moving purposes. The Central American States ought to take more for coffee harvesting purposes. A late cable from London states that the Indian money markets were firm and considerable money will go forward to that country. The last steamer for China took out $36,070 in silver bullion for Hongkong and $70,000 for Bombay.

MEXICAN DOLLARS.—The market is fairly firm. The last steamer for Hongkong took out $241,006 in Mexican dollars.

COPPER.—The market has held to fairly steady figures. The continued strike in England is being felt in the market value of copper. New York advices state that the export demand is light, as is the home consumption, which tends to create an easy market.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12¼@—
Sheet copper	—@16½
Bolt ¼ and 5-16, 20c; ⅜ and larger, 16½	

TIN.—The market is quiet for both plate and pig. The East reports quiet markets with some cutting.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—The market is steady.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—The market is firm at current quotations.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

QUICKSILVER.—The market is quiet but steady. The last steamer for Mexico did not take out any. The East reports firm markets.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market is quiet but fairly steady. Reports come through of large sales in the central West, but they did not affect values.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75 @ 5 00
Sheet	6 30 @ 6 80
Pipe	5 60 @ 6 10

IRON.—The market is quiet. Imports of foreign the past week aggregated nearly 200 tons. The East reports free offerings of Southern, which cause an easy market there.

NAILS.—The market is firm.

We quote the following basis: 20d to 60d, inclusive—wire $2.60, cut $2.50.

COAL.—The market is practically unchanged. The cold weather causes a heavy consumption.

Receipts of Coal for the week ending Tuesday were as follows in tons. Puget Sound, 8949; Japan, 2700; Nanaimo, 2139; Newcastle, N. S. W., 3500; Coos Bay, 1375; Hull, 1738; Comox, 6550; Swansea, 2887. Total, 29,633.

COKE.—The market is quiet. Imports were quite free the past week, as follows in tons: London, 504; Shields, 373; Hull, 532; Newcastle, England, 1721; Dundee, 2700. Total, 5830.

The market is quoted as follows:

Gas Companies'	— @ —
English, to load	— @ —
" spot, in bulk	11 00 @ —
" in sacks	12 00 @ —
Cumberland	10 00 @ —

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is firm with a good demand ruling.

The market is quoted as follows:

Refined, in carload lots, in barrels	6
Refined, in carload lots in sacks	5¾
Powdered, in car lots	5¼
Concentrated, "	5½

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

Chemicals.

The market is quiet but fairly firm. It is expected that better prices will rule soon for some kinds. New York reports Nitrate of Soda firmer owing to a better concentration; outside of this the market was unchanged.

CYANIDE OF POTASSIUM.—The market is steady.

Our market is quoted for chemical pure 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1¾c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6¾@7c per pound in carboys.

BONEASH.—There is a slow demand.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady, with better inquiry.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firmer.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steadier at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA. — The market is quiet, with a steadier tone.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Dec. 30, 1897.

The market has been very dull throughout the week, with sales of only 300 shares recorded at one of the regular calls. This is accepted as direct evidence that the public is not doing anything and that the manipulator is willing to let the market drift along for the present at least. Although the market has been inactive, prices have stiffened slightly. This, in the natural order of things, they should, for many are selling very considerably below assessments paid this year. From all we can learn, the mill owners on the Comstock, and also the owners of the railroad and other enterprises in that district, have tired of the small output of ore, as the properties owned do not pay, and will insist on the mines being more energetically worked for the purpose of discovering one or more large bodies of ore. If this information is correct—and it has every semblance of being so—then we can reasonably look forward to more active exploiting than for several years, and as the history of Comstock mining shows that a strike of a large body of ore has been made when least expected, it is quite safe to affirm that history is more than liable to repeat itself under energetic exploiting. To do this will require increased expenditures of money, calling for assessments; but shareholders pay these cheerfully when there is a chance of striking ore. It is not at all unreasonable to assert that while work is under way the mining share market will be subjected to many ups and downs. It will also be spotted—that is, one or more shares move up and then ease off, while one or two others move up. This will invite more active trading and allow the nimble trader to make a little by getting out on ups and in on downs. This has been the case when more active work is under way in the Comstock mines, and it will be again, but it is to be hoped that it will not end, as it has for several years, in a complete fizzle. At present prices the market is a gamble.

In the Bodie district the outlook is promising for more activity next year, with an increase in the bullion output looked for.

The news from the Comstock mines is confined almost entirely to official letters, and as usual some of them are unsatisfactory to outsiders who are not miners. The west crosscrift in Utah was at last advices in soft porphyry showing clay seams. In Sierra Nevada they are making good progress in the Riley tunnel. They average about 8 feet a day. The east crossdrift on the Layton tunnel level passed through low-grade quartz. Fair progress is being made in west crossdrift No. 5 on the 900-foot level of the Union shaft workings. Work in Union is confined to east crossdrift from the south drift above the 900-foot level. The east crossdrift on the 1000-foot level in Mexican is in more favorable formation. It is in over 550 feet. If they keep on the west crossdrift in Ophir on the 1000-foot level will reach the gold-bearing lode to the west. They are in about 725 feet. At last advices the face was in seams of clay and vein matter. On the Central tunnel level they have struck 50-cent ore, which will lead to a 25-cent assessment down here. The work in Con. Virginia is continued on the 1550-foot, 1650-foot and 1750-foot levels. Nothing of special interest is reported in the official letter. They are still drifting north in Andes on the 175-foot level. Nothing of special interest comes to hand from Best & Belcher and Gould & Curry. The Kinkead milling plant has suspended work owing to labor troubles. This stops the milling of ore from the latter mine, also prospective working of dumps of Ophir and other mines. They are making fair progress in the west crossdrift of the 500-foot level of Savage. They are also preparing for active work on the 130-foot level. In Chollar they ought to be through soon with repair work. In Potosi the work is the same as reported last week. They are repairing and retimbering the Crœsus shaft in Bullion. This is west and in years gone by proved quite rich. They still continue timekilling in Alpha on the 500-foot level. There is still a strong flow of water in the Challenge-Con. Imperial-Confidence west crossdrift. It is in nearly 1700 feet. The Con. Imperial surface tunnel is in about 500 feet. It is in old fillings. From Yellow Jacket nothing more is at hand than was reported last week. According to official letters the work in both Crown Point and Belcher is being pushed with more energy. It is largely of an exploiting character and in the direction to find the extent and value of the ore found some time ago. In Overman they are repairing and enlarging the main incline. Some ore is being raised from the 900-foot level. The news from Justice is quite encouraging. The management believe that the work is proving to be a valuable proposition. The work is of an exploiting development character.

Renewed interest is being centered on the Brunswick lode. The work to the west in the Best & Belcher and Gould & Curry, run jointly by these two, is causing the shares to exhibit more strength. They are still drifting north on the 600-foot level of Savage. In Chollar work is confined to the 300-foot, 500-foot and 600-foot levels. Nothing new is reported. In Potosi work is continued jointly with Chollar to the west on the 500-foot level, and in an upraise on the 600-foot level. From Occidental our advices report active exploiting work, but with no particular change to note on the 550-foot, 650-foot and 750-foot levels.

Assessment Notices.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 29th day of November, 1897, an assessment (No. 2) of Five Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 125 Beale street, city and county of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1898, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 29th day of January, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. H. MARTIN, Secretary.

Office—125 Beale street, city and county of San Francisco, California.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Gold Hill Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3d day of December, 1897, an assessment (No. 58) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of January, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 28th day of January, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of December, 1897, an assessment (No. 29) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of January, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary

Office—Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Pacific Placer Machine.

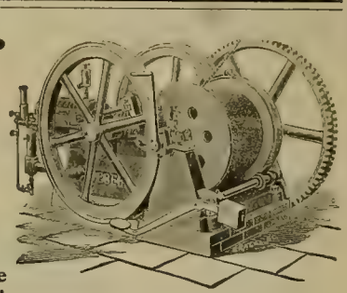
Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our larger Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb, 400 lb, 550 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

Lunkenheimer's "Crown" and "Sentinel"
Sight Feed Glass Oil Cups.

"CROWN"

Are unequaled for stationary bearings and dynamos. Their construction is simple and practical, and they excel in feed and regulation. Central stem is in one piece, a feature which no other make has. These Cups are devoid of clap-trap mechanism. A trial will prove their superior advantages. Made in 8 sizes, holding from ½ to 18 ounces of oil.



We are also sole makers of the "Pioneer," "Royal," "Miami," "Ajax," "Rival," "Ruby," "Yankee," etc., and a full line of grease cups. Specify "Lunkenheimer's" and get the best. Supplied by dealers everywhere. Catalogue free for the asking.

"SENTINEL."

Weber
GASOLINE HOISTING ENGINE.
MONEY SAVERS.
Costs to run One Cent per Horse Power per Hour. No Coal or Wood and very little water required.

This cut represents our 10, 15, 20, 30, 40, 50 H. P. Geared Hoist.

Saves $12.00 Per Day.

CHAPAREL, ARIZ., June 7, 1897.

WEBER GAS & GASOLINE ENGINE CO., KANSAS CITY, MO.—GENTLEMEN: The 10 H. P. "Weber" Geared Hoist you sent us has been in constant use since May 23rd, and is doing everything guaranteed by you with perfect satisfaction. Besides hoisting the ore and waste from the shaft with three 8-hour shifts sinking, it is kept very busy hoisting water, and has never been cooled off since we put it up and started it going. We were then 53 feet deep and we are now 108 feet. It will consume about ten gallons every twenty-four hours of 65 deg. gasoline, but I think when we can procure the 74 deg. gasoline, the consumption of fuel will be less. The engine was put up, started and has been run without our ever having seen a gasoline engine in operation before. Neither of the parties now running the hoist had ever had any experience with gasoline, and neither are professional mechanics. The engine hoists the loaded bucket with two men on top with apparent ease, starting loaded as easy as any engine can possibly do. I consider the hoist a complete success, and should I again have use for another engine, this would be my choice. Respectfully yours, GOPHER GOLD MINING COMPANY. Per H. B. Hanna.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

Sole Licensee for the Manufacture and Sale of the

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal; (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

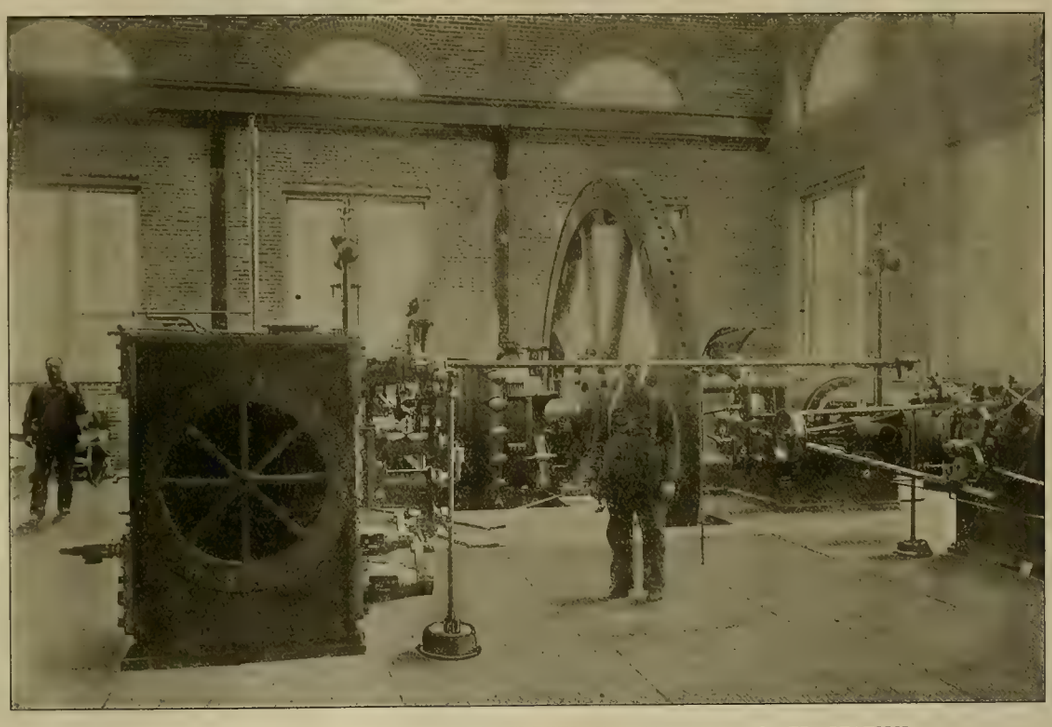
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 1957.—VOLUME LXXVI. Number 2. SAN FRANCISCO, SATURDAY, JANUARY 8, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.



Suburban Railway Power Plant.

Throughout the entire extent of the Pacific coast the details of successful working of city and suburban railway power plants are of interest. Herewith is illustrated the engine room of an electric railway power station of a suburban service that is probably unequaled in the world. The regular running rate on this road—the Lorain & Cleveland, Ohio—is fifty miles an hour. The road is built along the lake shore, through a level country.

The power house is located midway between Lorain and Cleveland, on the bank of the lake. The intake is placed 1200 feet out in the lake and the supply is brought to a cold well adjacent.

Two batteries of boilers are installed, aggregating 300 H. P., and a space is left for adding 900 H. P. when the service requires it.

The illustration was taken soon after the road began operating and before the installation of machinery was complete. It shows the two cross-compound Corliss engines. The necessary gauges, the hand wheels that control the main steam valves and other fittings were not then in place. The cylinders are 20x36x48 inches and speed eighty revolutions per minute. The flywheels are 20 feet in diameter and weigh thirty tons each. The steam piping is carried under the floor, iron plate fittings being put in for accessibility between cylinders. This does away with what is often a great inconvenience in the use of traveling cranes, and improves the appearance. It is rendered possible by the location of the boilers 22 feet below.

ENGINE ROOM OF THE LORAIN & CLEVELAND RAILWAY POWER STATION.

The engines are provided with double eccentrics on the high and low pressure cylinders. Each has two governors. One operates the release valve and the other cuts off the steam, when the speed of the engine increases 10 or 12 per cent by releasing a weight which operates a butterfly valve in the steam pipe, and which also throws a circuit breaker in the main generator circuit.

Each of the engines is directly connected to a 400 K.W. generator, wound for 630 volts at no load and 700 volts at full load. The switchboard is located in the side of the building in the background, considerably to the left.

Beside the present engine plant is a reserved space for the installation of more engines when they are needed. The present plant is capable of carrying an overload of 10 per cent in excess of the rated capacity. The steam piping is arranged so that the engines may be run either condensing or non-condensing, with either or both cylinders taking steam direct, the steam supplying the low pressure cylinder passing through a reducing valve.

An Important Ruling.

The Secretary of the Interior has reversed a ruling of the Helena, Montana, land office in a case of some general interest.

In February, 1896, H. Elling applied for a patent to his mining claim. During the period of publication the Lillian Mining Company filed a protest against the issuance of a patent. Subsequently defendant made a motion to the Helena land office to dismiss the adverse. The land office declined, on the ground that the adverse, having been filed, could not be dismissed until the question of the ownership of the ground had been settled in the court, in accordance with the custom always followed in such cases. Elling appealed from this ruling to the Commissioner of the General Land Office, but the latter affirmed the decision of the Helena office.

Appeal was then had to Secretary Bliss, and his decision reverses both lower decisions. His ruling is viewed as a reversal also of previous department rulings in such cases. He says: "The department has heretofore held that a co-owner objecting to the issue of a patent must protect his rights under the form of procedure provided for an adverse claimant; but it is now insisted that this rule of the department has been reversed by the Supreme Court in Turner vs. Sawyer. This was an action brought by Sawyer, a co-owner, against Turner et al. to have Turner declared a trustee of Sawyer of an interest in the Wallace lode, which had been patented to Turner. The interest of Sawyer grew out of proceedings somewhat similar to those in the case at bar so far as action was had under section 2324."

In concluding the opinion the Secretary says:

"It is clearly apparent that the court has here announced a doctrine that is the reverse of that heretofore held by the department. The ruling of the court is binding upon and must become the ruling of the department. It follows, therefore, that the protest in question is not such a one as can be recognized as an adverse claim necessitating the institution of proceedings thereon, in a court of competent jurisdiction. It is the duty of the land department, excepting in controversies referred to the court by the statute, to determine before the issue of a patent whether the applicant is entitled thereto, and the fact that such controversies may be litigated in the courts after the issuance of patent does not relieve the department of its duty in the premises. Where the matter has already been decided by a court of competent jurisdiction, the question may arise whether such a decision is conclusive upon the department, but without deciding the question, it seems clear that where the dispute does not involve the character of the land, or the qualifications of the entry man, or his compliance with the law under which title is sought, the department may properly accept and follow the judgment of a court of competent jurisdiction determining as between contending parties their respective rights and interests in the land in controversy. The department is not required to await the bringing of suit, because it is not so provided in the statute and because there is no obligation upon either party to invoke the jurisdiction of a court, as there is in the instance of an adverse claim. Here suit has been instituted in the local court for the purpose of settling the question of joint ownership. Jurisdiction of the subject matter may exist even though not recognized by Sections 2325 and 2326. The land department may, therefore, well await the result of that suit before giving consideration to the protest."

THE great increase in the production of aluminum in this country by a cheaper process and the consequent reduction in price resulted in '97 in the receipt of orders by the principal manufacturers for large amounts from foreign nations for equipment of their armies, the contracts aggregating fifty tons a month.

THERE will be two great "rushes" in '98, that of individual adventurers to the Klondike and of European nations to partition China. Both will be of industrial benefit to this coast.

WELLS, FARGO & Co. compute the gold production of Utah for 1897 at $1,609,340.

NEW YORK CITY lead quotations in March, '77, were 6.75 cents per pound; in August, '96, 2.65.

THE Spokane, Wash., stock exchange has petitioned for privilege to disincorporate because of lack of business.

THE 1850 product of the New Almaden, Cal., quicksilver mines was 7723 flasks of 76½ lbs. each, the 1865 product was 47,194 flasks. To Jan. 1st, '97, the mine has a record of production of 957,221 flasks. To that date California quicksilver mines produced an aggregate of 1,743,785 flasks.

THE transfer of the Zantgraf mine in El Dorado Co., Cal., by E. W. and T. B. Chapman to Col. J. L. and D. H. Cole is among the transactions of the last few days in mining deals. Possession was given on the 3d inst. The price is $200,000 cash. The clean-up for December at the Zantgraf mine was $20,000.

BY an unfortunate omission purchasers of the issue of the 25th ult. at the news stands were not supplied with the map which went with that edition. Additional copies have been provided, and those who were not supplied can secure one from the newsdealer who furnished them the issue of Dec. 25th.

WITH '98 comes news of interest to southeastern California and southwestern Nevada that the California & Eastern road is to be extended from Manvel to Good Springs—a distance of forty-five miles. The extension will traverse a country rich in low-grade ore that can be profitably handled only by cheaper transportation.

THE Mountain Copper Mining Co., Keswick, Cal., which recently bought the New Jersey Metal Refining Works, Elizabeth, N. J., is now credited with a production of 750,000 pounds per month. It is estimated that there exist 1,000,000 tons of ore, carrying 75% copper, and, to the ton, three ounces silver and 85 cents gold.

A PARTY of eighty-five miners from the Klondike this week say when they left there was no danger of starvation there, because of the wholesale exodus from Dawson down the Yukon to Fort Yukon, where provisions were more abundant. Nothing has been heard this year from Secretary of War Alger, or his ice locomotives or reindeer.

IT is in order to state as a matter of authentic record that the date of the discovery of gold by Marshall was Jan. 19th, and not Jan. 24th, 1848. The latter date has been extensively announced, but the fact as herein stated is absolutely correct. The fiftieth anniversary of the discovery of gold in California by J. W. Marshall will be Jan. 19th, 1898. It is a matter of little consequence in one sense whether it was the 19th or the 24th and the Golden Jubilee parade can, with great propriety, be held on that latter date, but to be chronologically exact it is to be borne in mind that the event which was the most important thing that occurred in the lives of a million men and all connected with them or their descendants occurred Jan. 19th, 1848.

'97 WITNESSED considerable advance in California electrical enterprises; and if the latest proposed extension to the circuit of the San Joaquin Electric Company's service goes into practical effect, that California concern will have what is probably the longest distance transmission and the highest electric pressure in the world. It is locally reported that a contract has been signed to extend the present circuit (which runs from the power-house on the north fork of the San Joaquin river to Fresno) to Hanford, thirty-two miles farther, a total distance of sixty-seven miles. The potential at the power-house is to be increased from 11,300 volts to 19,450 volts. It is understood that the extension is to be completed from Fresno through Selma and Fowler by April 10th, '98.

THE announcement that the issue of this paper of the 29th inst. would be a golden jubilee edition has elicited considerable inquiry as to the proposed scope and character of that number. In general, it will be historical and reminiscent, dealing with facts in the early history of gold discovery in this State, the idea being that it shall be a standard authority for reference during the next fifty years regarding authentic statement of fact. It will contain fifty-two pages. Those who are not regular subscribers should order in advance from their nearest newsdealers, as the pages will not be stereotyped, and after publication the matter will be distributed. The issue, it is believed, will be interesting to every resident of California, or to anyone who ever heard of the Golden State.

BUTTE, MONTANA, PAPERS say that there are 2000 idle miners in that place. This is not due to any decrease in force, but owing to the good wages paid there. Idle men from all over seek Butte, where there is little hope of securing employment, as the mines are showing a preference for the older and more experienced miners. The *Miner* looks for great relief in that region in the spring, when there will be "a great exodus to Alaska—far greater than one who has not been studying the situation would imagine. Strange to say, in most instances it is the experienced miner who is figuring on going to Klondike. The love of adventure never dies in the real miner; and there are hundreds of men, probably a thousand in Butte, who will give up positions paying good wages to chance the frigid zone."

IN the famous Tyler–Last Chance litigation Judge Beatty last week rendered a decision adverse to the Tyler Co. In his summing up the judge, as have other jurists before him, on the question of extra lateral rights, referred to the absurdity of the law, and said: "The statute gives the right to follow 'ledges throughout their entire depth,' which is the most valuable right under the mining law granted to the miner, and one which a court would not attempt to wrest from him. When it is held that this right is to be exercised by following between the planes of those lines which the ledge crosses, it should result that it may be following indefinitely in such direction. It is true that under such a rule it may sometimes occur that a party would follow nearly the course of his ledge, which seems rather absurd, but if the law cannot be so construed that a ledge must be followed on its true dip, but only as stated, we must accept the absurdity. It is now held that the defendant may follow its ledge westward of its end line."

IN connection with the Golden Jubilee Mining Fair, which will be a center of attraction to Californians and the coast generally throughout February and part of March, it is well to bear in mind that there will be a great Transmississippi exposition held at Omaha, Nebraska, next summer, and that the west half of America proposes to well represent there its mineral resources; that other States are preparing State mineral exhibits, and that it is in order to have California properly represented therein. It is not likely that the State will appropriate any money for that purpose, though other States have; but it is none too soon to suggest that much of that which will be exhibited during the six weeks beginning January 29th at the Mechanics' Pavilion in San Francisco could with great propriety be transferred to Omaha next summer. This is a matter that every man who possesses a mine of gold, silver, lead, antimony, iron, quicksilver, or any other useful metal in this State, is personally interested in, and it is none too soon to give the matter personal attention.

THE Golden Cache fiasco is an unfortunate affair for British Columbia. So much had been said about the riches of that mine, and so much money had been spent on it, that it is a keen disappointment to all concerned to know that in the recent clean-up 745 tons went $3.10 per ton, which, under British Columbia mining conditions, foreshadow for it the probable reorganization of the property. The stock, which was quoted at $1.85, has suffered considerable depreciation; and some men who have put their money into it are out several hundred thousand dollars.

THE recent Mariposa county correspondence in these columns, showing the good returns from the Merced Gold Mining Company, must be a great satisfaction to Boston people; for this paper is assured on credible authority that in case final success crowned the efforts of that company, many millions of Boston capital would be poured into California. This gratifying fact is somewhat shaded by the unkind insinuation from the Hub, that some of those connected with the company in question are not wholly satisfied at the publicity given the recent clean-up. Indeed, intimation has been made rather broadly concerning a plan of freezing out certain stockholders said to have been contemplated. Of course, when the stockholders know what splendid returns have been realized, they will naturally inquire as to the necessity for any assessment or borrowing of money, and such alleged scheme thus frustrated.

IN last week's issue was briefly noticed a London statement that the British-American Corporation, a London concern capitalized for £1,500,000, had bought some British Columbia mines, and incidentally the business of the Alaska Commercial Co. of this city, which Leon Sloss of that company in the same issue denied, saying that they had had an offer, but that there was no sale. In the London financial papers to hand appear page advertisements of the scheme, in which it is distinctly stated that they have guaranteed £500,000 of the capital and have secured options on the properties they describe. Among the properties so described are the Le Roi mine, the Josie, the Nelson-Poorman, and half a dozen others, the assets and good-will of the Alaska Commmercial Company, the stores of the company in Alaska, their property, including claims in the Klondike district, etc. They made the second payment of $35,000 to the officers of the Josie Mining Co. at Rossland, B. C., on the 31st ult.

DURING '97 the total gold coinage at the San Francisco mint aggregated $33,522,500, of which $29,405,000 was in 20-dollar pieces, $2,347,500 in eagles and $1,770,000 in half eagles. The total silver coinage for the same period was $6,561,791.65. No authentic figures have yet been received regarding the gold output of California for '97. For a variety of reasons accurate returns should be made, that correct statement may be made. Some mining companies do not realize the importance of this matter. As a case in point is mentioned a paragraph in a letter from one of our county correspondents this week, in which, speaking of the gold yield of his county, he says, "I fear that when the figures for the gold output of this county for '97 are made up we may get the worst of it, as the —— Mining Co. (mentioning the biggest gold producing property in the county) have sent their bullion outside, apparently for the purpose of leaving no trail as to their real output." While, of course, every one has a right to do as he likes with his own, yet, such action as that indicated is too common in California, and without being of any corresponding benefit individually, does the State an injury. It is to the interest of the com-

monwealth of California that every dollar's worth of gold annually produced within its borders be known and properly credited.

ACCORDING to a Washington dispatch, the Director of the Mint has substantial evidence that the world's product of gold for the calendar year of 1897 will approximate, if not exceed, $240,000,000, an increase of nearly 20 per cent over 1896. The gold product of the United States for 1896 was $53,100,000; for 1897 it will approximate $61,500,000. The product of Africa for 1896 was $44,400,000; returns received up to December 1, 1897, indicate that the gold product of that country for the year will be $58,000,000. Australia, for 1896, $45,200,000; for 1897 the indications are that it will be $51,000,000. Mexico, for 1896, $8,330,000; for 1897, estimated at $10,000,000. The Dominion of Canada, for 1896, $2,800,000; estimated for 1897, $7,500,000. India's product for 1897 is estimated at $1,500,000. Russia's gold product for 1896 was $21,550,000; for 1897, estimated to approximate $25,000,000. With the exception of the South Appalachian range, the Director believes that statistics will show an increase of every producing State in the gold product over that of 1896.

J. B. REINSTEIN, J. H. Budd and W. C. Jones, the trustees appointed by Mrs. Phœbe Hearst for the obtainment of an architectural plan of the buildings and grounds for the University of California, have completed their programme for an international competition, open to the architects of the world, a copy of which has been received. Copies of the programme for distribution will be forwarded to the capitals of all foreign countries and to the principal cities of the United States. The competition will close on July 1, '98, when all plans must be deposited with the United States Consul at Antwerp, Belgium. A total sum of at least $20,000 will be devoted to premiums for the best plans. The sum of $50,000 has been deposited in a San Francisco bank as a guarantee that the trustees will keep all their promised agreements. The programme gives full details of the competition, with rules, places of deposit, of plans, etc. The competition is open to the world and closes July 1st, '98. As heretofore noted at length, the regents have been enabled through the munificence of recent gifts to enter upon the work of erecting several groups of buildings that in construction, extent and appearance shall be commensurate with the fine site of the University.

THE sale of the steamers Pennsylvania, Ohio, Indiana, Illinois and Conemaugh by the International Navigation Company to the States Steamship Company for the Pacific trade leaves five steamships flying the American flag crossing the Atlantic ocean. They are the St. Paul, gross tons, 11,629.21; St. Louis, gross tons, 11,629.21; New York, gross tons, 10,802.61; Paris, gross tons, 10,794.86; Evelyn, gross tons, 1963.44. The latter three were built in English shipyards and denationalized. The last annual report of Commissioner of Navigation Chamberlain states that 6599 steam vessels, of 2,358,577.59 tons gross register, were afloat flying the American flag, and that 3776 of them, with a gross registered tonnage of 1,206,247.41 were owned on the Atlantic and Pacific coasts, the balance being owned on the Northern lakes and Western rivers. Such figures are misleading. As a matter of fact there are only 186 seagoing steamships, over 1000 tons gross register, amounting to 478,300.38 tons, flying the American flag. The Hamburg-American line and North German Lloyds of Germany alone own 552,558.00 gross tons, or 74,258.00 tons more than all American companies put together. Following is a summary of the class of vessels mentioned flying the American flag:

	No.	*Gross tons.*
Steamers from Atlantic ports to foreign ports..	38	124,876 31
Steamers from Pacific ports to foreign ports....	22	59,708.81
Steamers from Atlantic ports coastwise.....	98	235,239.42
Steamers from Pacific ports coastwise.....	28	58,475.84
Grand total.....	186	478,300.38

SOME notice was given last week of the "Great Northern Industrial Gold Company, Limited." It is unfortunate for California, so far as British investments are concerned, that such companies are formed and such prospectuses issued. The prospectus of a mine, whether in California or elsewhere, when prepared in London, is a delightful romance, and this particular one is no exception. It is appearing as a page advertisement in every English newspaper that is feared, and its glittering statements will doubtless have weight with a certain class. The two local gentlemen mentioned in connection with it are said to know nothing about it. The property, which is in Plumas county, this State, has been pretty well developed and is of some value, consisting of eleven claims well known locally—being the Ohio Point, Dude, Brooks, Buyers, Joe, Hallsted, Rich Gulch, Scheiser Ravine, Patton, Lewis and Summit quartz mines. A little of what is so, mixed with a great deal of what is not so, not specifically stated, but cleverly intimated, makes this one of the most seductive schemes put on the London market for some years. It is unfortunate for California that British promoters and brokers make such attempts as the one herein noticed. It is bad for this State, inasmuch as it tends to give a black eye to legitimate and worthy propositions. A great deal has been editorially said in these columns recently regarding British investments in California mines, much of which applies to this particular latest case. The worst feature of the whole thing is, that when this scheme fails—as fail of course it will—the odium will be upon California; when, as a matter of fact, California has as much to do with it as Tasmania—California's only connection with the whole thing being the fact that it happens to be within California's borders that the property which is the subject of such present meretricious mention is situated, and regarding which such a fanciful prospectus has been issued.

REGARDING Sacramento river improvement, effort is being made to secure sufficient county appropriation to send a delegate to Washington to "lobby," which of all ways of spending money is the most useless in such a case as the one in question. What is required is not lobbying at the seat of national government, but arraignment of the State officials who are acting in defiance of the mandate of the law that makes possible their official existence. Col. Suter has made public his plans for the improvement of the Sacramento river below Sacramento. He says to give seven or eight feet of water below the capital there should be employed both dredging and a system of wing dams and jetties. The points at which the improvements must be made are Iron Horse shoals, at the head and foot of Ida island, near Clarksburg; Heacock shoals, and opposite and below Sacramento. There is, the engineers say, abnormal width of the river at these points, and the construction of works of piling and brush held in place by rocks would be almost sufficient to give the required depth of water. The plan advocated is to place parallel rows of piling, between which there shall be masses of brush and rocks. Above these jetties there should be wing dams of brush. These works are contemplated to be supplemented by dredging at points where the natural work of the waters will not scour out a channel. He estimates that the natural length of the works, including wing dams, will be 18,650 lineal feet, at $14 a foot, which would put the cost at $261,000. The dredging contemplated would add to this $18,750, or a total expense of $280,000. The report also says the surveys above Sacramento and on the Feather river have not been completed. In the House of Representatives yesterday Congressman de Vries introduced a bill appropriating $500,000 for dredging and otherwise improving the Sacramento river and its tributaries. The object of this bill, he says, is to carry out Col. Suter's recommendation for the improvement of the Sacramento river, as outlined above.

No better opportunity for advertising ever presented itself to the mining counties of California than the Golden Jubilee Mining Fair, which opens at Mechanics' Pavilion in this city January 29th and closes March 6. It will be well worth while for every county board of supervisors in the thirty-seven gold producing counties of the State to each appropriate $1000 or $2000 for appropriate representation therein. The supervisors of Nevada county have appropriated the latter sum for appropriate display of that county's mineral resources. The fiftieth anniversary of the discovery of gold in California is being made the occasion of a week of jubilee in the city, at the close of which begins a mining exposition of extraordinary interest. It is in order for every mining county in this State to appropriately represent its mining resources. Several counties have already realized this, but others have not, and it is not too late even yet to take proper interest in this important matter. All county exhibits will be shown on the main floor, and space is now about taken up. The operating machinery will be in Machinery Hall; all exhibits in that department must be in place and operation before the 28th inst. The machinery exhibits will be one of the completest things of the kind ever seen, including the newest, up-to-date mining machinery in every department of gold mining. The scenic effects will be fine and the entire exhibition will be an object lesson in gold mining. The exhibition will be well worth attending, and should be seen by every miner in the State or elsewhere who can make it possible to be present. A unique feature of the exposition will be the Klondike department, and any intending emigrant to that far-off region who sees it will realize that San Francisco is the place for him to get his outfit. The committees in charge are all working together, and the result will be an exhibit well worth seeing.

H. W. C. JACKSON of Rossland, B. C., back from a three months' visit to London, England, his native city, declares that "the methods of the London promoters would be considered outrageous in the United States. Outside of the few strong syndicates, such as the Rothschilds, who never appeal to the public to help them finance any of their new flotations, the London promoters are a most greedy and unscrupulous set. The propositions which they will make to the people bringing over good properties there are almost beyond belief. I learned of several cases in which options had been given on mines to reputed wealthy syndicates, who were supposed to have the money all ready to pay over, but for some reason or another required the vendor to visit London to close up the sale. When the mine owner got there he was coolly informed that the English company was organized and the directors named, and all that remained to be done was for the vendor to pay the registration fees of the English company and underwrite the new concern so that the English public could be given a chance to invest in it. They had not done a thing but organize a paper company; had not put and did not intend to put a dollar of their own into it, and expected the vendor to put up all the preliminary expenses. If the flotation was a success they would make £200,000 or £300,000 out of it and risk nothing. The pressure of money looking for investment in England is enormous, and that gives these fellows their opportunity. Though the investor has been robbed in a shameless way by the company promoter, he seems to be afraid to entrust his investments to others. It might also be said that the latter constitute a close corporation in London, largely through their control of the financial press, which is corrupt beyond belief. There is one paper in London, however, which retains the confidence of the investing public, and rightly so—the *Standard*. Its financial editor, Mr. Wilson, however, has one failing, from the investor's point of view. He almost never recommends a new flotation. As for the London *Times*, for some years past they have pursued a policy of masterly neutrality. Each new flotation is noticed in a brief paragraph, giving the names of the directors, capitalization, etc., but never under any circumstances expressing an opinion as to whether the proposition is good, bad or indifferent. This was not always their policy. That paper, in its time, has exposed some very bad swindles, but the proprietors found this work very unprofitable. In most cases they were sued for libel, with the result that they were out considerably over £100,000 for legal expenses."

ANTIMONY smelters draw their chief supplies from foreign sources. In '96 but two mines in this region, one in California and one in Montana, yielded any, the aggregate being thirty-three tons, worth $1,380. In '97 Idaho produced some. Antimony occurs in three localities in California, but the present price, 8½c, does not warrant production. In '96 the United States imported 2,576,371 lbs. crude and regulus, and 1,180,828 lbs. ore, of a total value of $180,377.

Some Considerations About Roads.

Much has been published herein on the value and necessity to the mining counties of good roads. In the last three years in the counties of Calaveras, Amador and Tuolumne over $1,000,000, direct loss has resulted from the bad condition of the roads at certain seasons. It is noticed that in the last mentioned county the local authorities realize the business requirements, and that this week contracts have been made for building two highways from Jamestown to Sonora and Stent. They will be four miles long each, and will be built with a rock base and a top dressing of gravel.

In this regard it is of interest to note that at a recent meeting at Petaluma, Sonoma Co., Cal., a paper on road making was read by N. S. Frost, a civil engineer. It was an excellent paper throughout, but some statements and illustrations were especially striking. Herewith is reproduced some of them.

Direction of Roads.—The first consideration in road making is the direction. The road should run in a direct line between the initial and the terminal points. Though this principle would seem to be self-evident we frequently see it violated, particularly in the Western States, where the favorite system is to have the roads run on the section lines regardless of topography, convenience or anything else. And yet in nine cases out of ten this is the very worst system that could be adopted. Topography does not run according to section lines, nor do railroads, and these are the guiding features in the location of towns, and yet in laying out a system of roads to connect these towns, it is thought necessary that all the roads should point straight to the north pole, as if every wagon was a relief expedition and loaded with grub for the frozen-in-whalers. I had some experience of the beauties of this system in San Joaquin county. The railroad, which, of course, governs the location of the towns, runs nearly northeast, while the roads follow the section lines, so it was necessary to travel twenty miles south and west to reach a point only fifteen miles distant.

Circumstances, however, alter cases, and while in geometry the straight line is the shortest distance between two points the rule does not always follow in road making. A straight road in a hilly country is a bad road, because either the grades would be very steep, or it would cost a great deal of money to reduce them. The road should wind around the hills instead of climbing over them, but this simple principle is too often disregarded. Roads are carried over short spurs that they might just as well go around, and in many cases the distance would be but little, if any greater. Suppose the half of a watermelon or pumpkin is lying on the ground. It is evident that a straddle bug meeting with this obstruction in his travels, would have no farther to go in passing around it, than if he climbed over it, and it would be a good deal easier. Five hundred feet of elevation is equal to a mile or more on a common road, and considerably more than a mile and a half on a good macadamized one. And this brings us to the proposition that the better the road the greater the evil of grades. For instance, on a railroad, where the resistance is about eight pounds to the ton, or 1-280, a grade of about four inches to the hundred feet will double the resistance and consequently the power required, while on a common road where the resistance is seldom less than 1-20, it would require a grade of five feet to the hundred to double the resistance. On a good macadamized road two feet per hundred would have the same effect. This, however, is no argument against improving the surface of a mountain road.

Importance of Grades.—In establishing a new road there are always some points through which it must pass, say certain low passes in the hills. Between these points the road should follow the grade contour line so that the grade from one ruling point to the other shall be uniform, the uniform grade being always the minimum. In a long ascent it is allowable to introduce level or nearly level stretches, especially at the bends, but there should be no descent on the down grade, as that would necessitate climbing two or more hills instead of one. Two villages with unpronounceable Indian names, in the State of New York, located twenty miles apart, on an equally unpronounceable creek, have a difference of elevation between them of 800 feet. The most level common road between them rose more than 1200 feet in going up the creek and more than 400 feet in going down. The line of a new plank road laid out by a competent engineer rises only the necessary 800 feet on the ascent and has no up-grade at all in the other direction, thus saving one-third of the height in one direction and all of it in the other. Gillespie, in his work on road making, speaks of a road in England where Telford saved 1283 feet of perpendicular height and more than two miles in distance between two points twenty-four miles apart.

Drainage of Roads.—The improvement of our present roads, however, is a more important question at present than the laying out of new ones. The surface should be hard and smooth, free from dust in summer and mud in winter. How is this to be accomplished? The first and most important requisite is thorough drainage. The water must be kept off the roadway, for while drainage alone will often convert a very bad road into a passably good one, no possible amount of labor or expense will make even a tolerably good road until the water is gotten rid of. The roadbed should be well crowned, and provided with capacious ditches on each side, and these ditches should be kept clear of grass, brush and rubbish; the water should have free acess to the ditches from the road, and from the ditches to the natural watercourse.

The Surface.—The surface of the roads should be hard, smooth and non-elastic. A surface of India rubber might be very pleasant to drive over, but it would be killing on the team. As to the importance of smoothness, let us see what is the effect of a stone or rut. Suppose a wagon with its load, weighing one ton, meets a rock four inches high, what will be the power required to pull over it? Let the radius of the wheel be twenty-six inches; the load on it will be 500 pounds. Now, it is easy to calculate from the leverage, that it requires a force of a little more than 314 pounds to pull the wagon over this obstruction. If the road is a tolerably good one the tractive power required to draw the wagon over it will be about one-twentieth of the load or, in the present case 100 pounds. Thus it appears to draw one wheel over a rock four inches high requires more than three times the power that it required to draw the whole load over the rest of the road, but of course no one ever saw a four-inch rock on any of our Sonoma county roads. Take as large a sledge-hammer as you can swing and bring it down on the axle with a force of 170-foot pounds and you have the effect of dropping into a four-inch rut. I have known a four or five-inch chuckhole that could have been filled for 10 cents to cost the owner of the wagon more than $10, and that not very long ago nor very far from Petaluma. If the road is an earth road there should be no stones allowed upon it, as earth and rock can not wear equally and sooner or later stones will project above the surface, and about the worst thing that can be done with a rut is to fill it with stones, as that will soon make a ridge instead of a rut, and while ruts are great friends of the wheelwrights, ridges are by no means friendly to teams.

A great preventive of ruts is wide tires and sprinkling. The sprinkling is being provided for by the Supervisors of this county, and the taxpayers will soon find that the pumps and water wagons are as good an investment as could be made.

Rolling.—Whether the road is of earth, gravel or macadam, it should be rolled with a good heavy roller, a ten-ton steam roller being far the best, and the rolling continued as long as any settlement can be observed, filling all depressions as they appear, and, in case of a gravel or macadam road, the roadbed should be thoroughly rolled before the gravel or broken stone is placed on it. It should be borne in mind that the object of macadamizing is to provide a hard surface for the wheels and to keep the water from the surface of the roadbed. The roadbed has to carry the weight of the stone covering as well as that of the traffic over it, and it is useless to place the covering until the roadbed is prepared for it.

The Supervisors of Sonoma county have made a good beginning by providing pumps and sprinkling wagons. Now let them go a little further and provide one or more ten-ton steam rollers, portable rock breakers and road graders. Most of our roads contain enough rocks to go a long way towards macadamizing a tract from eight to sixteen feet wide, and there are quarries accessible to all. Let the rocks be removed from the roads, and passed through the breaker. The steam roller will furnish power both to transport and operate it, the roads properly graded, the broken rock replaced, and the whole thoroughly rolled. A few years of this, and Sonoma county roads will be a model for the State and will repay the cost over and over again.

A New Chlorination Process.

For gold ores which contain such a percentage of sulphurets as prevents the extraction of the gold either by amalgamation or by chemicals, unless the ore is subjected to an oxidizing roast before treatment, after roasting, chlorination has, since its introduction, been a favorite treatment. A full illustrated description of the latest in this line appeared in the issue of Dec. 18, '97. An additional discovery is reported by M. Etard, Professor of Chemistry at L'Ecole Central, Paris, and by Professor Black of the Otago, New Zealand, University. The two discoveries are protected by patents. This invention claims that its application does not require specially trained or skilled supervision. The original solution as prepared by M. Etard was composed of hydrochloric acid and permanganate of potash; the Black solution contains sulphuric acid, permanganate of potash, and salt. The latter preparation has the advantage of being cheaper in the British Colonies, where hydrochloric has a higher commercial value than sulphuric acid, while its solvent powers are equally as great and rapid. The solution can be applied by percolation or agitation. At a recent public trial the former system was adopted, and 92 per cent of the gold contents of a refractory ore, containing copper salts, extracted after twenty hours' contact. In a laboratory trial upon the same ore, a 92 per cent extraction was effected in five hours by agitation. The cost of the solution differs according to the nature and contents of the ore acted upon, and may be reckoned at $1 per ton of concentrates chlorinated. Theoretically the cost of the solution should vary according to the gold contents of the ore, but practically it varies in proportion to the other metallic contents. What actually takes place in the vats may be represented by the following equations:

ORIGINAL ETARD SOLUTION.

$$6KMnO_4 + 30HCl + 8Au = 8AuCl_3 + 6KCl + 15H_2O + 3Mn_2O_3.$$

BLACK'S MODIFICATION OF THE ETARD SYSTEM.

$$6KMnO_4 + 24NaCl + 15H_2SO_4 + 8Au = 8AuCl_3 + 12Na_2SO_4 + 3K_2SO_4 + 3Mn_2O_3 + 15H_2O.$$

It will thus be seen that theoretically 948 parts of permanganate of potash is required to dissolve 1568 parts of gold. In actual practice with the well-roasted Mount Morgan concentrates containing an undetermined quantity of copper, and working with test plants on a small scale, the consumption of permanganate is .2 lb. per ounce of gold dissolved, or two lbs. per ton of roasted ore treated. As permanganate is by far the most expensive of the ingredients, it is the consumption of this chemical which will determine the value of the invention.

Forests and Rainfall.

Prof. H. A. Hazen presented a paper at the last meeting of the American Forestry Association—a paper which will be read with interest by many Californians, for the relations between forests and rainfall have been a favorite theme of discussion in this State ever since the American occupation. Prof. Hazen begins by asking:

Can it be possible that the cutting away of forests affects the amount of precipitation in any locality? To many no doubt this question will seem easy of answer, but we find the results of study by no means reassuring, and recent investigations have led to almost diametrically opposite conclusions, depending, somewhat at least, upon the feeling of the writer. When we reflect that our rainstorms are of very wide extent, oftentimes over 1000 miles in diameter, and may take their origin and bring their moisture from distances of 1000 miles or more, the thought that man, by his puny efforts, may change their action, or modify it in any manner, seems ridiculous in the extreme.

It has been well established that forests have a most important bearing upon the conservation of rainfall; that the forest floor permits a seepage of water to the source of springs and thus maintains their steady flow; that they hold back the precipitation that falls, especially in the form of snow, thus preventing or ameliorating the effects of dangerous freshets. There is not the slightest doubt of their great importance to the welfare of man, but all these facts do not affect the question of their influence upon precipitation. The following paper is prepared from the standpoint of a meteorologist, and is an attempt to present facts:

The Historical Argument.—Formerly, the historica argument was a favorite one. I quote one of these "It is a familiar fact that there are many regions in Asia and southern Europe, once exceedingly fertile and densely populated, that are now utterly sterile and desolate. The country bordering on the Euphrates and portions of Turkey, Greece, Egypt, Italy and Spain are now incapable of cultivation from lack of rain due to deforestation." The most fertile of all provinces in Bucharia was that of Sogd. Said Malte Brun in 1826: "For eight days we may travel and not be out of one delicious garden." In 1876 another writer says of this same region: "Within thirty years this was one of the most fertile spots of central Asia, a country which, when well wooded and watered, was a terrestrial paradise. But within the last twenty-five years a mania of clearing has seized upon the people, and all the great forests have been cut away and the little that remained was ravaged by fire during a civil war. The consequences followed quickly and this country has been transformed into a kind of arid desert. The water courses are dried up and the irrigating canals are empty." It has also been said that in the older settled portions of New England and the Middle States there are arid hills and worn-out fields, due to the falling off of precipitation from the cutting away of the forest growth. Such quotations and statements might be made to fill a large volume. Without more precise data as to rainfall it would be hazardous to conclude that we have here a case of cause and effect. It is certain that the fertility of these regions in ancient times was due to stupendous irrigating devices and canals, and when these were neglected, through wars and other untoward circumstances, the fertility necessarily ceased. It is certain that there are ruins of enormous irrigating ditches and canals in Babylonia, where history indicates that there was once a teeming population

and great fertility, but where now only a sandy desert greets the eye.

Is the Forest a Cause or an Effect?—Some have said that where our densest forests are found there we have the greatest precipitation. There is no way whereby we can see that such forests would have started unless favored by rainfall, so that the presence of the forest rather indicated the earlier occurrence of practically the same rainfall as at present. Meteorologists are agreed that there has been practically no change in the climate of the world since the earliest mention of such climates. Plants found in mummy cases in Egypt that were plucked thousands of years ago show the same size as those now found in that land. The "early and the latter rains" are experienced in Palestine to-day just as they were four thousand years ago. Jordan "overflows all its banks" to-day in February precisely as it did in Joshua's day. When we come down to recent times, and to the records of rainfall measured in New England for more than one hundred years, or, at least, before and since the forests were cut, we find a constancy in the rainfall which shows its entire independence of man's efforts. Right here it should be noted that totally barren lands of any extent, in New England for example, are to be found only in imagination. Even where the forest has been cut away mercilessly there springs up a growth of sprouts which covers the ground and answers almost the same purpose in causing rainfall (if there is any effect of that kind) as the forest. Even where land is entirely cleared of a forest we have at times the green pasture, and at others still heavier crops which leave the ground anything but a sandy waste.

Rainfall Measurement in Forest and Open.—But the strongest argument adduced in the past to show the influence of forest on rainfall has existed in a comparison between rain-gauge measures in the forest and the open field. Such records have been made for more than thirty years in France and Germany and surely we must have here, if anywhere, a sufficient proof of a forest's influence.

Admitting that we have perfect instruments and careful observers, there still remains a most serious doubt as to the immediate environment of each gauge and as to the possibility of a direct comparison. It is probable that no two gauges 2000 feet apart can be placed so as to catch the same amount of rain, though to all appearances the exposure is faultless in each case. This is plainly seen on the roof of a building. For example, before the office of the Weather Bureau was removed to its present location in Washington, eighteen rain gauges were placed on the roof and one upon the sod not 500 feet away. There was only one of the gauges that gave the same rainfall in all storms as the one on the sod. Some of the others gave more in some storms and some less, but all of them in the total rainfall of eight months gave less than the one which compared exactly with the sod gauge. In an early publication of rainfall records in this country (not by the Weather Bureau, however) two stations are given—Marengo and Riley, in Illinois—not more than three miles apart, but yet differing by 19 inches in the total annual precipitation for several years. I have no doubt that in the latter instance one or both gauges were badly exposed; but enough has been said to show the extreme caution needed in studying such records and the absolute necessity that exists in obtaining a comparison between gauges that are not affected harmfully by their surroundings.

The French Investigations.—One of the best of all researches in this line has been conducted at Nancy, in France. Within a distance of five or six miles there have been four stations established—at Nancy in the open and at Belle-Fontaine in the forest and, 500 feet higher vertically, Amance (open) and Cinq-Tranchees (forest). The latter stations are in a more hilly region and cannot be compared together, as can the former. At the lower stations we have comparative observations for twenty-five years. I have summed these in three groups, containing eight, eight and nine years in each group. First group, Nancy (open), had 31.16 inches, while Belle-Fontaine (forest) had 32.46 inches; second group, 33.39 inches and 34.07 inches; third group, 30.05 inches and 29.89 inches. We see that, while the first eight years showed a very slight excess in the forest rainfall over that in the open field in the last nine years (including 1894, last published), the open station showed a little more rain than the forest station. These observations were made with particular care, for the purpose of exactly determining the influence, and may be relied on if the environments of the gauges were comparable. At Amance (open) and Cinq-Tranchees (forest) the observations have not been quite so regular, though we have twenty-five full years of records at these two stations, but not the same years as at the other stations. Amance shows 26.70 inches and Cinq-Tranchees (forest) 33.39 inches, or an apparent preponderance of 6.7 inches a year in the forest. This would make more than 20 per cent greater in the forest than in the open. It should be borne in mind, however, that these last two stations are on an eminence, and are not strictly comparable, and this result cannot vitiate that at the two other stations, which shows no effect.

German Observations.—In Germany we have a rather remarkable record of a slightly different character. Lintzel is a station on the Luneburg heath, which began to be planted with trees in 1887, at the rate of 1000 to 1500 acres a year, and in a few years over 8000 acres were covered. In the midst of this forest is the meteorologic station in an open field of some seventy-five acres. Before planting the forest 97 per cent of the surface was field, meadow, or heath, and afterward 80 per cent was forest and 20 per cent was roads, open field, and heath. Around this station, pretty evenly distributed, and within fifty miles, there are thirteen rainfall stations, which have been carefully established and presumably are comparable with the Lintzel station in the midst of the growing forest. There is no means of knowing whether any of these stations have been changed or not, but for our purpose we may consider the material homogenous and treat it accordingly. Records from 1882 to 1896 (fifteen years) are available. Charts were prepared for each year, showing the ratio between the Lintzel record and that at each station of the thirteen. There is no space for these charts, but, in place of them, I give here the mean of all the thirteen station ratios for each year: 1882, 81; 1883, 83; 1884, 101; 1885, 103; 1886, 82; 1887, 98; 1888, 93; 1889, 122; 1890, 97; 1891, 100; 1892, 90; 1893, 96; 1894, 142; 1895, 128; 1896, 136.

The Figures Not Significant.—These figures are extremely significant, and may be further elucidated as follows: The smaller ratios show a less rainfall at Lintzel as compared with surrounding stations. It is impossible to determine whether these trees have reached the culmination of their effect or not. In 1896 most of them would be seventeen years old, and the ground would probably be fairly covered. It is a great pity that the environment was changed or some accident happened at Lintzel so as to vitiate the three last years. (As inquiry was sent to Germany regarding the error, but no response has yet been received.) The record does not seem to show any appreciable effect upon the precipitation; in 1884 the ratio was 101, while in 1893, nine years later, it was 96. It is probable that no definite and unassailable result can ever be obtained either by the method adopted in France or this later one in Germany. The rainfall is so variable within a distance of even a mile or two, and it is so difficult, if not impossible, to obtain similar environments at all the stations, that no decisive result can be obtained. It will be seen readily that the multiplication of stations will do no good, and, above all, that the observation of rainfall under trees in a forest is absolutely useless for any such discussion or study as this.

It seems probable that if two or three lines of stations could be established a mile or two apart on four sides of an enormous forest, each line to have a dozen stations or so, about 3000 feet apart, four of the stations to be outside of the forest and the others each in a large, cleared space of at least two acres extent in the forest, something decisive might be obtained. It should be noted, however, that from the evidence already accumulated there would be very little to be gained by a further study of the question. It is certain that the effect, if there be one, is almost inappreciable. The favoring conditions over the forest are balanced by those not favoring and the integrated effect is practically the same in the two cases.

An Inappreciable Gain.—Prof. H. F. Blanford of India determined from a most careful series of records, from which all known errors had been eliminated, that the forest had a tendency to give 2 per cent more rain than contiguous open fields. That is, if an open place had 50 inches of rain in a year a near-by forest would have only 51 inches, which is practically inappreciable.

It would be an interesting study to select all those cases in experiments in forest and near-by fields in which the wind was blowing either from the forest to the field, or vice versa. It is evident that if there is any effect on rainfall by the forest, it would be vitiated if not exactly reversed by such winds.

There is a class of visual observations which seem to show an effect upon rainfall by the forest. Probably many have seen heavy clouds passing over a plain, but which only precipitated as they passed over a forest. Also in a hilly region it is a frequent phenomenon that fog and low-lying cloud hover near a forest, and not over an open plain. One also notes very often in passing into a forest on a damp day that the trees drip moisture, possibly condensed from moisture evaporated from the damp earth underneath. Observations of this nature, however, cannot ordinarily be checked by instrumental means, but show in a general way that the forest tends to conserve vapor and moisture which in the case of the open field would be diffused into the atmosphere.

THE age of a valley is a measure of its stage of development. It may be steep-sided and young; it may be half open or mature; it may be wide open or old. At any stage of its development it may be submerged and buried, and thus preserved until some future time when it is again revealed by weathering, like any other fossil. In this sense the valley, whether young or old, may be dated as geologically ancient or modern.

Notes on Present Western Practice of Metallurgy Economically Considered.

NUMBER III.—CONCLUDED.

By W. B. DEVEREUX.*

In custom smelting works the ore is almost all crushed to a very fine state for accurate sampling and for roasting, and the amount of flue dust becomes a very considerable item and one that cannot possibly be disregarded. All well equipped furnaces, therefore, are provided with dust chambers more or less extensive. These are of many and various types. Some are constructed of brick with hollow walls for cooling, with a total length of passages as much as a mile. Others are constructed of sheet iron with a V-shaped bottom, the whole structure being enclosed to prevent condensation of acid fumes by cooling. The bottom of the dust chambers is provided with openings, so that dust can be drawn off at intervals into a car which runs on a track under the chamber. Another class which is used with very satisfactory results makes the final separation of the fume by filtering through cloth. One type of apparatus for this purpose is a house filled with long bags through which smoke is forced by a ventilating fan. These bags are shaken from time to time, in order to keep the pores from being stopped with dust, and the dust is taken out at intervals from the bottom of the sacks. A later invention than this consists of houses in which are sheets of cotton cloth stretched in tent-shape from the top. The smoke is forced through these, and the tents are beaten at intervals with rods moved by a lever from the outside of the building, the dust falling to the floor. The disposal of the dust has been a very annoying problem. In some places it has been made into bricks with clay or with milk of lime either by hand or by machine. In other places it is immediately put into reverberatory furnaces and heated until it slags together. The fume from the bag houses, however, is combustible, and after a sufficient amount has accumulated on the floor of the house, it is set on fire by throwing live coals on the surface at intervals. Apertures are opened to admit air and a general combustion takes place, sintering the mass together and forming a product something like coke, which is in the very best possible condition for treatment in the furnace. It has also been found that dust collected in the chambers before the smoke reaches the bag house is combustible, and in some works this dust is simply piled in small houses with brick walls and set on fire. Air is admitted and combustion goes on until the whole mass is sintered together. Smelting has now become subject to such competition that there is an absolute necessity for saving all the values possible in the ore. Metallurgists who are working on ores from their own mines are too often careless about their losses, but it is just as reprehensible to lose values when you are working on your own ores, and with much larger margins for loss, as it is when you are working on custom ores where you are in competition with other skillful metallurgists.

I have used a method of blowing in lead furnaces, which I think has sufficient novelty to merit a description. It starts the furnace off in good condition, and with ordinary care gives very little trouble:

The crucible is heated with cordwood, and as soon as the walls are fairly hot a 2-inch pipe, bent at an angle, is inserted through the breast to the bottom of the wood fire and air is blown in. The crucible is filled with cordwood, and, as soon as it is blazing well, several bars of bullion are shoved in on a plank and tipped off on the wood. This bullion melts and runs down through the hot fire to the bottom, becoming red hot. This process is continued until the crucible is full of lead, when the fire is raked out and the lead thoroughly stirred up from the bottom and skimmed. The crucible and siphon are then full of red-hot lead, perfectly clean. Brands and wood are then put back on the lead to form a support for the coke and to kindle it; the breast is put in and the furnace filled with coke to about 18 inches above the tuyeres; then light slag charges and coke to the top of the jackets; then charges, part ore and slag, and finally normal ore charges to the top.

A light blast is turned on until the slag begins to show at the slag taps and it can then be raised gradually to normal pressure. In this way the fusion zone is kept from rising, and the furnace starts off with cool walls and a cool top. If lead makes too slowly and shows a tendency to cool in the well, a few bars can be dipped out and charged into the furnace again.

With this hasty survey, we must leave the subject of lead-silver ore smelting. You cannot fail to realize that neither methods or their limits are yet well defined.

The aim of the best metallurgists may be summed up in a few words:

1. The largest furnaces compatible with good work.
2. Slags which will permit the largest amount of refractory and hence profitable ingredients.
3. A perfect initial separation of slag, matte and bullion by automatic appliances, with mechanical handling of the slag.
4. Economical treatment of lead, copper mattes.

* Condensed from School of Mines Quarterly.

The Bettel Slimes Process.*

The study of the slimes question, which the originator made during his engagement on the Robinson mine, led to the erection of a small plant at the Primrose during 1894. The experience gained there emboldened Mr. Bettel to prophesy, at the opening of the Primrose plant, that zinc precipitation (the MacArthur-Forrest process), when combined with electrolytic action, would run the Siemens-Halske process very close. The reasons for this forecast were repeated on several occasions at the Chemical and Metallurgical Society's meetings—one was the conviction that chemically clean zinc precipitated the gold of an auro-cyanide solution which contained no free sodic or potassic cyanide. This assertion was received with incredulity, but the fact has been abundantly proved. It is on this fact (*i. e.*, that pure zinc as well as the electrolysis plays an important part in precipitation) Mr. Bettel's process, named the "electro-zinc process" is based, and it is to this fact that the really wonderful results, attained with even the present somewhat imperfect plant, are attributable.

The principal troubles experienced in the Primrose experiments were from insoluble anodes and from the difficulty of keeping the electricities separate by means of porous cells; short circuiting sometimes occurred and turned the zinc cathode into an anode. These difficulties (with others) had not been overcome in 1895, but it was clear that the germ of a good process was there. In March, 1896, the inventor was satisfied that most of the difficulties had been overcome, and a syndicate was formed to finance the process, which was being perfected during 1896. Early in this year it was on a working basis, and last May arrangements were made for its exploitation on a commercial scale on the site of the present plant.

In tracing the process through its consecutive stages, it is found that the slimes, as they leave the settling tanks of the sand plant, flow to brick and cement tanks with sloping bottoms; on the road to the tanks, at the head of the delivery launder and just after passing the automatic sampler, the addition of clear lime water takes place.

The clear, supernatant water in these settling tanks is discharged by peripheral overflow until the requisite amount of slimes is collected in the bottom. The water above the slimes is then removed by a decanting pipe of special construction, which does not work automatically, but gives excellent results, even in the hands of an unskilled native laborer. The concentrated slimes are then agitated with air combined with motion, and the homogeneous pulp is elevated thirty feet by means of four-inch centrifugal pumps.

On reaching the highest point in the works, solution of .01 KCy strength is added, and the slimes are allowed to run in company with the solution through at least 300 feet of launder. By this means thorough aeration is assured, as well as intimate mixture, and the gold is dissolved out of the slimes before they leave the launder. Solution of the gold by this means entails a substantial economy in the construction of treatment tanks. It may be noted that it is the inability to dissolve the gold locked up in the sands (which are now carried with the slimes) during the passage along the 300 feet of launder which tends to vitiate the results now being got.

The slimes and solution are then caught in one of two tanks (similar to the settlers described, with the exception of their not being provided with peripheral overflow), the charge of such a tank containing 145 tons of pulp, containing seventy tons of dry slimes, and 200 tons of solution. The charge occupies the tank for about twenty-four hours, including the time occupied by filling and discharging.

The liquor is decanted off by similar decanting pipes to those used in the settling tanks; and the residues, equal to 145 tons, are elevated afresh after agitation to the highest point of the works. Here 200 tons of weak solution (.005 KCy) are added, and the charge is run into the next settling treatment tank. After settling during a like period as before, and after decantation of the weak gold liquor, the residues are agitated and discharged into the residue dam. It is intended to collect any water obtainable from this residue dam and return it for the sake of the precipitation of the gold it contains.

The 200 tons of .005 solution is increased up to a strength of .01 KCy after its decantation from the slimes. The solution is returned to the head of the launder and thence serves as the first solution of the next charge of slimes. This solution (after having done work twice) is pumped into an upward filtration tank of special design, where any turbidity is removed.

The clear liquid is decanted off through a floating syphon of special construction, and is delivered into an equalizing tank of three compartments, which, by means of a differential ball-cock arrangement, allows of the discharge into the extractor boxes under an even head.

The extractor box forms one of the special features of the plant. Those in use at the Comet are 30 feet long by 6 feet wide by 3 feet 6 inches deep, divided into seven longitudinal compartments for anodes and six longitudinal compartments for cathodes. These, again, are subdivided into twelve compartments, giving eighty-four anode compartments and seventy-two cathode compartments. In the anode compartments are placed sheets of lead coated with a non-conducting insoluble varnish, having mixed with it a conducting material practically unoxidizable. The cathode compartments contain perforated zinc cages filled with zinc shavings. Both cathode and anode boxes have terminals, which are fastened to the respective positive and negative poles of the electro-plating dynamo in use, which has a capacity of 400 amperes under twenty-five volts pressure. The separation of the cathode and anode compartments is effected by means of a specially prepared canvas, which, while not interfering with electrolysis, prevents the undue mixing of the anode alkaline solution with the cathode auriferous KCy solution.

This method of precipitation is found to roughly secure three times more speedy a precipitation than the Siemens-Halske method and to extract 90 per cent (in place of the Siemens-Halske 75 per cent) of the gold contents.

The routine of the various washes is that obtaining generally throughout these fields, with the exception that at present only two solutions are being used (by reason of the smallness of the plant) in place of three.

The gold-coated zinc shavings which have done their work in the extractor boxes of this—the electro-zinc—process are then placed in the extractor boxes of the MacArthur Forrest process, the zinc-gold couple in this form having the power of readily precipitating the gold from the ordinary KCy solutions, while the zinc is dissolved and the clean-up is made in the usual way.

At the request of the management of the Comet, Mr. Bettel is making a special clean-up for the purpose of plainly demonstrating the value of the extraction. The sampling and assaying are done by the company's usual staff, the inventor's laboratory being devoted solely to private research and assaying for private guidance.

The first 200 tons of solution running through the boxes assayed .09 dwt. per ton before precipitation and .01 dwt. after precipitation (fine gold), notwithstanding that the zinc had been soaking in the solution without electrolysis for three days—an occurrence which would have effectually stopped precipitation by the Siemens-Halske process. The second solution contained only traces of gold, according to the company's assayer, after precipitation.

The net issue of the results got, up to the present, by practice on a working scale under distinctly unfavorable conditions is that, commercially, the scheme shows up better than as a laboratory experiment and that the value of the process is pretty well established. There will be a widely felt curiosity to learn the full powers of the new method as shown by careful analysis of the results got by regular work under ordinarily favorable conditions.

English Investment in American Mines.

TO THE EDITOR:—Adverting to the several letters that have recently appeared in your columns on or in respect to "English capital in American mines," not the least appreciable in connection therewith is your own general recognition of the proposition or principle that development work undertaken and performed in consideration of acquiring an option to purchase, or not, within a specified period is "not likely to be of detriment to the present owners."

A fitting rejoinder to the correspondent who wrote: "No good mines can be gotten hold of without putting up the cash at once," and which appeared in your issue of the 20th ultimo, may be found in the same number in the very interesting and instructive letter of Mr. Almarin B. Paul, in which he says:

"If English investors allow themselves to be led into unprofitable ventures it is their own fault, as there are any number of individuals in these latter days having a thorough knowledge of vein structure, value of ores, and of extraction of the metals, to steer clear of bad ventures."

To proceed upon any other hypothesis than is here presented by Mr. Paul would be going contrary to common sense and sound business methods. Consequently the contention that if an intending or possible purchaser desires to purchase he must put up money at once cannot be considered seriously. Mines are not and cannot be bought and sold as bushels of wheat or barrels of beer, and before any responsible party can be induced to incur the expenses essential in the preliminary examination, etc., of a mining property it is imperative that a reasonable agreement as to time, as well as to price, should be granted. Offering a good mine does not in any way lessen its intrinsic value to the owner, though it may and doubtless does interfere with the chances of its being taken up by the promoter with unscrupulous propensities, who invariably relies more upon the names he may secure for directors and the "art" he may possess in preparing a prospectus that is likely to be "swallowed" by the guileless and gullible public than he does upon the actual or prospective value of the property. That California mine owners are not all opposed to transferring their mines for a consideration to the care of the British or foreign capitalist is shown by the fact of there having been within four or five weeks three large companies offered on this side, two in London and one in Glasgow. The response given by the public in the matter of subscriptions to one of the two advertised here, viz., the California Exploration, Limited, was, I regret to remark, reported as very disappointing. What response the other one (the Great Northern Industrial Gold Co., Limited, California) may receive is not yet made public, but the promoters have at all events made the most of their directors' names, though whether their having done so will be of great advantage remains to be seen, and a Glasgow correspondent of the writer has asked where the capital (£400,000) is to come from.

The population of California is not big enough yet to do anything like justice to its great mineral wealth, and, such being the case, capital ought to be encouraged in every legitimate manner possible, without regard to where it may come from. If it can be obtained from the Middle or Eastern States so much the better; but if it cannot be "coaxed" there, then it should be sought in the most likely or most satisfactory sources of Europe—that is, if Californians wish to move with the times and not "wall themselves in" against the adventurous spirit and enterprise of the age. Yours truly,

London, Dec. 23rd, '97. RANDOM.

Hydraulic Mining.*

NUMBER IV.

Water Distributing and Gravel Washing Apparatus.—While the dam and the ditch with its appurtenances are being constructed, the gravel-washing and the gold-saving implements and apparatus should be gotten on the ground and put in place, the point where they are to be located being immediately under and in close proximity to the lower end of the ditch. At its lower extremity the ditch empties itself into a section of flume, at the end of which is situated the bulkhead or pressure box, a large oblong receptacle, built of strong planks and so called because the head or pressure of the water is here measured.

Connected with or located immediately above this structure is the sand box, a square compartment sunk several feet below the floor of the flume, the design of this box being to catch any sand or fine gravel coming down the ditch, such material, when it reaches this point, falling into the sink, being the depressed portion of the box, and is there retained. Through a gate at the side of the box this stuff is discharged as often as its accumulation makes it necessary. If much sand is allowed to enter the sand pipe it tends to impair the efficiency of its action.

The pressure box, with a width of about six feet, varies in length from ten to thirty feet, a greater length being required when it has two feed pipes to supply, also where the sand box forms a part of it. For the sand box a wooden apron is placed in the bulkhead and so arranged that it catches the sand and drops it into a chamber below, which is supplied with a discharge gate. A gate is set at the upper end of the pressure box to prevent any floating stuff entering it. There should be water enough in this box to cover the supply pipe to a depth of several feet that no air, or as little as possible, be carried into it, to which end this box is usually divided into two compartments, the water being brought into a placid state in the upper before it enters the lower one. That the water supply and exhaust be kept in equilibrium as near as may be, a waste gate should be placed in the flume above.

The main supply pipe starting from the bulkhead should descend to the washing pit with as few deflections, rises or depressions as possible, as these not only tend to retard the passage of the water through the pipe, but also promote the collection of air within it, rendering an explosion imminent. To obviate this at all times, and to guard against it when filling the pipe, at which time it is much increased, air valves are to be placed at suitable intervals along it. All large water pipes should be equipped with a sufficient number of air valves, these escapes being provided with brass floats, as the wooden ones are apt to swell, and, becoming wedged in the valves, the pressure of the air without is insufficient to press them down. When the bank down which the pipe has to be carried has much inclination, it should be placed on a stout frame work, and, besides being braced on both sides, should be heavily weighted with bowlders as a security against any movement which, should it occur, might cause much inconvenience and possibly serious damage. This pipe for several joints at its upper end is much enlarged to ensure a more free admission of water. Below that point it is all the way of uniform size, or as far down as the junction of the branch pipes, if any there are. In early times the letting on and shutting off of water was effected with a wooden gate, raised and lowered by means of a lever. For this crude and clumsy contrivance there has now been substituted in all large works the heavy cast-

*Begun in issue of Dec. 18th, '97.

iron gate operated by a screw, powerful and easily manipulated. Everywhere now, on the dams, ditches and reservoirs and in the washing pits, these improved structures are in use, differing but little, except in size, and in this according to the service required of them.

A powerful machine of this kind is employed for admitting and shutting off water at the entrance of the main feed pipe. In the performance of this task care should be taken to let on the water gradually, as too great a rush might carry in so much air as to cause a disaster, this being a precaution to be always observed under similar circumstances.

The size of the feed pipe depends on the quantity of water to be transmitted through it, a pipe 22 inches in diameter being sufficient to pass anywhere from 1500 to 2000 miners' inches. When the quantity of water ranges from 3000 to 4000 inches, a 30-inch pipe should be chosen, the friction caused by the passage of the water being less, comparatively, in large than in small pipes. The iron used in the construction of these pipes varies from No. 16 to No. 11 and lower, according to the pressure to which they are to be subjected. For a 22-inch pipe No. 16 iron is usually employed for pressure up to 150 feet; No. 14 from 150 to 200 feet and No. 12 from 200 to 300 feet, the latter being about as great a head as the water is apt to be used under in hydraulic washing. For a 30-inch pipe No. 14 iron has been found to answer for pressure up to 150 feet and No. 12 from 150 to 275 feet.

Before being placed in position these and all other iron pipes to be used in connection with hydraulic mining should be immersed in liquid asphalt, such as is now being manufactured for this and similar purposes. Coal tar, with which these pipes were formerly coated, is now giving place to the asphalt preparation, it having been found equally cheap and more efficacious.

Formerly the lower end of the feed pipe was connected with what was known as the distributor, a short cast-iron box firmly anchored in the washing pit, the duty of which was to receive the water brought in by the feed pipe and distribute it to the several smaller pipes that lead to the giants or monitors, the number of these pipes corresponding with that of the machines to be supplied with water. Being ponderous, costly and liable to burst, the distributor has come to be pretty generally discarded, the plan of connecting all distributing pipes directly with the main feeder, as now practiced, having superseded it.

GLYCERINE is a good thing for tempering steel. The glycerine must have a density of from 1.08 to 1.26 at 150° C., and its weight should be about six times as great as that of the steel to be tempered. For hard tempering, add to the glycerine from one-fourth to four per cent of sulphate of potash or of manganese; and for mild tempering, add one to ten per cent of chloride of manganese or one to four per cent of chloride of potassium.

Mechanical Progress.

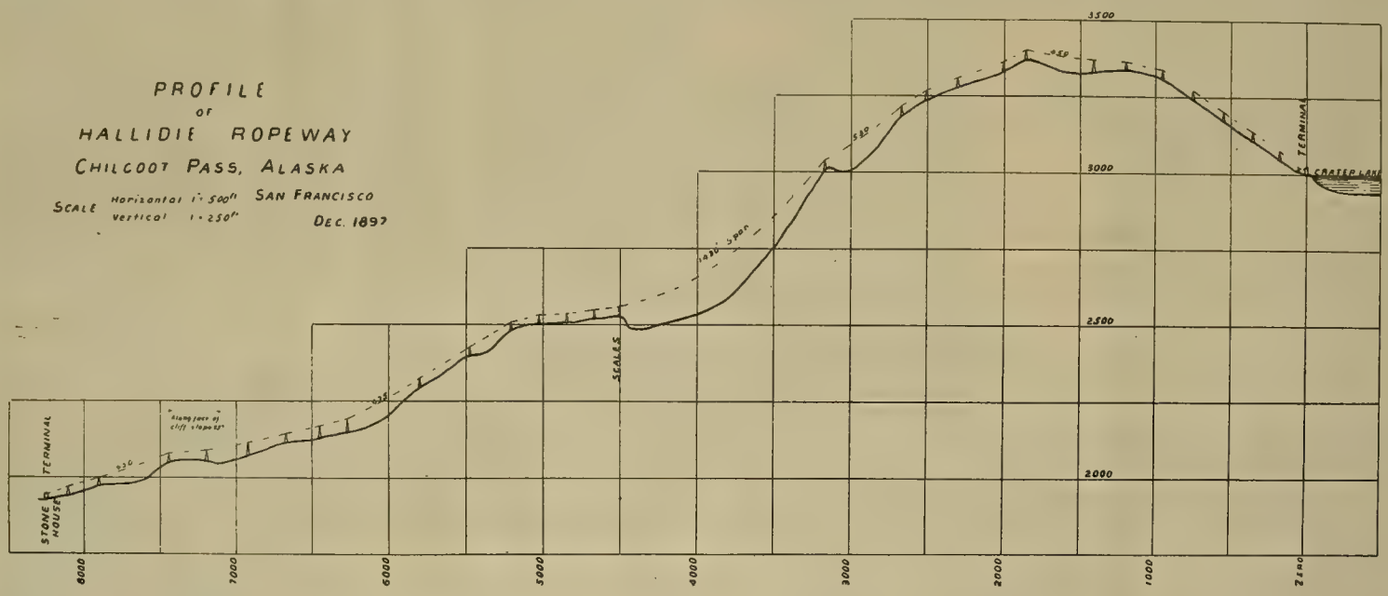
Wire Ropeway Across Chilcoot Pass.

On the 25th ult. this paper furnished its subscribers a map of the Klondike region, and from an inspection of the same it will be obvious that not far from Dyea is the much-dreaded and much-written-up Chilcoot pass. There does not seem, so far as noted, so much difficulty in passengers passing over the gap in the mountain chain as in getting goods over with any degree of dispatch and celerity; and later in the season this difficulty would become intense unless some means were provided to supply the thousands of gold seekers who must subsist and need good, substantial fatty food during the long, dreary days of an Arctic winter, with the thermometer far below zero, sometimes as low as 70°. No moralizing on the folly of people rushing into such a country unprepared will alleviate the condition of affairs which must exist there. From good authority it is learned that the Alaska Railway & Transportation Company of Seattle some time since had a careful survey made of the pass by a firm of experienced engineers of that city, and that a good, feasible route was found for the erection of a wire tramway.

The pass itself would not be so formidable if it were not for the terribly cold and high winds which blow occasionally, on one occasion the wind being so violent as to tear the transit from the grasp of the engineer and carry it beyond his control, doing irreparable damage. But, as it is, it acts as a terrible barrier to the prospector who has to pack his provisions in.

To get over this mountain pass the engineer of the company interested decided, after careful consideration, to adopt the Hallidie single rope system, and then at once ordered a line constructed in San Francisco for immediate shipment. Already most of the material has gone forward and the work of construction is well advanced; and it is believed that by the time this number is issued the entire machinery—cable, carrier, pulleys and driving gear—will have been shipped, leaving only a 45 H. P. engine to follow by next steamer. The company does not intend to transport heavy pieces, but to take the loads as packed for the mules and send them over. With the line now in course of construction 150 tons per day can be transported, or about 4500 tons per month; and the earnestness with which this work is being pushed speaks well for the foresight and business considerations which influenced such—as it happens to be—a humane undertaking. And while it is not to be expected that such a work will be carried through without some setbacks, the Hallidie system of tramway has been tried under so many difficult conditions that it is felt that relief will be at once the result of its completion.

By referring to the accompanying profile of the Chilcoot pass, over which the tramway will run, it will be seen that in a horizontal distance of 6000 feet it rises 1550 feet, and then in 1850 feet falls 400 feet to the level of Crater lake. The rocks on part of the route stand at an angle of 70°, and part of the line ascends at an angle of 35°. So abrupt are some of the gorges that clear leaps of 400, 500 and 600 feet are made, and in one instance a clear jump from point to point of 1430 feet.



It is not proposed to permit passengers to pass over the line, if the business of the line would permit it, as, cooped up in a tramway basket and exposed to such extreme cold and high winds, they would reach their destination in a frozen condition.

Mr. Stixrud of Stixrud & Nansen, civil engineers, of Seattle, in charge of the work, was in San Francisco recently on business connected with this enterprise.

The trail begins where the Dyea river empties into the inlet, runs along the river and up the Dyea canyon, thence up a steep and rocky ascent to the summit, which is 3600 feet above sea level and seventeen miles from Dyea, thence by easy descent and across several lakes to Lake Linderman, thirty miles from Dyea. Horses and pack animals can be used for a distance of fourteen to fifteen miles from Dyea, but beyond this point to the summit everything must be carried on the backs of men.

For six miles from Dyea the route is nearly level and easy traveling, the river being navigable for canoes. Leaving this point one enters Dyea canyon, and thence for six miles through marshes, over boulders, across streams, to Sheep Camp, 1200 feet elevation. From Sheep Camp the trail is very steep, and two miles beyond is Stone House; thence two miles to the Scales, at the foot of the pass. Then begins the hard travel for one and a quarter miles—trail sometimes 45°—to the summit, thence by a fairly good road, half a mile long and a descent of 400 feet, Crater lake is reached, two miles long.

It will be noted that the wire tramway starts from Stone House, passes over the summit to Crater lake in an air line 1⅝ miles against 3¾ miles by the trail.

"PIG IRON" is a mere play upon the word "sow." When iron is melted it runs off into a channel called a sow, the lateral branches of which are called the pigs. Here the iron cools, and is called pig iron. Sow has nothing to do with swine, but is from the Saxon "sawan"—to scatter.

Brazing Crucible.

A newer process is liquid brazing. Several years ago it was demonstrated by a company formed for that purpose that a specially treated joint, plunged into molten spelter, would not only braze in a very few seconds, but would come out almost entirely free from scale, a brisk cleaning by a metal brush being about all the after treatment required. The process was a secret one; the most important point being the anti-flux, which was a preparation painted over the parts to which it was desired the spelter should not adhere. Briefly, liquid brazing consists in reducing the spelter to a molten form in a suitably shaped crucible at a high temperature and then immersing the joint to be brazed in the liquid mass. The surfaces to be brazed are painted with a flux and the adjacent parts with an anti-flux.

STEAM ENGINEER JOHN DUNN has a pretty piece of mechanism in the shape of a new and simple steering gear. The invention is extremely simple and is said to possess many advantages over other steam steering gears, for the reason that it is operated by a single rod, which is either advanced or drawn out, according to the wishes of the operator. The combination works similarly to the device in a pair of opera glasses that enables one to obtain a focus of the lenses. Regarding his connection with the filibuster steamer Three Friends, he humorously recites that it was in the hour of peril that the idea that has resulted in the completion of an almost perfect steam steering gear was conceived. "One day while out on a filibustering voyage to the island of Cuba a report arose on shipboard that a Spanish man-of-war lay to the eastward of our position and that her funnels had just begun to show signs of increasing steam. She headed for us. I stepped outside the engine-room to take a peep at her with my glasses," he says, "but I did not have the proper focus and began to turn the thumb screw affixed to the center bar of the glasses, when the idea struck me that, if the movement were reversed, with sufficient power back of it, the center piece could be made to revolve safely and very accurately. I investigated the matter and found that I was right."

BY a simple rule the length of the day and night, any time of the year, may be ascertained by simply doubling the time of the sun's rising, which will give the length of the night, and double the time of the setting will give the length of the day.

Scientific Progress.

Signaling Through Space Without Wires.*

In 1884 messages sent through insulated wires buried in iron pipes in the streets of London were read upon telephone circuits erected on poles above the housetops, 80 feet away. Ordinary telegraph circuits were found in 1885 to produce disturbances 2000 feet away. Distinct speech by telephone was carried on through one-quarter of a mile, a distance that was increased to one and one-quarter miles at a later date. Careful experiments were made in 1886 and 1887 to prove that these effects were due to pure electro-magnetic waves, and were entirely free from any earth conduction. In 1892 distinct messages were sent across a portion of the Bristol channel between Penarth and Flat Holm, a distance of three and three-tenths miles. In 1895 the cable between Oban and the Isle of Mull broke down, and as no ship was available for repairing and restoring communication, communication was established by utilizing parallel wires on each side of the channel and transmitting signals across this space by these electro-magnetic waves.

The apparatus (Fig. 1) connected to

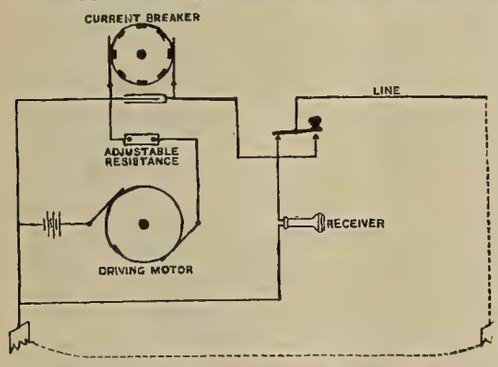


FIG. 1.—Diagram of connections of Mr. Preece's system.

each wire consists of: (*a*) A rheotome or make and break wheel, causing about 260 undulations per second in the primary wire. (*b*) An ordinary battery of about 100 Leclanche cells, of the so-called dry and portable form. (*c*) A Morse telegraph key. (*d*) A telephone to act as receiver. (*e*) A switch to start and stop the rheotome.

Good signals depend more on the rapid rise and fall of the primary current than on the amount of energy thrown into vibration. Leclanche cells give as good signals at three and three-tenths miles distant as 2½ H. P. transformed into alternating currents by an alternator, owing to the smooth sinusoidal curves of the latter; 260 vibrations per second give a pleasant note to the ear, easily read when broken up by the key into dots and dashes.

In my electro-magnetic system two parallel circuits are established, one on each side of a channel or bank of a river, each circuit becoming successively the primary and secondary of an induction system, according to the direction in which the signals are being sent. Strong alternating or vibrating currents of electricity are transmitted in the first circuit so as to form signals, letters and words in Morse character. The effects of the rise and fall of those currents are transmitted as electro-magnetic waves through the intervening space, and if the secondary circuit is so situated as to be washed by these etheral waves, their energy is transformed into secondary currents in the second circuit, which can be made to affect a telephone and thus to reproduce the signals. Of course, their intensity is much reduced, but still their presence has been detected, though five miles of clear space has separated the two circuits. Such efforts have been known scientifically in the laboratory since the days of Faraday and Henry, but it is only within the last few years that I have been able to utilize them practically through considerable distances. This has been rendered possible through the introduction of the telephone.

In July last Mr. Marconi brought to

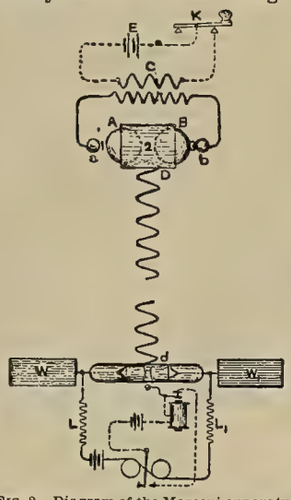

FIG. 2.—Diagram of the Marconi apparatus.

England a new plan. My plan is based entirely on utilizing electro-magnetic waves of very low frequency. It depends essentially on the rise and fall of currents in the primary wire. Mr. Marconi utilizes electric or Hertzian waves of very high frequency, and they depend upon the rise and fall of electric force in a sphere or spheres. He has invented a new relay which, for sensitiveness and delicacy, exceeds all known electrical apparatus.

The peculiarity of Mr. Marconi's system is that, apart from the ordinary connecting wires of the apparatus, conductors of very moderate length only are needed, and even these can be dispensed with if reflectors are used.

The Transmitter.—His transmitter is Professor Righi's form of Hertz's radiator (Fig. 2). Two spheres of solid brass, 4 inches in diameter (A and B), are fixed in an oil-tight case D of insulating material, so that a hemisphere of each is exposed, the other hemisphere being immersed in a bath of vaseline oil. The use of oil has several advantages. It maintains the surfaces of the spheres electrically clean, avoiding the frequent polishing required by Hertz's exposed balls. It impresses on the waves excited by these spheres a uniform and constant form. It tends to reduce the wave lengths; Righi's waves are measured in centimeters, while Hertz's were measured in meters. For these reasons the distance at which effects are produced is increased. Mr. Marconi uses generally waves of about 120 centimeters long. Two small spheres, *a* and *b*, are fixed close to the large spheres, and connected each to one end of the secondary circuit of the induction coil C, the primary circuit of which is excited by a battery E, thrown in and out of circuit by the Morse key K. Now, whenever the key K is depressed sparks pass between 1, 2 and 3, and since the system A B contains a capacity and electric inertia, oscillations are set up in it of extreme rapidity. The line of propagation is D *d*, and the frequency of oscillation is probably about 250 millions per second.

The distance at which effects are produced with such rapid oscillations depends chiefly on the energy in the discharge that follows. A 6-inch spark coil has sufficed through 1, 2, 3, up to 4 miles, but for greater distances we have used a more powerful coil—one emitting sparks 20 inches long. It may also be pointed out that this distance increases with the diameter of the spheres A and B, and it is nearly doubled by making the spheres solid instead of hollow.

The Receiver.—Marconi's relay (Fig. 2) consists of a small glass tube four centimeters long, into which two silver pole-pieces are tightly fitted, separated from each other by about half a millimeter—a thin space which is filled up by a mixture of fine nickel and silver fillings, mixed with a trace of mercury. The tube is exhausted to a vacuum of 4 mm., and sealed. It forms a part of a circuit containing a local cell and a sensitive telegraph relay. In its normal condition the metallic powder is virtually an insulator. The particles lie higgledy-piggledy, anyhow, in disorder. They lightly touch each other in an irregular method, but when electric waves fall upon them they are polarized—order is installed. They are marshaled in serried ranks; they are subject to pressure—in fact, as Professor Oliver Lodge expresses it, they cohere—electrical contact ensues and a current passes. The resistance of such a space falls from infinity to about five ohms. The electric resistance of Marconi's relay—that is, the resistance of the thin disc of loose powder—is practically infinite when it is in its normal or disordered condition. It is, then, in fact, an insulator. This resistance drops sometimes to five ohms, when the absorption of the electric waves by it is intense. It, therefore, becomes a conductor.

It is curious that hills and apparent obstructions fail to obstruct. The reason is probably the fact that the lines of force escape these hills. When the ether is entangled in matter of different degrees of inductivity the lines are curved, as in fact they are in light. Fig. 3 shows how a hill is virtually bridged over by these lines, and consequently some electric waves fall on the relay. Weather seems to have no influence—rain, fogs, snow and wind avail nothing.

The wings in Fig. 2 may be removed. One pole can be connected with earth, and the other extended up to the top of the mast, or fastened to a balloon by means of a wire. The wire and balloon or kite covered with tinfoil becomes the wing. In this case one pole of the transmitter must also be connected with the earth. This is shown by Fig. 4.

There are some apparent anomalies that have developed themselves during

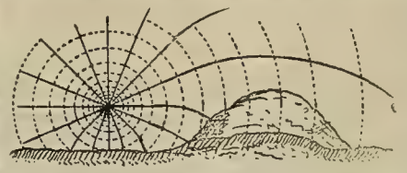

FIG. 3.—Diagram illustrating the way in which hills are bridged by the electric waves.

the experiments. Mr. Marconi finds that his relay acts even when it is in a perfectly closed metallic box. This is the fact that has given rise to the rumor that he can blow up an ironclad

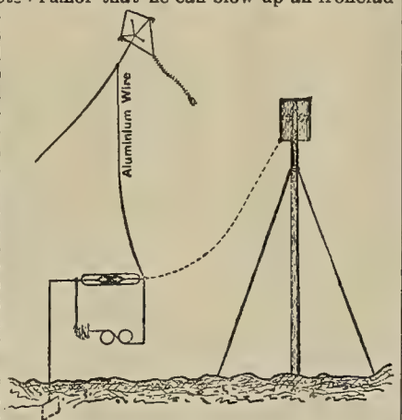

FIG. 4.—Diagram of Marconi connections when using pole or kite.

ship. This might be true if he could plant his properly tuned receiver in the magazine of an enemy's ship. Many other funny things could be done if this were possible. I remember in my childhood that Captain Warner blew up a ship at a great distance off Brighton. How this was done was never known, for his secret died shortly afterward with him. It certainly was not by means of Marconi's relay.

The distance to which signals have been sent is remarkable. On Salisbury Plain Mr. Marconi covered a distance of four miles. In the Bristol channel this has been extended to over eight miles, and we have by no means reached the limit. It is interesting to read the surmises of others. Half a mile was the wildest dream.

It is easy to transmit many messages in any direction at the same time. It is only necessary to tune the transmitters and receivers to the same frequency or note. I could show this here, but we are bothered by reflection from the walls. This does not happen in open space. Tuning is very easy. It is simply necessary to vary the capacity of the receiver, and this is done by increasing the length of the wings W in Fig. 2. The proper length is found experimentally close to the transmitter. It is practically impossible to do so far away.

It has been said that Mr. Marconi has done nothing new. He has not discovered any new rays; his transmitter is comparatively old; his receiver is based on Branly's coherer. Columbus did not invent the egg, but he showed how to make it stand on its end, and Marconi has produced from known means a new electric eye more delicate than any known electrical instrument, and a new system of telegraphy that will reach places hitherto inaccessible. There are a great many practical points connected with this system that require to be threshed out in a practical manner before it can be placed on the market, but enough has been done to prove its value, and to show that for shipping and lighthouse purposes it will be a great and valuable acquisition.

The Sun's Convulsions.

Cambridge professors ridicule the theory that a new world is being thrown off from the sun owing to the activity of sun spots. Prof. E. C. Pickering, director of the Harvard Observatory, says: "Such incredible reports discredit astronomy. The only things to be seen on the sun, to my knowledge, are sun spots. These do not produce any unusual excitement. Sun spots are not uncommon. This one is simply reported to be unusually large."

Prof. Young of Princeton University says of the theory that a new world is about to break away from the sun: "It's all bosh. The thing that has caused all this stir is the discovery of a new sun spot, which has suddenly burst into prominence. People can rest assured that a planet has not broken off from the sun and that there is no truth in the statement that it is traveling away from the sun and threatens to destroy the earth." The junior class, under the direction of Prof. Young, were interested observers of the new sun spot.

Prof. William R. Brooks of Smith Observatory, New York, reports the discovery of two groups of spots on the sun approaching the center of the disk. The publication of the statement has caused some sensational papers to characterize these spots as immense earth destroyers and are dancing in space with no known objective point, and one of them quoted from Revelations vii to sustain the fearful predictions it made.

"That is all nonsense," says Prof. John K. Ross of Columbia University. "Special students of the sun have long studied what are the effects of sun spots on the earth. No idea has yet been reached of what the proper effect is. These studies of the sun are shown by well authenticated records to have begun as early as 1610, while in China the records go back many, many years before that time. To-day all the leading observatories daily take photographs of the sun and keep an accurate record.

Creation of Fancy.—"The idea that sun spots break away from the sun's surface and are launched into space is

* Condensed from an address given before the Royal Institution by W. H. Preece, Esq., C. B., F. R. S., M. Inst. C. E.

them are generated the currents which the machine produces. These currents are produced by the revolutions of the poles or projections on the revolving inner steel ring. Around each of these projections there is a coil or copper strap, of which each turn is insulated from other turns and from the steel pole by mica. Current is sent through the coils on these polar projections, which strongly magnetizes the poles. The revolution of these magnetic poles in front of the copper bars in the outward part of the machine induces current in them. These currents are alternating currents, which are continually reversing in direction at the rate of 3600 times per minute. Three conductors are carried from the machine, which is wound for giving three phases. The currents in the different conductors do not occur at the same time, but have their maximum values in regular succession.

The recently completed Lachine Rapids plant, where a small fall of 14 feet has been harnessed to supply 25,000 H. P. power is another example of the remarkable development of the St. Lawrence, the water in which is now being used over and over again, each time at a lower level, for the driving of turbines, these in turn being employed to generate electric current.

Electrical Progress.

A Great Water Power at Massena, N. Y.

A great power project, that will in many respects rival the mammoth plants at Niagara, is quietly being laid on the shores of the St. Lawrence river at Massena, N. Y. The company is known as the St. Lawrence Power Co.; was organized under the laws of New York State with a capital of $2,000,000 and increased to $6,000,000, to engage in the work of development. As a whole, the project is one of the greatest for the development of a river's energy to be found outside of Niagara Falls. Unlike the largest power scheme at the Falls, the water will be conveyed to the turbines through a surface canal. In this respect the plan resembles that of the Niagara Falls Hydraulic Power & Manufacturing Co. at Niagara. The canal will be three miles long, start from Dodge's creek southerly to Grass river, one mile below. The level of the water in Grass river is about 45 feet below that of the St. Lawrence at the point where the canal will start, and the water will be delivered on the turbines at a head of a little over 40 feet. The width of the canal will be about 225 feet, the depth about 25 feet. Its longitudinal grade will be about 6 inches to the mile, causing the water to flow at a speed of about four miles per hour.

It is estimated that in the construction of this waterway over 8,000,000 cubic yards of material will be removed, and that this, if piled 545 feet high, would entirely cover a ten-acre field to that depth. However, as the excavation is practically all to be made in earth, the expense as compared to the service rendered will be moderate. The head of the canal has been so located on the St. Lawrence that a promontory will serve to deflect all the ice and drift of whatever kind toward the opposite shore when it comes down the river. The new style of dirt conveyor is similar in general design to those at work on the Chicago drainage canal, and is a massive piece of machinery. It stands 60 feet high, length 230 feet, mounted on trucks run on a railway on the bed of the canal. The entire length of the machine is traversed by an endless chain carrying buckets, and as fast as steam shovels can loosen the earth it will be seized by these buckets and carried to the other end of the conveyor, there to be dumped well outside of the line of the canal. The power house will stand on masonry piers built upon the rock bed of Grass river, will be 130 feet wide and 526 feet long. Large inlets will be built to receive the water from the stream, thus necessitating the removal and excavation of many cubic yards of earth and rock. The first installment of power to be developed will be 75,000 H. P., leaving water enough available in the canal to double this output when demand makes it necessary. The rock bottom of the Grass river will be excavated to a sufficient depth to allow the water passing through the turbines to flow freely away. Thus it is apparent that the great St. Lawrence river will be the head race of the power plant, and the Grass river will be the tail race. The conditions that will surround the installation of the power apparatus in the power station will be novel, and wholly unlike those found in other celebrated water-power developments. In the central station of the Niagara Falls Power Co. at Niagara Falls the turbines of the pit are horizontal, mounted on a vertical shaft many feet long, at the upper end of which, in the power house, are the great dynamos. In this new St. Lawrence plant the turbines will be vertical on horizontal shafts. Four turbines will be necessary to the operation of each dynamo, and as there will be fifteen dynamos, each of 5000 H. P. capacity, it will require no less than sixty turbines for the 75,000 H. P. to be first developed. The dynamos will be directly connected with the turbines, but 80 feet distant from them.

The machines are to be of the same capacity as those at Niagara Falls—the largest ever built. No other electrical machines exceed 2500 H. P. in capacity. A machine of 5000 H. P. involves the highest class of electrical and mechanical design; the only machines of this size that have ever been built or undertaken have been by an American company. There are many obscure and difficult points to be determined regarding the proportions of the iron and windings in such machines and the large size and great strains brought on the shafts and other parts of the machine are much more difficult to determine than in machines of ordinary size. The machines for the St. Lawrence Power Co. are not only of large size, but they involve a new design and are in many ways different from other machines. Each of these great machines will weigh about 350,000 pounds, the weight of one piece being as great as 125,000 pounds. The machine will stand 22 feet high above the top of the foundations, and each machine will occupy a floor space of 22 feet by 18 feet. The machines have horizontal shafts, which are in line and directly connected with the shafts of the water wheels by which they are driven. The shaft of a dynamo carries a great ring of steel which is very similar to a large and heavy flywheel. This steel ring carries at its circumference twenty external projecting pole pieces.

The ring and pole pieces are of one solid casting of steel. The ring has an extreme diameter of 15 feet and is about 3 feet wide. It is supported from the shaft by a massive cast-iron hub, with ten great radial arms or spokes. The steel for rings is designed for very great strength; it revolves at a speed of nearly two miles a minute, and the centrifugal force is such that each pound at the circumference tends to fly outward with a force of nearly 100 pounds. The speed of the machine is 180 revolutions per minute. This great steel ring with the projecting poles revolves inside of a large stationary ring or cylinder, whose inner surface is made of plates of thin, soft steel on edge. These thin steel plates are held by a massive outer ring of cast iron, which has a total height of 22 feet.

The thin steel plates which form the inside of the stationary part have slots in which are laid copper bars parallel with the shaft of the machine. These bars are insulated with mica, and in simply a creation of the brain of the writer. The spots are believed by most astronomers to be cavities or depressions in the photosphere filled with gases and vapors which are cooler than the surrounding portions and therefore absorb a considerable portion of light. The fact that they are cavities is shown by the change in the appearance of a spot as it approaches the edge of the disk. When a normal spot is near the center of the disk the nucleus is nearly central. As it approaches the edge the penumbra becomes wider on the outer edge and narrower on the inner, and just before the spot disappears around the limb of the sun the penumbra on the inner edge disappears, the appearance being precisely such as would be shown by a saucer-shaped cavity in the surface of a globe.

"The diameter of the umbra of a sun spot ranges all the way from 500 to 1000 miles for a very small one to 50,000 or 60,000 miles in the case of large ones. The penumbra surrounding a group of spots is sometimes 150 miles across, though that would be rather an exceptional size. The present one is estimated at about 100,000. Not infrequently sun spots are large enough to be seen by the naked eye, and they have been often so seen at sunset or through fog.

"The depth by which the umbra is depressed below the general surface of the photosphere is very difficult to determine, but it seldom exceeds 2500 miles, and is oftener between 500 and 1500 miles. The duration of a spot varies; sometimes it lasts a few days and sometimes a month or two. The spots never show themselves near the poles of the sun, but find their greatest development about 10° north or south of the sun's equator."

Personal.

N. W. TOMPKIN of Sonora, Cal., is in San Francisco.

T. T. LANE has gone from Angels, Cal., to Nevada.

C. E. BARRICK is Mgr. Magenta mine at Granite, Colo.

JAS. BREEN will be the Mgr. Le Roi smelter at Northport, B. C.

W. R. ECKART has returned to San Francisco from Grass Valley, Cal.

HON. E. C. VOORHEIS of Sutter Creek, Cal., was in San Francisco this week.

A. D. GASSAWAY, Supt. Magalia mine, is in San Francisco from Magalia, Cal.

F. E. WHEELER is supervising the erection of a milling plant at Creede, Colo.

E. M. ARMSTRONG, Supt. Oro mine, Iowa Hill, Cal., has returned from Woodland.

SUPT. GRAY of the E. P. Allis Co., Milwaukee, Wis., is in San Francisco this week.

R. DAVIS succeeds M. Thomas as Supt. of the Deadhorse mine, at Summersville, Cal.

S. R. PORTER has succeeded G. M. Ross as Supt. of the Baliol mine, Sutter Creek, Cal.

J. E. POINGDESTRE will have charge of the Yuba county exhibit at the Golden Jubilee Fair.

T. L. MITCHELL succeeds L. L. Patrick as Mgr. of the Montezuma mine in the Slocan, B. C.

GEO. BLAKE, Supt. Bell mine. Jamestown, Cal., has returned to the mine from San Francisco.

W. CAMERON, Supt. Occidental mine, Iowa Hill, Cal., has returned to the mine from Milpitas.

C. HENDEL of La Porte, Cal., is in San Francisco.

J. M. WILMANS of Newman, Cal., is in San Francisco.

SUPT. TANGERMAN of the American mine, Jackson, Cal., has returned to the mine from San Francisco.

M. P. BOAG of Berkeley is supervising the construction of a 40-ton capacity cyanide plant at Calieate, Cal.

PAUL A. FUEZ of St. Louis, Pres. Bimetallic Co., is on a visit to the mine at Philipsburg, Mont.

CAPT. S. NICKERSON has returned from Boston to Paschal, N. M., to take charge of the Val Verde copper mines.

COL. J. L. COLE leaves San Francisco to-day for Newcastle, Cal., to take the management of the Montauk mine.

CAPT. R. A. PARKER of the London Improvement Co. has returned to San Francisco from the Virginia mine, Mariposa Co., Cal.

D. H. COLE, of the Ribbon Rock mine, Sonora, Cal., is at the Zantgraf mine, Newcastle, Cal., inspecting his recent purchase.

MR. SAM'L J. HENDY, treasurer of the Cal. State Miners' Association, has been elected a trustee of the San Francisco Mechanics' Institute.

JOSEPH MCGILLIVRAY, who was for many years prominently connected with mining in this State, and is now associated with the London Exploration Co. in fitting up mines in British Columbia, is expected to return to this city for a short visit next week.

COLONEL W. H. H. Heuer and Lieutenant Arthur Deakyn, of the Debris Commission, visited the Kate Hayes hydraulic mine, on the South Yuba river, Cal., yesterday, to inspect the debris restraining works. An application of the owners for a permit to work the mine under the Caminetti act is pending before the Commission.

Coast Industrial Notes.

—Beef cattle in Reno, Nev., sell for $6.30 net per hundred lbs. on the cars.

—Cigars are now being made in southern California from home-grown tobacco.

—Output of beet sugar from southern California factories in 1897 amounted to 17,000 tons.

—Work has shut down on the construction of the Mexican Southeastern railway pending reorganization.

—Asphalt shipped from Santa Barbara county, Cal., in 1897 amounted to 583 cars, valued at $150,000.

—There are 37,000 acres in southern California set out to oranges and 12,000 to lemons, the latter being mostly young groves.

—In '97 the orange and lemon crops netted Riverside county $1,250,000. The southern California orange crop of 1897-98 is estimated at 12,000 carloads, or 4,032,000 boxes.

—The earnings of the Mexican National railroad for the second week of December were $117,581.30 as against $98,553.82 for the same week last year, an increase of $24,027.48.

—A party of fourteen prospecting engineers representing capitalists interested in the construction of the Nicaragua Canal are en route to Nicaragua, where they will investigate as to the feasibility of undertaking the completion of the canal and submit a report.

—The Stockton and Tuolumne County Railroad Co. organized in San Francisco last week to build and operate a railroad from Stockton through San Joaquin, Stanislaus, Calaveras and Tuolumne counties, to Summerville, Cal.; capital stock, $1,000,000; subscribed, $60,000.

—It is announced on presumably good authority that Symon & Camacho sold their railway, from Altata to Culiacan, State of Sinaloa, Mexico, and that the purchaser is C. P. Huntington. It is also stated that Mr. Huntington will at once extend the International from Durango to Culiacan.

—California's '97 fruit and vegetable pack was 2,426,000 cases, worth about $5,000,000, as follows: Tin, 58,224,000 cans, $1,145,000; Sugar, 700,000 pounds, $357,000; Fruit, 86,000,000 pounds, $2,087,000; Asparagus, 4,900,000 pounds, $100,000; Peas, 2,100,000 pounds, $24,000; Tomatoes, 21,600,000 pounds, $100,000; Boxes and labels, $291,000; Labor, $727,000; Fuel, etc., $160,000.

—The Commissioner of the General Land Office commissioned United States Forestry Agent Allen to examine the country in the vicinity of Lake Tahoe with a view to setting it aside as a forestry reserve. Agent Allen handled his report at Washington and recommends that a reservation be set apart in the vicinity of the lake. He thinks the reservation should include lands on the upper Truckee river and the head waters of the Cosumnes and American rivers. If this recommendation is carried into effect it will probably interfere with the lumbering operations now being carried on in the vicinity of Lake Tahoe. The lake is the largest body of water high up in the Sierra Nevada and the scenery in the vicinity the grandest. It is the source of the Truckee river, which has the distinction of rising in a lake which has no other outlet, and sinking in Pyramid lake, which has no outlet whatever, the immense volume of water which empties into it in the spring and early summer evaporating early in the season.

—In 1895 what is known as the Lyons Commission went to China for the purpose of remaining there two years to study the commercial and industrial condition of that country, with a view to increasing the business between China and France. The commission consisted of thirteen members, each representing a prominent French chamber of commerce. It is known as the Lyons Commission because it originated in Lyons, France. It remained in China two years, the last member returning from there last October. The commission has not yet made known the full results of its investigations, and probably does not intend to do so. It says the people are adroit, industrious and love money, but do not know how to make it. The mandarins, the lettered classes generally, are, above all others, discontented, and are openly or sullenly hostile. They are the principal benficiaries of the present regime. France counts largely upon her Indo-Chinese empire as a nucleus around which to build up her trade in China, and calculates to receive the co-operation of Russia in many ways. It is contemplated to open the way for a more extended commerce by beginning with bazaars, to be conducted by Frenchmen with Chinese in subordinate positions wherever it will be found possible to employ them. It is announced that Franco-Russian bazaars will be opened in St. Petersburg and Moscow during the coming winter. China, says one of the commissioners, is rich, but the people are lacking in economic machinery in keeping with that of wealth. The absence of transportation is the great obstacle to business; but even a greater hindrance is the lack of credit. Everything in the nature of rapid circulation and business confidence must be created. Population and production are only developed on the surface. The higher ability to produce and the greater capacity to enjoy and consume are dormant. The reforms contemplated will increase tenfold the productive capacity, with a consequent increase of the purchasing power of the enormous population. Evidences of a disposition to adopt modern methods are now conspicuous in the building of railroads and the introduction of machinery. The constantly growing foreign debt will soon force China to reform its financial policy, which can only be done by outside help. The nation that establishes trade throughout China, builds railroads, and introduces improved methods of water transportation will probably reform the finances and monopolize much of the trade.

Mining Summary.

CALIFORNIA.

Amador.

The South Eureka will be the first mine in the county to test the electric power furnished by the Blue Lakes plant.

C. A. Holbrook, who successfully worked the Belden mine tailings by the cyanide process, is working the tailings from the old Thercroft mine.

Prospecting is being pushed along the entire lode.

In Jackson, the new 40-stamp mill of the Argonaut, in its first month's run, produced over $50,000.

In Sutter Creek, the Wildman, South Eureka and Baliol are kept steadily at work.

Dispatch: A mill will be erected on the Hirschle ranch. It is understood that a San Francisco man has taken an interest in the mine.

The Dooley Bros. have their stamp mill on the McKinney property, near Mountain Spring, in operation.

A Jackson dispatch of the 5th says: The heaviest shipment of bullion ever made from Jackson was sent out yesterday. The Zella, Kennedy and Argonaut mines shipped a total of about $70,000. The first month's run of the Argonaut yielded over $50,000. This mine has made three shipments for the month.

Butte.

Suit has been commenced by the Lady Alice G. M. Co. against T. Z. Blakeman, D. Gage, H. Gage, W. Lynch, C. Helman. This is in the matter of the Cherokee Placer mine, also the Cherokee Drift Gravel mine.

Last August, Goodall, Perkins & Co. asked the Court for an injunction enjoining the Golden Feather Co. from maintaining a dam in the Feather river. The injunction was denied. When at the close of the season the Golden Feather Co. removed their dam, the case was disposed of in court last week, the plaintiffs awarded possession of the land, each party paying costs.

It is expected that in about two months the dredge at the Rio Bonito mines on the Feather river will be ready to launch.

Calaveras.

Good ore is being taken from the Lightner mine. The construction of a 20-stamp mill is assured.

The Ohio Co. is engaged taking out pay dirt.

After a wash-up of 300 carloads of gravel at the Lone Star, near Douglas Flat, the result was forty ounces.

Malespino, Williams & Co. will at once open up the Texas mine.

L. Grider of the Chilcoot mine, Douglas Flat, will at once sink a new shaft and put on an engine, 24 H. P.

Prospect: Action was commenced in court last week by R. Johnson against P. Tautphaus, F. Boeckman, E. F. Liebirch, C. W. Lynch, F. H. Hall and the Eclipse Gravel M. Co., involving the ownership of the Eclipse gravel mine, near Mokelumne Hill.

Chronicle: J. E. Burton at the Green Mountain mine took out a crystal last week 11 feet 7 inches in circumference, 4 feet 2 inches long, 3 feet 6 inches wide and 3 feet 2 inches high, that weighs over 2200 pounds.

Del Norte.

Record: The high tides of a few weeks ago wrecked the black sand works at Little River, doing great damage, and the company just below Crescent City suffered much loss. On Christmas day again the sea asserted domination over those portions of the land and put weeks of labor at naught.

El Dorado.

(Special Correspondence).—The transfer of the Zantgraf group of mines from the Chapman Bros. to the Cole Bros., of which this is the first publication, involves not only a present large amount of money, but promises an additional sum in the work projected.

Included in the purchase is the Montauk. Some work has been done on the latter, but extensive prospect work is to begin on it forthwith, to be followed by the erection of a 20-stamp mill, if warranted.

The 20-stamp mill in operation on the Zantgraf proper is practically new. In this they are breaking in on the 800-foot level, with ore enough on the 700-foot level for a year's reserve. The plant is lighted and operated by electricity, with a 75 H. P. engine in reserve.

The property will be known as the Montauk mine. The general management will be with Col. J. L. Cole, who, with his brother, Mr. D. H. Cole, are the purchasers. Col. Cole says they expect to expend $50,000 in addition to the purchase price, which was $200,000. The new firm took possession of the property Jan. 3d.

Placerville, Jan. 4th, '98.

(Special Correspondence).—Work on the Spreckels-Mulky mine, which has been in progress over a year, is nearing completion in tunnelling for the channel, which was tapped at 300 feet. The property is two miles above Fairplay. The gravel encountered is about 7 feet deep, and averages over $1 per cubic yard, in coarse gold.

Fairplay, Dec. 31st, '97.

(Special Correspondence).—The Boneset mine, upon which considerable development work has been done, has been bonded to Hayward & Lane. The property is fourteen miles west of Placerville.

The Rose Kimberly near Rescue, which has been idle for some time, will be reopened. It is under bond, I am credibly informed, to Hayward & Lane.

M. Varozza has sold 438 acres, known as the Try Again gravel mine, to San Francisco people. Fred W. Cook is Supt. Operations will be extensively carried on, both hydraulic and drift.

Alderson & Brown have bonded seven claims near the Larkin to Eastern people. W. H. Meyers has bonded two claims adjoining his Lloyd properties.

Placerville, Jan. 3, '98.

Kern.

At the Wedge mine they are taking out ore that runs $150 per ton.

The Little Butte has begun hoisting ore from the 300 level.

The Merced had twenty tons milled, which turned out $1200.

Madera.

(Special Correspondence).—Impetus has been given to the mining industries of this county during the past six months; and the next report from the mint will undoubtedly show a much greater output of gold from this locality than has been credited to it for many years. Improvement is particularly noticeable in the Fine Gold district, where numerous mines and prospects showing evidence of value have long remained idle for want of sufficient capital.

The Standard mine, owned by W. J. Henderson, is producing a large quantity of good ore. For several months past the ore has been reduced in a steam-power arrastra. A 2-stamp mill has been ordered in San Francisco, and will be set up on Fine Gold creek within a few weeks.

The Lily mine, now owned by an English syndicate, is now supplied with a 10-stamp mill, which has been kept running for the past six weeks on ore of fair grade already on the dump. Sinking has been resumed.

The Mud Springs or Wilson and Berry mine has been extracting ore of good quality from the 400-foot level. A mill with two concentrators has been kept steadily running upon this ore for the past six months, and the returns have been extremely gratifying to the owners.

The Keating mine, adjoining the Mud Springs, has been bonded to Hanshaw, Baker and Peters for $10,000. A 3-stamp mill, run by a 15 H. P. crude-oil engine, has been set up at the mine, and sinking from the 100-foot level is being vigorously prosecuted.

The Starbuck mine, on Fine Gold creek, near Gold postoffice, is showing a good vein of ore running upwards of $30 per ton. The ore is crushed in a 5-stamp mill, situated at the mine, and run by a 6 H. P. gasoline engine.

The old Taylor and Frazier, or Bonanza Queen, mine, now known as the Magnet, is being reopened by Messrs. Aram and Spargur. Some superficial work was done upon this vein ten years ago, and since that time no work has been done upon it until now. The vein shows every evidence of being a permanent fissure, and at several points along its course large bodies of good ore have been exposed. At the point where a shaft is now being sunk about 2 feet of ore is in sight, which will mill $15 per ton.

Gold, Jan. 3rd, '98.

The Ne Plus Ultra copper mine, between Berenda and Raymond, is reported sold to Stockton people; price, $15,000. The mine was closed down in '77 owing to the low price of copper and the high rates of freight demanded by the railroad company. In June, '96, the parties to the present purchase, under a contract, resumed work on the mine, and the results were so satisfactory that they have taken advantage of the option and will erect reduction works on the ground. The working of the mine will be pushed by the new owners.

Mariposa.

(Special Correspondence).—Philip Corcoran and E. C. Loftus have bonded the old Barrett ditch on the Merced river at Pleasant Valley with a view to installing an electric plant to furnish power to their mines in the Flyaway district and perhaps also to some outsiders. They expect to secure a head of about 100 feet at the power station.

The Merced Co. announces an almost total suspension of operations, to begin during the present week. Many of the miners have already been laid off, and the rest are cleaning up chutes and loose ore which will only occupy a day or two, and the mill will be closed during the present week. The reduction will affect about three-fourths of the present force, which now numbers about 100 men. A few men will be kept at the Mary Harrison mine, enlarging the present 170-foot vertical shaft from two compartments to three. On completion of this the shaft will probably be sunk about 300 feet more and some drifting will be done, but no more than twenty-five or thirty men will be employed on this work. The management is apparently tired of the clumsy policy heretofore pursued in stoping its ore at a depth of 200 feet below the bottom of the shaft, and will try and bring the development work at least abreast of the ore extraction. There is also under consideration the project of removing the 40-stamp mill from its present location on the west vein to a point near the Mary mine, thus obviating the expense of a four-mile haul from mine to mill. This distance is now made over the company's tramway at a cost of about 15 cents per ton, but owing to faulty construction the tram line has never given satisfaction, and it may now be abandoned.

Mariposa, Jan. 4th, '98.

Mt. Gaines, at Hornitos, is running full blast. They are working twenty-five men and the mine looks promising.

R. A. Parker of the London Improvement Co. visited the Virginia mine, near Coulterville, last week. The mill of the Virginia is nearing completion.

Nevada.

(Special Correspondence).—The Grizzly Ridge mine, at North Columbia, adjoining the Delhi on the north, at which work was recently renewed, is to be reopened at once. There are five claims in the group, and 185 feet of tunnel on a 6-foot ledge of fair grade ore.

North Columbia, Jan. 1st, '98.

The Alder Creek Co. owns, among others, a mine near Blue Canyon that has ore ready for the mill, yielding $7; the concentrates run $29 per ton. The company has a 3-stamp mill in operation, and will add twenty. Development work is pushed in three levels, and ore will soon be ready for the new mill. The mine is across the American river from the Pioneer. The cost of treatment is stated to be 71.2 cents per ton.

The shaft on the Reddick mine, one and one-half miles above Nevada City, is 500 feet and a drift on bedrock is 150 feet. The edge of the channel has been encountered and the gravel is good. The owners are mostly Grass Valley citizens.

The Supervisors appropriated $2000 for a mineral exhibit at the Golden Jubilee Fair.

Telegraph: Work in the Crown Point mine, Grass Valley, has been suspended temporarily.

Union: The Unity struck a new ledge of high-grade ore. A station is being cut at a depth of 350 feet.

Placer.

Glen mine, on Duncan canyon, is opening ground to breast in spring. This is one of the permanent and paying enterprises of eastern Placer.

The Blue Eyes, half mile from the Glen, is waiting for water. This has been hydraulicked for two years and paid from the grass roots.

The Bald Mountain gravel mine has been operating for several years. A party from San Francisco are operating with complete equipment for extensive work.

On the Flat Ravine quartz ledge, operated by Savage & Co., a tunnel is 600 feet on the ledge.

Collins & Morehead; Sellier, Murray & Larrabee, and Schippman & Ferrier, have made locations on which development work has been done with encouraging results.

Canada Hill mining district contains a number of promising claims. The Hobson & Payne Co. are running gangways and upraises preparatory to stoping.

The Gostlin & Worden gravel mine, idle for many years, has discovered the pay lead again and is working.

The Pioneer Supt. says the winze is down 34 feet; the vein is 6 feet wide at the bottom in ore that will mill $14 per ton, weather fine, water short, cold weather and ice having interfered with the water supply, running fifteen stamps slowly by day and faster by night. The company has twenty stamps and is considering a plan to dam the north fork of the American river about half a mile above the mill, thus securing a steady supply of water. Preliminary steps are being taken to this end, and the company has money to meet the expense.

Plumas.

Bulletin: Twenty men are employed at the Green Mountain mine, near Crescent Mills. It is reported that a large mill will be erected next spring. M. Wilkinson is Supt.

G. W. and C. Penman at Spring Garden opened the Alta placer mine on Greenhorn creek.

Russell & Waldren sold their quartz mine near Bucks Ranch to Van Leicht & Bergen of San Francisco. It is a large body of low-grade ore, about $6 per ton.

San Bernardino.

L. E. Aubury, from eastern San Bernardino county, reports a snowfall over an extended area. From Manvel to the edge of Death Valley from four to six inches of snow had fallen. The cold was extreme, and old-timers on the desert declare that such a blizzard had not visited that section in over twenty years.

At Dale City the mill owned by C. F. Baird is running day and night. In connection with this mill Mr. Baird has a cyanide plant with a capacity of ten to twenty tons a day. Gold bricks are shipped from Dale City every week. Mexicans working in the placers took out two nuggets recently, one a $40 nugget and one a $30 nugget. These same Mexicans took out $200 in less than a month last summer and have taken out nearly as much in two weeks this fall. Ferguson Bros. intend to put up a 10-stamp mill.

San Diego.

The Mountain View M. Co., Julian district, has returns from a mill run of over $100 per ton. The directors have let a contract to sink 100 feet, with a view to drifting along the vein.

J. R. Lowe has sold to R. Gardner for $2000 the City of Richmond gold mine near Julian.

The Cincinnati Belle gold mine at Julian has been attached in the suit of H. Crinklaw against the Banner M. Co., brought to recover $5000 claimed to be due for salary as superintendent.

Sierra.

The following gravel mines are in operation on Poker Flat: Scott, Bruckerman, Wolff, Winchester, Sullivan & Pearson, Jones & O'Donnell, Clark & Corbett, Klondike, Grasshopper, Hidden Treasure, Bunker Hill, Liberator, Orleans, Ballarat, Lost Streak. The following quartz claims are working: Alhambra, Copper Ledge, Pennsylvania, Straussner.

Sharkey & Payton have completed 50 feet of tunnel at the Keystone mine.

Messenger: The new mill at the Sierra Buttes is progressing. The Supt. hopes to have it crushing Feb. 1st. Work is also being done in the mine.

Shasta.

The Gold Hill, near French Gulch, is working steadily.

On the Morton placer mine at Fool's Gulch McCloud & Johnson have two shafts each 50 feet in good ore.

The mines in French Gulch, the Brunswick, Niagara, Milkmaid, Vogel and Reinhaus, are doing well.

The Clark Bros. mine is again in operation.

Miners of this county are complaining of a scarcity of water.

Siskiyou.

Phelps & Osmond are hydraulicking at Oak Bar.

Bonham & Linbcock commence work on the Siskiyou placer mine the 15th inst.

A Chinese Co. is working the Klamath river.

The Parker hydraulic mine on McKinney creek is doing well.

Lange & McCarthy have opened a 2-foot ledge on Barkhouse creek.

The *Advance* hears that between $5000 and $6000 was cleaned up by the last run at the Black Bear mine.

Journal: The third shaft of the Blue Gravel mine at Greenhorn will soon be down to the 100-foot bedrock level, when more men can be put at work in drifting and hoisting out gravel. By having three shafts a greater amount of pay gravel can be taken out than in running long drifts from one or two shafts, besides securing better air at the bedrock. As the gravel is taken out near the shafts, more new shafts will be sunk to get closer to the hoist, as the pump drains all the shafts equally in raising the entire bedrock water in the basin, which is used in connection with the surface water of the creek in washing the gravel dumped into the sluices. The claim is now said to be yielding handsomely, and this system of putting on a large force when water is abundant will enable the owner to get out big pay. Working the claim with a small force when water is scarce does not produce even proportionate results, as the same work is required in pumping and hoisting by steam as when a large force is employed.

The old Gold Ball mine at Salmon river has been started up, all the indebtedness and litigation having been settled. The new company in charge, with a wealthy Ohio syndicate as backer, intend opening the mine on an extensive scale, and have a large mill to do the crushing.

The King Solomon quartz mine, nine miles from the Gold Ball mine at Salmon river, will have a new mill in readiness for crushing by spring.

The Colorado men, who visited the Hegler mine on Humbug last week, have made a bargain for its purchase.

The quartz mill of the Dannenbrink Bros. at Know Nothing creek, Salmon river, is now kept running steadily on good paying ore. They have a 10-stamp mill operated by water power of 30 inches with 650 feet pressure.

Advocate: The Monarch mine on French creek has begun work on the 200 level. They have a 3-foot ledge.

At the King Solomon mine they began stoping from the 50-foot level.

The Manaha mine, near Etna, has begun operations under the supervision of W. C. Stanley.

Reporter: On the Allen mine D. Jones is taking out ore from the Pinkham, the Steel, Extension and Cosmopolitan mines in Quartz valley.

The tunnel on the Boomer mine is in 40 feet. The vein is 6 inches on the surface, from which 18 tons realized $35 per ton.

The ledge on the Sunshine varies from 6 to 18 inches. A crushing of 16 tons yielded $124.

D. Manning of Oro Fino has a vein 12 inches wide. A 200-foot tunnel taps the vein at 175 feet deep.

Journal: The Gold Ball Quartz mine at Salmon river, long in litigation, is in active operation under the supervision of S. P. Ball.

Tonkin & Sons are busy on the Fagundes mine. A tunnel is being run to tap the ledge.

The S. R. H. M. Co., on the Wm. Klein, are extending the ditch and flume 3 miles, to operate that claim with two giants under a pressure of 250 feet.

LaFlesh & Sons are running on quartz from the Lodi ledge near Henley, and are realizing good pay.

Hathaway Bros. at Oro Fino have a 5-foot vein from which they are taking good ore.

Trinity.

Work on the Bloss & McCleary mine has begun. The ditches, flumes and pipes will be enlarged and the property operated on a large scale.

At the Trophy mine, on the Trinity-Humboldt line, a giant is operated under a pressure of 250 feet.

Amos Hill of Coffee creek has sold the Yellow Rose of Texas quartz mine to J. and I. Rider of Napa for $2500.

Tulare.

The Golden Copper King, owned by Biggs & Waite of Fresno, is 100 feet wide and assays nineteen ounces in silver and $21 in gold to the ton, and 20 per cent copper. It has a shaft 45 feet and a tunnel 50 feet.

Tuolumne.

Capt. W. H. McClintock, Supt. of the Rhode Island and Philadelphia mines, makes the following computation on the gold output of Tuolumne county mines for 1897: Norwegian, $75,000; Jackass Hill, $50,000; Rawhide, $500,000; Little Gem, $5000; Dutch, $200,000; App, $50,000; Santa Ysabel, $25,000; Jumper, $240,000; Eagle-Shawmut, $30,000; Dondero, $15,000; Bald Mt. and Brown's Flat, $50,000; Golden Gate, $215,000; Star, $24,000; Keltz, $30,000; Belleview, $30,000; Black Oak,

Work has begun at the Spring Gulch mine.

The Tarantula started up the new machinery this week.

The Rappahannock will sink to the 1000-foot level.

Good ore is being taken out at the Grizzly mine, near Summersville.

C. Ross & Co. will put up a custom mill near the Mascot mine.

At the Yellow Jacket, at Arrastraville,

some of the rock goes as high as $200, while the average is over $50 per ton.

The Woods Creek mine at Yankee Hill has closed down for the winter.

M. Breckon has leased part of the Hudson & Calhoun mine at Saw Mill Flat.

At the Over mine on Bald mountain the shaft is down 65 feet.

On the Haskell placer mine work is being done at the depth of 80 feet.

Gould & Doyle are opening a property at Horseshoe Bend, on the north side of the Stanislaus river.

Stover & Shorey are developing a property on Doyle's ranch.

$150,000; Confidence, $25,000; Dead Horse, $75,000; Lady Washington, $20,000; total, $1,809,000. Number of stamps in operation, ninety-three.

The Pirate mine, at Sugar Pine, has been sold. The purchasers are running a tunnel.

One-fifth of the Blue Star mine, at Summersville, has been sold to J. W. Reddish.

Yuba.

Thurston Bros. at Mount Hope have their mill nearly finished and have quartz ready to start it.

At the Independence mine the crushing is ten tons every twenty-four hours and the return is $8 a ton.

NEVADA.

Tribune: Up to two years ago, when the present management took hold of the Dexter at Tuscarora, it had in past years been productive of $182,000 in dividends. Since that time shipments of bullion, cyanides and crude ore have gone to Salt Lake, 55 per cent of the owners being Salt Lake people. During the year the company have spent $100,000 for a mill and improvements, which it will cost the company to carry out their plans. The company is now building a 40-stamp mill, which will be completed by Feb. 1st, and an electric power plant with a ten-mile pole line from Niagara creek, on Chagnon ranch, to furnish power and light for the mine and mill. During the fall of '97 the company erected a cyanide mill of ten tanks of fifteen to twenty tons each, or a daily capacity of fifty to sixty tons, and which will work the tailings. The ore is free milling. The country rock, it is said, goes from $2 to $8 a ton. Forty men are employed in the mine, J. Hickey, Supt.; two shifts are run. The mine is fifty-two miles north of Elko, in Tuscarora mining district, and is a $3 a day camp.

A large deposit of medium grade ore in the Yuba of the Pioche Con. Co.'s group has been opened, and a discovery is said to have been made of a method of treatment by which nearly all its value can be extracted. The ore will average 20 per cent lead and carries from $7 to $15 per ton in gold. Little of it can be sorted down close enough to pay for shipment, but by concentrating, then leaching the residue, a very close extraction is obtained. The process is one which the Godbe boys have been experimenting with for two years past, and the works here are the first in which it has been used on anything of a large scale. The Half Moon group of the Pioche Con. Co., the Old Timer group and Schofield's all carry gold in sufficient quantities to make them paying properties under the new method of reduction.

The State Line M. Co.'s mill is completed. One hundred men are at work in the camp.

W. Jewell is running a 50-foot tunnel on the Security claim.

The Boston-Nevada Copper M. Co. at Yerington is showing up a new body of ore. They have completed two tunnels 320 and 290 feet and are drifting on the main ledge.

The tunnel on the copper claim of Young Bros. at Mason Station has reached 30 feet. Surface samples show good ore.

Virginia *Chronicle*: The Scotch company which contemplated the working of the Comstock waste dumps has laid off the men who were working the Ophir waste dump and discontinued the operations there. It is understood that the scheme they had in hand has been abandoned. The test run of Ophir waste, made at the Kinkead mill, is said to have proved unsatisfactoy.

The nickel works at Cottonwood are at last a success and the metal is now being successfully produced in commercial quantities.

The antimony property, near Mill City, was bonded to a Chicago company for a year. The figure is said to be $10,000. M. Sohr will commence operations at once. The company will put in a concentrating plant.

OREGON.

The Big Four hydraulic mine on Pickett creek, at Grants Pass, is kept busy day and night.

J. W. Sherer last week, on Rogue river, brought thirty ounces of gold to Grants Pass from a twelve days run.

C. W. Bursdsal, near Oro Fino, has struck a 2-foot vein of high-grade ore.

Much development work is being done on quartz and placer mines in Douglas county.

The Miller ledge, Josephine county, in its first six weeks run cleaned up $60,000. The owners are Eureka, Cal., people who paid $28,000 cash for the property. The vein is 18 feet wide.

Browning & Hannum got $1540 from eleven tons of ore on Grave creek, in Josephine county.

W. H. Reid is running a drift in the Hammersley mine that is turning out $75 ore. The ledge is 2½ feet.

Portland and Eastern people will construct a smelting and copper refining plant. Among those dentified with the enterprise is Samuel Barron. The proposal is to erect a 400-ton plant.

The Denny group, near Baker City, consisting of five claims, were sold to W. R. McCormick for $12,000. The purchaser has started a 6000-foot tunnel to tap the ledge at 2500 feet depth.

Goucher & Co. of Portland, on the Oliman Reece, near Grants Pass, have their No. 2 giant at work. The ground is said to be rich.

F. Huston, on Althouse creek, is ground sluicing a porphyry dyke, getting nuggets from $35 to $75.

C. Bennett, on the Marshall placer, is running two giants on a 10-foot bank.

R. C. McIntosh is running three giants day and night near Grants Pass.

H. D. Sluter is operating his placer on upper Wolf creek.

WASHINGTON.

The tunnel on the Paris, opposite Bossburg, is in about 80 feet and the character of the ores is improving. The Young America mine, in Bossburg district, has resumed operations under the management of J. Hanley.

BRITISH COLUMBIA.

J. M. Burke, Mgr. Slocan Silver-Lead Syndicate, Fort Steele district, made the final payment on the property. It sold for $40,000.

Returns from a shipment from the Alberta, Slocan, went $116 in gold and silver to the ton.

The smelter at Northport will commence operations about Jan. 10th.

News from Camp McKinney reports a strike in the Minnehaha. At a depth of 120 feet a 4-foot vein averages $50 in gold.

The Athabasca, near Nelson, made a shipment last week of twenty-five tons.

The Big Bump, near Craigtown, has been sold to R. K. Neil for $5000.

The Silver Island claim at Nelson has been purchased by W. C. Forrester.

The sale is reported of 500,000 shares of the Good Hope mine at Rossland to an English corporation at 3½ cents per share. The property adjoins the Good Friday on the north.

Transmission of power to Rossland by the West Kootenay Electric Light & Power Co. from Bennington Falls is promised Feb. 1st.

ALASKA.

The Alaska-Treadwell Mining Co. of San Francisco and Douglass Island have bought 5,000,000 feet of lumber for the two new stamp mills on the famous Treadwell mine. The amount of lumber required for immediate delivery is about 2,000,000 feet. Of this there will be 1,600,000 feet of dressed lumber. The balance will be heavy timbers running 18x24 inches, 33 feet long. The heavy timbers will be framed at the yards of the sawmill by workmen engaged by the Alaska-Treadwell M. Co. The lumber will be shipped to Douglass Island, beginning February 1st.

At Berners Bay the discovery was recently made of free gold quartz in the Bear mine. The ledge is 4 feet wide; the extent of it is not yet determined.

In the Bald Eagle at Sumdum 20,000 tons of good ore has been opened up. The upraise is 250 feet long and the ore body 6 feet wide. The mill started December 20th.

Juneau *Record*: The Black Maria, the oldest quartz mine on the Alaskan coast, was sold last week by D. Willoughby to the Thomas Investment Company, of Seattle, for $100,000. The Black Maria was located twenty years ago. It is a group of eight claims. About 9000 feet above the sea level, a tunnel runs in 160 feet on a ledge over 30 feet wide. A shaft has been sunk 9000 feet below the tunnel, to a point 27 feet below the salt water level. The ore in the shaft runs from $27 to $50 a ton, but as it is concentrating ore, expensive machinery is necessary for its development.

The December bullion product of the Alaska-Treadwell mine was $45,396, from 19,082 tons ore and 375 tons sulphurets, the latter yielding $16,212. The ore averages $2.37 per ton. The company will put up a new 300-stamp mill. It already has one of 240 stamps, the largest quartz mill under one roof in the United States. It is also proposed to introduce electric power from a distance, so that there may be no interruption to work in the winter season.

N. S. Trowbridge, Supt. of the Bald Eagle M. Co., Sum Dum, Alaska, is down from that mine, sojourning in San Francisco, and proposes to put on additional stamps. The Bald Eagle is a good example of an Alaska quartz mine successfully worked. There has been no attempt to make much fuss over it, but considerable money has been spent with satisfactory results. An 1800-foot tunnel, which cost $26,000, has been built and sufficient ore extracted to pay for it and other development work. This ore has been pounded up in a little 4-stamp mill, which, by the way, has an average record of twenty tons of dry ore daily, an unusual feat. The ore runs about $28 per ton and is treated at an average cost of $5. About 50 per cent is saved on the plates, the concentrates, which run as high as $400 per ton, being shipped to this city. Sum Dum is fifty-seven miles southeast from Juneau, and the mine of which Mr. Trowbridge is superintendent is almost at the water's edge. It is the intention to have twenty stamps in operation this year.

THE KLONDIKE.

Transcontinental railroads estimate that 250,000 people will attempt the journey to the Klondike in 1898. It is not deemed possible for all the transportation companies in Alaska to deliver anything like that number in Dawson during '98.

An interesting point in connection with the question of age of Klondike gold is that the ground remains perennially frozen, only the surface being thawed in summer to the depth of two or three feet. It would appear, therefore, that, like the placers of Siberia, these deposits have remained undisturbed and unaltered ever since the glacial period, and perhaps some such evidence of this will in course of time be discovered as was afforded by the remains of mammoths and other animals in the Siberian frozen mud. It is worthy of note that the comparative lowness of standard of the gold is, under the existing conditions, in favor of the view that the placer gold is derived from the erosion of auriferous quartz lodes formerly existing at a higher level, and has not been formed in situ by being deposited from solution. For, according to those who support the former view, placer gold becomes of higher standard than quartz gold after it has found its way into drifts, removed by solvent action of water, in which gold is not readily soluble. Since, however, the Klondike gold has been frozen up during a large part of the time since it was deposited in the gravel, it is obvious that it cannot have altered in composition so much as the gold in river sands further south, and might be expected to resemble the gold in the parent lodes, which is not usually more than 800 fine. The low standard of the gold is not so readily accounted for by the accretion theory of formation of placer gold.

Under date of Nov. 28, '97, John D. McGillivray writes from Dawson City: "The first dog teams are beginning to start, and many large parties are preparing to take the trail during the next few weeks. Many of these go well equipped. All the best dogs are being picked out and command fancy prices. Robes which sold last year at St. Michael for $3 are now worth $300 or more. At least 300 men will have left Dawson before Jan. 1. A large portion of these are men who lately came in and have left in disgust after selling their outfits. A number are going out with the intention of returning in the spring with supplies, which they believe will command high prices, and many are going out to offer good things to a confiding public. The people of the United States will be offered opportunities to invest in a large proportion of the mines of the Klondike district in a few weeks. Some of them going out are taking papers for good properties, but, besides these, all sorts of old-fashioned swindles are being concerted.

"The wage question is at last about settled for the winter. Miners are going to work practically upon the terms of the mine owners. A few experienced drifters are receiving $1.50 per hour, and on some rich claims in Eldorado creek $1.25 will be the rate, but a large majority of the men working for wages have agreed to accept $1 per hour. Owing to the strike, much valuable time was lost—enough to make a difference in the winter's output of from $1,000,000 to $2,000,000. Next summer there will be much less done for labor when drift mining is over for the year than at present, and those who are coming in next spring and summer should bear in mind that opportunities for obtaining employment before next winter will be very few. It is probable that many miners will leave here for the old districts or newly discovered creeks on the American side as soon as navigation is open on the Yukon and supplies begin to come in next May and June. It is probable that unless the better class of people at Fort Hamlin and Munook lay strong hands this winter upon the bad element which has gone down the river from points above, there will be considerable lawlessness. There is barely enough food to keep alive those who are on the river at or below Fort Yukon, if it is properly divided and husbanded. Among the last to leave Dawson for these points before the river was closed to the boats were a number of men who had lately arrived here, sold their outfits, and went down with the expressed intention of obtaining food from the trading companies' stores without paying for it. Of all who went down, but a trifling number were without money with which to buy sufficient supplies, but many who were well supplied with means announced their intention to insist that they should be fed free of charge. Besides these, there was quite a number of men averse to work if a living could be obtained without it—a class that is new to the Yukon country. Besides these, a number of thieves, who had committed depredations here or further up on the river and on the trails, have gone on down to avoid detection. A large majority, of course, of those who will winter down the river is of a very good class of men, and they may be able to control. Captain Ray of the United States army has his headquarters at Fort Yukon, and may be of use in case of trouble.

"It is claimed by the trading companies that there is plenty of food at these points, but they have probably underestimated the number of people to be supplied. There should be nearer 3000 than 2000 people in the Yukon country below Forty Mile.

"The Bella, owned by the Alaska Commercial Co., left here early in October with 150 passengers, including a number of women and children, all of them having been supplied with food enough to last them to Fort Yukon. She was delayed for several days at Forty Creek, which is next to Circle City, about the largest town in the Yukon last year, but which was practically destroyed at the beginning of the Klondike excitement.

"There are several hundred cabins, in nearly every one of which are articles of value, which were regarded by their owners as perfectly safe, and which would have been but for the incoming of so many dishonest people. The thieving passengers of the Bella looted nearly all of those cabins, carrying aboard the steamer everything movable they could find.

"Word now comes from Circle City that the miners had determined to allow no one coming down the river to stop at that place unless fully equipped for the winter. There is no government on the American side in all the Yukon country from the 141st parallel to the mouth of the river, a distance of nearly 2000 miles. There is one collector of customs at Circle City to see that bonded goods cross the line and the trading companies' whisky is not interfered with. There was located also a commissioner of some sort at Circle City when I passed through there in September, but he had received no instructions as to what his duties were. There came up here two months ago another commissioner and a Deputy United States Marshal, who were to establish their headquarters at Circle City. They are now both located on the British side of the line in Dawson, engaged in obtaining mining locations to take to the States for sale. There is need for immediate action by Congress toward establishing a strong government in the Yukon country."

CANADA.

The detailed report of the Geological Survey upon statistics of mines and minerals for the year '96 has been issued. It gives Canada's total mineral production for the year as $22,500,000, an increase of 125 per cent in ten years, the production in '96 having been $10,000,000. In the production of gold British Columbia is credited with over 64 per cent and Nova Scotia with over 18 per cent. The Northwest Territories, including the Yukon district, came third with 13 per cent, Ontario fourth with 5 per cent.

UTAH.

Tribune: The Germania Smelting Co. has started a reverberatory furnace of 100 tons daily capacity, and has sufficient copper ore in stock to insure a long run. In addition to the 3000 tons of old Copperopolis ore, there are accumulated shipments from the Ajax, over 1000 tons from the Highland Boy, and that from the Mingo and Hanauer. The run promises to be the most eventful in the history of valley smelting.

The search for gold on the Cannon group, at Mercur, is to be renewed on a bond obtained last week by C. H. Scheu and associates. The figure is understood to be $200,000. Work begins at once.

A carload of high-grade silver and lead ore from the Yuba, at Pioche, was sold last week in Salt Lake City.

The Crystal M. Co., at Marysvale, reported last week with fifteen tons of concentrates, to be followed by another this week.

The Chloride Point, at Mercur, shipped two cars of good ore last week.

The Northern Light, at Mercur, is running on high-grade ore.

The Grand Central, of Tintic, is now turning out copper which yields 15 per cent copper and $5 in gold. The shipment of this class of ore is the first made from the Grand Central.

The Conger mine, Bingham, is a new shipper; the ore runs 22 per cent copper, 29 per cent iron, 8 to 17 ounces silver, and high in gold.

IDAHO.

Manly & Klockman have secured a controlling interest in the Continental mine, near Bonner's Ferry, and are pushing work. They are down 65 feet on the ledge. They will erect a concentrator.

Development work in the Golden Chest, at Murray, has shown a new body of ore, which insures keeping the mill busy for four months.

The Daddy mill has started after being closed down two weeks.

G. Smith, Pine creek, bonded a group to C. Beisel for $15,000. Mr. Beisel is proceeding with development.

Chicago parties have purchased a controlling interest in two claims at Pierce City, and will develop them.

A clean-up of the Crescent, after eleven days' run, 5-stamp mill, produced 234 ounces of gold.

The superintendent of the Boise assay office estimates that the increase over 1896 is 25 per cent. Figuring on that basis, the total output for the year would not be far from $14,700,000. A comparative statement is:

	Actual Output, 1896.	*Estimated Output, 1897.*
Gold	$ 2,323,700	$ 2,924,625
Silver	6,474,765	8,093,456
Lead	2,953,280	3,692,840
Totals	$11,751,845	$14,710,921

Some estimates place the gold output higher than that given here, but these fail to take into consideration the immense amount of work done on gold ledges with comparatively no output. For example, the Florida Mountain M. Co. at Dewey has expended in the neighborhood of $500,000 without having taken out enough gold to satisfy the payroll for three weeks; and some confuse this development work with output. The figures herein given will not, it is believed, miss the output far.

In the northern part of the State there has been great activity in the silver-lead mines, the output being materially increased. These mines carry a large percentage of lead and can, therefore, operate even under the low price of silver. Other silver-lead mines in the southern part of the State have been unable to continue, however, and their closing down has materially cut down the percentage of increase, measured by the immense northern output.

In the southern part of the State attention has been given exclusively to gold mining, and the developments have unquestionably been the most extensive and important that have been crowded into any one year in the history of the State. In the Silver City district the old mines have maintained their record, some making flattering increases in output, and a number of new properties have been opened by outside capitalists, who have the greatest faith in the camp. The Trade Dollar this year has paid in the neighborhood of $450,000 in dividends out of a total output of about $575,000. The Trade Dollar expended $75,000 during the year for adjoining claims.

The De Lamar mine has not come up to its old-time output, finding it needed a new process to handle its ore. During the year it installed a new process.

In Boise basin many thousands of dollars have been invested in placer and quartz mines by Colorado, Pittsburg and Boston people. The placers will be worked with dredges, initial operations having just commenced.

Tribune: At Burke the Poorman and Tiger mines have been in continuous operation, and as the main working shaft deepens and levels are run from it, the ore bodies are found to improve. The output is about 2000 tons per month, the ore carrying 65 per cent lead and 30 ounces silver. From 150 to 200 men are employed. West of Burke is the Standard

mine, the product being 2000 to 3000 tons of concentrated ore per month, which yields from 60 to 80 ounces silver and 60 to 65 per cent lead. One hundred men forms about the usual working force. West of the Standard is the Mammoth and upon the same lead with the grade of ore and indications are that at equal depth it will become as valuable. At present the Mammoth is worked through the upper Standard tunnels. The output is about 500 tons monthly and from forty to fifty men are employed. At Mullan the Morning mine has been a success. The output of the two mines ranges fully 3000 tons per month. The Morning mine yields 15 to 20 ounces silver and 60 per cent lead. The Hunter has been producing about 500 tons of ore per month and employing fifty men. The concentrator was burned last August. A new mill, having improved machinery, will be erected in the spring. The Kansas City Smelting and Refining Co. has bonded a group of nineteen claims situated between the mines at Burke and the Morning mine at Mullan. On the north side the gold product has not varied much in recent years, being about $500,000, much the larger proportion of which come from quartz mines. The secret of success of all the properties, notably the Golden Chart, Idaho, Mother Lode, Daddy, Jenkins and Mastla, has been the ability to concentrate the tailings from the mills and save the sulphurets and kindred forms of gold. The average value of the concentrates is from $80 to $100 per ton.

MONTANA.

The Sunnyside mine at Meadow creek, under the management of G. H. Savage, shows work well under way. A good lead can be traced along the mountain for several hundred feet.

At the Alice mine, Walkerville, everything is progressing. The output of the company and ores that are sent in by neighboring mines is keeping the big mill in steady operation. The company's property has been productive of dividends amounting to $1,075,000, of which amount $80,000 has been paid this year.

At the Great Northern mine near Libby there is an unlimited quantity of galena ore ready for shipment. At the Selkirk claim they have encountered a body of copper ore running as high as 140 ounces in silver and carrying gold values.

The Ontario will have paid $202,500 this year.

W. E. Heki again pierced the Junebug vein and disclosed 6 feet of free milling ore of good value.

Tunneling into the Ontario mine will be accomplished by day's labor under the direction of the officers of the company instead of contract work. The vein is to be opened 500 feet below the surface, and the workings already opened are to be extended 300 feet.

The town of Dillon has shipped 100 tons of ore since Dec. 15th.

The gold output of Montana in 1897 is estimated at $4,500,000; silver output, coinage value, $21,000,000.

SOUTH DAKOTA.

Costello at Greenmont has a body of ore which assays $30.

The C. G. M. Co. of New York have decided to erect a smelter in the Hills in spring. The plant will have a capacity of 150 tons daily. H. Franklin of Deadwood will have charge of construction.

COLORADO.

The Commodore Co. at Creede have increased their output to 125 tons a day.

The Nelson tunnel, near Creede, is 4000 feet and making good headway.

Carver & Miller's shipments in the Amethyst at Creede this month will exceed that of any one for the last six months.

The Hanington at Amethyst continues to to ship 100 tons a day.

Gilpin county shows great gain in the production of gold for 1897.

Several large sales have also been made during the year of producing properties, among the list being the First Centennial for $127,500, the Topeka for $160,000, the Cook for $140,000, the Queen of the West for $20,000.

The shipments of mineral from Black Hawk station, commencing with December, '96, and ending with November, '97, were 3757 carloads—a gain of 914 carloads.

During the year the banks of Central City shipped gold to the amount of $727,000, showing a gain of $542,751.

The Idaho G. M. Co.'s property at Blue lakes has been purchased by a Montana company for $25,000. The new company has commenced work. Four giants will be used with a pressure of eighty pounds to the inch.

The Crown Point-Virginia mine at Idaho Springs is reported sold to Eastern capitalists for $150,000.

C. J. Moore has taken a bond on the Bird's Nest property at Eldora for $30,000.

M. D. Morrison has leased his Anaconda property to the Mayhem Investment Co.

The Virginia mine at Leadville is shipping twenty-five tons a day. The value is principally gold, silver and lead.

The first shipment of the Santa Rita main shaft, Cripple Creek, was made last week, consisting of ten tons.

The Fluorine is making daily shipments of from fifty to seventy-five tons of $25 to $30 ore.

The Magenta at Granite is down 260 feet and the George 190 feet. Fifteen stamps are crushing one ton to the stamp every twenty-four hours.

Pay ore has been struck in the lower workings of the Tom Boy at Telluride.

The Ibex Mining Co. at Leadville maintains an output approximating 400 tons per day.

Operations have been resumed on the Little Vinnie, Leadville.

The Mount Albert M. T. and P. Co. is driving a tunnel near Leadville. The bore is in 300 feet and has cut several veins showing bigh returns in gold. B. S. Phillips is conducting operations.

Cash & Harker are shipping large quantities of iron from the Jason at Leadville.

The production of the smelters of the Consolidated Kansas City Smelting and Refining Co. is given as follows:

The product of the works at Leadville, the Arkansas Valley Smelting Co., for the year 1897, amounts to:

	Ounces.
Silver	3,505,497.92
Gold	88,136.556
	Tons.
Lead	16,955
Copper	1,202

The derivation of this material was:

	—Ounces.—		—Tons.—	
	Silver.	*Gold.*	*Lead.*	*Cop'r.*
Colorado	3,064,602.63	87,947.311	7,990	1,192
Utah	55,187.07	181,792	157	10
Idaho	383,896 3s	.....	8,800	....
Colorado smelters	1,810.87	7,453	7	344

The '97 product of the Argentine plant (estimating the month of December) is:

Silver	11,408,623 ounces
Gold	227,991 ounces
Lead	45,033 tons
Blue vitriol	1,438,310 pounds
Litharge	2,553,861 pounds

The metals at Argentine derived from Colorado ores amounted to:

Silver	28,048.14 ounces
Gold	5,602,634 ounces
Lead	16,154 pounds
Copper	18 570 pounds

The State Bureau of Mines furnishes the following lists of men employed in the mines of Colorado, according to the various counties:

County—		*County—*	
Arapahoe	1,583	Lake	3,519
Archuleta	76	La Plata	544
Boulder	1,653	Larimer	147
Chaffee	707	Las Animas	26
Clear Creek	1,719	Mineral	495
Conejos	46	Montezuma	52
Costilla	28	Ouray	1,185
Custer	318	Park	467
Dolores	354	Pitkin	1,242
Douglas	77	Pueblo	1,685
Eagle	182	Rio Blanco	32
El Paso	5,386	Rio Grande	194
Fremont	384	Routt	247
Garfield	27	Saguache	264
Gilpin	2,473	San Juan	996
Grand	48	San Miguel	1,285
Gunnison	787	Summit	426
Hinsdale	493		
Huerfano	26	Total	29,219
Jefferson	45		

The above represents the average number of men engaged in mining in the various counties during the year 1897. It does not include the employes in the general offices, corporations, mining and consulting engineers, United States deputy surveyors, mining brokers and promoters, or those owning and operating properties, but giving their time to other vocations.

The following is a brief of the accidents and other causes, investigated by the Bureau of mines, for twelve months ending November 30, 1897:

Cause of Accidents—	*Fatal.*	*Non-fatal.*
Fall of earth and rock	23	43
Accidental discharge of blasting compounds	40	56
Material falling down shaft	9	9
Other shaft accidents	19	11
Persons falling down unprotected shafts, winzes and passes	9	5
Ladder accidents	1	8
Machinery accidents	1	11
Falls from staging	..	6
Accidents from other causes	8	20
Totals	110	169

The gold output of Colorado in 1897 is estimated from figures furnished by the smelters, mills and mint at $22,500,000, an increase of $6,000,000 over that of 1896. The silver produced was worth $12,807,076, lead $2,741,672, copper $1,209,053.

A company of Rico and Colorado Springs people is working the placer bars on the Dolores river on an extensive scale.

There are over eight miles of workings on the Newman group, Dolores Co., and vast territory remaining to prospect. Last week a good sized body of ore was encountered in new ground that returned 3½ ounces gold and 217 ounces silver per ton.

The Black Hawk M. Co. of Rico shipped eighty-eight cars of ore last year.

The Pay Roll mine at Rico has a vein carrying two and one-half ounces gold per ton and some lead ore.

The Victor-Golden Cycle pay roll at the mines was $45,000 for December.

The Blue Bird will output 200 tons this month. The larger part of the ore is valued at $30 per ton.

The Crawford had a two-carload shipment this week of $30 ore.

A shipment of twenty-three sacks of ore from the Granite at Cripple Creek was valued at $5000.

The Myers made its first shipment last week; it gave returns of $50 per ton.

The Six Points at Cripple Creek broke into a 4-foot ore body. A trial shipment made returned $142 per ton.

Ten inches of ore valued at from $400 to $600 per ton was uncovered in the Home Run mine last week at Cripple Creek.

MICHIGAN.

At Lake Superior it is expected that the Wolverine should earn $125,000 in '98, or $2 a share. The surplus of the Calumet & Hecla is but little short of $10,000,000 at present, although $5,000,000 was paid in dividends in '97, including the one paid Jan. 1, '98. The Tamarack mill is now turning out from 1350 to 1400 tons of mineral per month, which will average 71 per cent refined copper, nearly 2,000,000 pounds of copper monthly, as against two-thirds of that amount last year, and is earning, according to good authority, $11 per share. Dividends of $6 were paid in '97.

NEW MEXICO.

About forty-five miles southeast of Taos A. W. Tennant has six parallel veins two miles long in a width of 500 feet. The vein is 4½ feet wide at a depth of 340 feet. The ore runs 55 to 90 per cent copper. Hoisting works, pump, matte smelter and other improvements are to equip the property as soon as possible.

W. J. Cartan of the Cochiti G. M. Co. has closed negotiations for the purchase of the No Name group at Bland, and $10,000 will be spent in development at once.

The Blakslee tunnel at Elizabethtown is being equipped with air compressors and work will be pushed. The company will put in a concentrating plant. The tunnel is in 600 feet. When completed it will measure 4000 feet and give a depth of 2000 feet. It has followed a 4-foot vein the entire distance, the values of which range from $20 to $80 per ton.

A strike was made last week on the Zorn & Masterman, Elizabethtown, an inch streak in the vein showing quantities of free gold and giving returns of $5 per pound. Mgr. Gavin asserts that a plant for treating the product will be erected.

G. Young is taking out ore in Grant Co. which runs 18 per cent copper, $4 gold and six ounces silver per ton.

Brockman & Hughes, on the Hanover No. 2, have a body of 16 per cent copper ore.

Davidson & Bell, on the Golden Giant, near Silver City, have sunk 450 feet. There is a vein of gold ore in the shaft from the surface to the bottom.

On the old Hanover mine there is said to be more than 5000 tons of ore exposed, ready for stoping.

The Graphic, at Hadley, is to be reopened. J. L. Doran has taken a lease on the property for a year.

D. Wood has commenced work on the Eagle mine in Gold Hill.

The ore vein in the Western Belle is 14 inches wide and assays from $40 to $70 gold per ton.

The main adit level on the Confidence mine, in Grant Co., has attained 1600 feet, with a depth of 500 feet. Over 100 tons of ore per day is being shipped.

The old Spanish workings upon the Romero mine, near Silverton, recently reopened, were found in a perfect state of preservation after the lapse of nearly a century. There are hundreds of feet of drifts and crosscuts in solid rock, in the excavation of which not an ounce of powder was used, not a sign of a drill hole to be found in all the openings. The rock was broken by the primitive method of building fires against it and when at a red heat water was thrown upon it causing the rock to crack and disintegate. The expansion of the rock adjacent under the influence of heat caused it to loosen so that it could be extracted with picks and gads. These drifts are large—being about 8 feet square. In many places in these old workings good strata of pure nugget copper are exposed and a considerable area is thus explored and proven of value to work at a good profit with present improved facilities for working copper ores. The Guadaloupe continues to produce quantities of tenorite and melaconite.

ARIZONA.

On the Eureka, in the Globe district, the shaft is 300 feet deep, all the way in ore assaying fifteen ounces in silver.

The Pinto Creek M. & S. Co., at Pinto, is producing 47 per cent copper and $24 gold.

The Gypsie Queen, near Globe, shows 7 feet of ore carrying silver, lead and some gold.

Among a party of Eastern men expected in Jerome soon to see the working of that copper camp are C. M. Depew, J. N. Beckley, president of the Toronto, Hamilton & Buffalo Railway, of Rochester, N. Y.; E. Van Etten, general superintendent of the New York Central & Hudson River Railway, of New York City, and C. M. Warner of Syracuse, N. Y.

V. H. Igo has bonded the group of mines in the Huachucas for $10,000, stipulating the immediate commencement of work.

The Table Mountain Copper Co., at the new town of Klondyke, have 108 men at work. A smelter will be put up at once.

At the Norma mine, White Hills, a 3-foot ore body has been encountered on the 400-foot level, a car sample of which gave 2600 ounces of silver and over one ounce of gold per ton. The shaft is 30 feet in the ore body.

At the Independence, at Union Pass, the cross-cut tunnel is in ore which is said to run $100 to the ton. The ore body stands 200 feet above the ground, and is quarried. A mill of not less than 100 tons daily capacity will be erected immediately.

A 10-stamp mill is in operation on the Perris mine, near Congress. The Perris produces some high-grade ore.

The Nellis group of mines, Coconino county, has been purchased by Lombard, Goode & Co., of Chicago.

The shaft at the King of Arizona is 125 feet, and high-grade ore is being taken out.

A third interest in the Southern Cross was transferred to T. W. Briggs, who is developing the property.

The present work on the J. S. H., in Peralta canyon, is being done on ore of high grade.

On the Socorro, nine miles north of the Harqua Halas, the ore averages $9 in gold. The shaft is down 200 feet.

Eight miles south of the King of Arizona, assays from an area of several hundred feet square resulted in $20 to $40 per ton.

The Jerome Copper Co., developing properties adjacent to the United Verde, has struck a large body of copper ore. They expect to have a smelter in operation within the next six months.

T. Hamilton has given a bond on his property near Peeples Valley for $30,000. The ore in his main shaft runs $75 in gold.

A large body of ore has been struck in the Olden, near Phœnix.

T. Newland has given a bond for $20,000 on the North Star mine, Weaver district.

Denver *Republican*: Mining has been active during the year, mainly with gold properties. The product will be above the figures of last year. The Congress has increased its yield through richer ores secured at lower levels and through the operation of a cyanide plant. The United Verde, Clark's mine at Jerome, doubled its reducing capacity during '97, and its ores, commonly known as copper, carry large percentages of gold and silver. The pyritic districts immediately south of Prescott have about doubled their gold product of '96. In the south the Fortuna mine, near Yuma, has produced a third of a million. Its neighbor, King of Arizona, has had a product of about half as much in the few months of its existence. The Pearce mine, near Tombstone, has entered the ranks of heavy producers during the year, though its mill is not yet in operation, and its rich ores have been sent to El Paso for reduction. South of Tucson, in some of the oldest districts of Arizona, rich mines are being opened up on new ground. A considerable quantity of gold has come from the operation of a dozen or more large cyanide plants installed beside the dumps of the Vulture and other mines that were once great, and several hundred thousand dollars have come in through the placer operations on the Hassayampa and other gulches in southern Yavapai county.

Silver mining has declined until it is little more than a by-product. In Mohave county, however, reduction works are going into the silver belt about the White Hills. Hardly a silver mine has been worked during the year. The owners of the Reymert property, in Pinal county, express the general opinion when they state their inability to produce silver at a less price than 80 cents per ounce.

Copper production during the year has hardly held its own. The product of the Jerome smelter is in excess of '96, but no other copper furnace is running at present in northern Arizona. In the south the Bisbee Co., newly equipped with modern converters, is turning out an increased amount of high-grade black copper. At Clifton the Arizona Copper Co., from rich mines at the Morenci and Metcalf hills, has somewhat bettered its product of the previous year, but at Morenci the Detroit smelters have been shut down for half the year, pending improvements being made by the Bisbee Co., which recently assumed ownership through purchase from William Church of Denver. Globe, usually good for 20,000,000 pounds, shows not a pound for 1897. The furnaces closed down about the New Year past to await the advent of the railroad that stopped at Geronimo. But the bins at the Old Dominion and Globe Mines companies smelters are piled high with coke and the dumps are heaped with high value copper ore. New wire tramways have been put in between mines and smelters, and all is in readiness to "blow in" as soon as the railroad moves Globeward. The year has been utilized in doing development work, more development having been accomplished in the main mines about Globe than in five years before. The Grand Canyon railway will open up some copper mines that run in character of ores from free carbonates to base glance and sulphides and in metallic values up to 70 per cent.

MEXICO.

A Nogales dispatch says Marcus Daly of Montana, by his representative J. R. Toole, has purchased from F. C. Aguillar & Co., for $100,000, the Sultana mine, in Cerro del Oro, twenty-five miles east of Carbo, Sonora. Cerro del Oro district extends from Rayon to Horcasitas, on San Miguel river. Toole will employ 150 men in development work.

The Santa Rosalia shipped seventeen tons that brought $30,000. There are two more carloads on the way from Mexico. There is said to be 4 feet of ore in the shaft, which is past the 250-foot level. Good prospects have also been found in new ground.

The Esmeralda mine, near Minas Prietas, Sonora, has 1300 tons of ore on the dump which averages one ounce in gold to the ton.

Obituary.

Capt. Hall, Supt. of the Le Roi mine at Rossland, was killed in the mine last Wednesday morning. He fell from the surface to the 600-foot level. He had been making his daily inspection of the mine and coming to the surface stepped from the skip to a narrow beam dividing the double compartment shaft. He lost his footing and plunged down to death. Capt. Hall was a native of Ireland, aged 61 years. For seventeen years he was superintendent of the Alice mine, near Butte, Montana.

Recently Declared Mining Dividends.

Golden Star M. Co., Gold Mountain, Utah, $2500; Jan. 3.

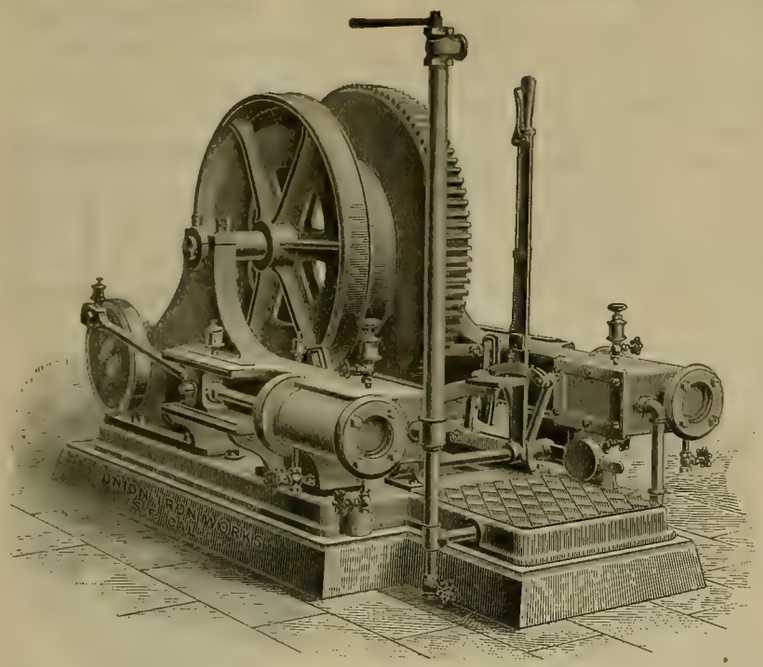
Swansea, Utah, 5 cents a share, $5000; payable Jan. 10.

Recent California Mining Incorporations.

Alaska T., T. and M. Co., San Francisco; capital stock, $2,000,000; subscribed, $60,000; W. C. Gates, W. W. Phillips, C. P. Troy, W. H. Metson, M. J. Laymance, R. B. Mott, R. McKillican.

Commercial Paragraphs.

The Fulton Engineering and Shipbuilding Works of San Francisco have removed their offices to 15 First street.



The Westinghouse Electric and Manufacturing Co. has declared a quarterly dividend of 1¾ per cent on the preferred stock of the company, payable Jan. 3rd, '98, to stockholders of record.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

The COLORADO IRON WORKS CO., Denver, Colo.,

ENGINEERS AND MANUFACTURERS,

Beg to draw your attention to the introduction of the . . .

FINLAYSON PATENT WIRE ROPE TRAMWAY.

It is of the double rope pattern and the newest and best thing in its line ever placed on the market. The automatic features, simplicity of construction, ease of running and economy in operation places the

Finlayson Tramway

far ahead of all other systems of aerial ropeways. It is unsurpassed in tonnage capacity. It is on the principle of "You push the button and the machine does the rest." If interested send for special catalogue.

Our Line of Manufactures includes all kinds of Modern Equipments for the Successful Milling and Smelting of Metalliferous Ores. Special Catalogues on Application.

HEALD'S
BUSINESS COLLEGE.
24 Post Street, - - - San Francisco.

Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Mill Construction, Assaying, Blow-Pipe Analysis Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application

The College has also Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal.

Brooklyn :: Hotel,
208-212 BUSH ST., SAN FRANCISCO, CAL.

Conducted on both the European and American plan. This favorite Hotel, located in the best and most central portion of the city (being in the same block as the Mills Building and immediately adjoining both the Telephone Building and the First National Bank), is under the experienced management of Chas. Montgomery, and is as good, if not the best Family and Business Men's Hotel in San Francisco. Electric return call bells in rooms.

Board and Room per day, $1.00 to $2.00. Board and Room per week, $6.00 to $12.00. Single Rooms, 50 cts to $1.00. Family Rooms, $1.00 to $1.50.

Free Coach to and from the Hotel.

Assaying Gold
.....AND.....
Silver Ores.

THIRD EDITION JUST OUT.

A Standard Work.
By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

THE GREAT MINING FAIR
WILL OPEN
Saturday Evening, January 29, 1898,
AND CONTINUE FOR FIVE WEEKS,
AT THE MECHANICS' PAVILION, SAN FRANCISCO.

The Fair will contain practical exhibits and demonstrations of quartz, placer and all other methods of mining, and mining machinery. Complete working plans of the North Bloomfield mill will be in operation on a large scale.

In connection with the Fair there will be a complete Klondike outfitting exhibition, together with Klondike cooking lectures and practical demonstrations of packing supplies over the trails by horses, burros and men; also the methods of transporting these supplies across the lakes and down the Yukon river to Dawson.

For information, apply to the Secretary, No. 31 Post Street, San Francisco, Cal.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$5 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Skeleton Mining Report.
Or great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts

Stamp Milling of Gold Ores.
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

"THE MINING LAWS OF CALIFORNIA"
by Frederic Hall, author of Hall's Mexican Law. Price, 30 cents by mail, Postal or Express Order. With opinions of the Attorney-General and J. F Cowdrey, Esq., on the New State Location Law and Court Decisions on important points. Address J. BELL, Publisher, Box 424, Los Angeles, Cal

PATENTS

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Pacific Placer Machine.

Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our larger Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb., 400 lb., 550 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 6, 1898.

General trade has been good for the first week in the new year, which leads business men to look forward to even a more prosperous year than was 1897. About all the firms have taken account of stocks and striking a balance sheet for the year. So far as can be learned they are surprised at the increase in business and also the small loss by failures. There have been a few large failures but a very large falling off in small failures. It is the latter which hurts the most. Rains to-day have dispelled the feeling of gloom which began to set in, for if general and of several days continuance they assure large crops, particularly if we have the usual spring rains, and a supply of water for mining purposes through the summer months. All kinds of leather belting have been advanced in our market 15 per cent, by reducing the trade discount that much. At the East the advance is 25 per cent. Further advances are looked for if hides and leather continue to move up, which from present prospects looks as if they will go to still higher figures.

The local money market is easy. The savings banks, with the exception of one, have reduced the rate of interest allowed depositors; this indicates a lower rate of interest by them this year. These institutions are restricted by law in loaning money to certain kinds of securities, and the offerings of these are light, while the prices for desirable bonds are high. The commercial banks continue to report funds accumulating. This is but natural while the January disbursements are being made and no special demand for accommodation. On gilt edge security, low rates of interest can be secured, and also on the better class of commercial paper, but the latter is offering sparingly. The East reports the markets easing under heavy disbursements. It is expected that before two weeks the markets there will have assumed their normal condition, and funds be secured at lower rates of discount. It is confidently predicted that speculation will revive on the stock exchanges, which will call for more funds.

New York Silver Prices.

NEW YORK, Jan. 6.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	26⅝	57¼
Saturday	....	....
Monday	26 9-16	56¾
Tuesday	26¾	55⅞
Wednesday	26 3-16	55⅝
Thursday	26¾	56⅞

	Copper.	Lead.	Iron.	Tin.
Fri.	10 90 @11 00	3 72½	10 00@12 25	13 70
Sat.	....	....	....@....	....
Mon.	10 90 @11 00	3 72½	10 00@12 25	13 75
Tue.	10 90 @11 00	3 70	10 00@12 25	13 75
Wed.	10 90 @11 00	3 70	10 00@12 25	13 77½
Thur.	10 90 @11 00	3 70	10 00@12 25	13 77½

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.82¾
London Merchants	$4.81½
London Sight Bankers	$4.85½
Refined Silver, per oz., 1000 fine	55%
Mexican Dollars nominal	47@—

SILVER.—The market has fluctuated to lower prices at home and abroad. As usual to the holidays the demand abroad is quiet. It is expected that improved call will set in soon, but on what this opinion is based it is hard to say, unless it is that the difficulties in China will subside and that country require more silver. India, it is expected, will continue to be a purchaser until the crops have been marketed.

MEXICAN DOLLARS.—The demand is slow. Exporting is falling off.

COPPER.—The market at the East continues remarkably steady, considering the engineers' strike abroad is still on. The outlook for 1898 is favorable for an increased consumption in this country and abroad on that of 1897.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	— @16¼
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16¼

TIN.—There is nothing new to report. The market is steadier for pig, but the demand is, as yet, slow here; but it is improving at the East for to arrive and shipment.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

QUICKSILVER.—The market holds steady. The demand is slow.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market is easier for pig, both here and at the East.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75	@	5 00
Sheet	6 30	@	6 80
Pipe	5 60	@	6 10

SHOT.—The market is easier.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

IRON.—The spot market is unchanged. Imports the past week aggregate 120 tons from Liverpool. The consumption at the East is the largest in the history of the country. A private circular reports: "The total imports of pig iron have been 10,421 tons—3505 tons from England, the balance was Eastern. Prices this year were the lowest on record, and it is singular that any foreign can be imported unless at a loss, having $4 per ton duty to pay, and its original cost is higher than American. Only 198 tons of foreign scrap iron were imported; there were 1116 tons received here last year. In 1892, 11,113 tons were received. The low price of pig iron causes the shrinkage in consumption."

NAILS.—The market is firm.

We quote the following basis: 20d to 60d, inclusive—wire $2.60, cut $2.50.

	To Arrive.	Spot.
AMERICAN.		
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50
ENGLISH.		
Barrow	$21 00	$33 00
Gartsherrie	21 50	23 00

COAL.—The market is steady to firm. From the annual report of J. W. Harrison we excerpt the following:

"The fuel consumption of California this year (1897) is about 7 per cent greater than in 1896, which evidences that the outgoing year has been a fairly profitable one for some of our manufacturing branches. Coal freights from Australia and Great Britain have ruled high for several months past, thus aiding to sustain full figures, as our coast colliery managers regulate their scale of prices by the import cost of colonial and English. Hence this year has proved a very profitable one for our northern coal fields. It is a query how the local coal market will shape itself in 1898. There is no doubt as to the ability of British Columbia and Washington to fully supply us with all the fuel we may need, in case foreign shipments should diminish, but the earmarks are visible of probable labor troubles when the Klondike exodus commences, and the writer predicts that all grades of laborers will catch the fever. Even if no trouble emanates from that source, there will certainly be a sparsity of vessels for transporting coal, as they will assuredly drift into the more profitable business of carrying freight and passengers towards the Alaska gold fields."

The following table of prices will show the monthly fluctuations of foreign coals for spot cargoes—the average price as given for each month:

	Australian (Gas).	English Steam.	Scotch Splint.	West Hartley.
January	$5.25	$6.35	$6.50	$7.00
February	5.25	6.25	6.50	7.00
March	5.15	6.25	6.25	6.75
April	5.10	6.00	6.25	6.75
May	5.15	6.25	6.25	6.75
June	5.20	6.25	6.25	7.00
July	5.25	6.25	6.50	7.00
August	5.50	6.50	6.75	7.25
September	5.75	6.75	7.00	7.25
October	6.00	6.75	7.00	7.25
November	6.10	6.75	7.00	7.25
December	6.10	6.75	7.00	7.25

The various sources from which we have derived our supplies are as follows:

	1894 Tons.	1895 Tons.	1896 Tons.	1897 Tons.
British Columbia	647,110	654,295	551,852	558,372
Australia	211,733	268,960	273,851	281,466
English & Welsh	157,562	201,180	156,368	107,969
Scotch	18,636	4,098	8,356	4,081
Eastern (Cumberland and Anthracite)	16,640	26,863	17,907	21,335
Seattle (Franklin, Green River, etc.)	153,199	150,888	128,919	220,175
Carbon Hill, So. Prairie, etc	241,974	256,267	255,903	286,205
Mt. Diablo and Coos Bay	65,263	84,954	110,237	115,150
Japan, Alaska, etc.	15,637	9,015	2,247	6,587
Total	1,527,754	1,653,520	1,505,660	1,601,540

COKE.—The total receipts in 1897 aggregated 30,320 tons, 5812 tons less than in 1896, 2573 tons of which came from British Columbia and 1889 tons from Australia. These are two new sources of supply for this market.

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is firm with a good demand ruling.

The market is quoted as follows:

Refined, in carload lots, in barrels	6
Refined, in carload lots in sacks	5¾
Powdered, in car lots	6¼
Concentrated, "	5½

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

POWDER.—The market is firm at current quotations.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

Chemicals.

There is absolutely nothing new to report, but it is expected that before the current month passes there will be a stiffening in some and a more active demand from jobbers, whose stocks have run down. New York mail advices do not report anything new since our last week's issue.

CYANIDE OF POTASSIUM.—The market is steady.

Our market is quoted for chemical pure 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1¾c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6½@7c per pound in carboys.

BONEASH.—There is a slow demand.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firmer.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steadier at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is quiet, with a firmer tone.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Jan. 6, 1898.

The market held firm at steady prices last Friday, and Monday morning, but in the afternoon it began to show signs of being top-heavy, which brought in the nimble chippers who began to sell. On Tuesday the feeling was weaker with some outsiders taking their profits and the chippers still selling, which resulted in quite a shading in prices yesterday. While this decline may be a surprise to some yet the points put out last week show that the manipulator engineered it by standing from under the market and let bear chippers beat it down. If the points put out are to be carried out now Con. Virginia ought to sell for less money, about $1 a share. It is only by false upmove that the outside can be made to unload, for everything points to the inside wanting more shares notwithstanding their large pool holding. It is quite possible that the more desirable shares are still held too largely by the outside and the market is worked so as to disgust holders into selling. To do this successfully more assessments will be levied—for shares they are after and shares they will have. The general condition of the country, with speculation reviving everywhere and interests at home and abroad centered on this coast, it is not likely that the moneyed inside will miss the opportunity of making a deal the coming spring, but while it is under way, low, sick and dragging spells must be looked for. It is only by doing this that the public can be relieved of their holdings, but when the time comes to sell to the public then the tactics are changed. The news from the mines is of rather an encouraging character. The work in several is of an assuring nature, for it gives promise of ore strikes within the next few weeks, providing the mining share manipulator does not have it intimated to superintendents that it is not desirable, or if one is made hush it up and either stop work or else change the work so as not to show it up. Time alone will solve it.

The news from the Comstock mines through officially filed letters does not indicate anything of special interest, but private advices point to more activity at several points. It is stated that the preliminary or dead work has been finished in some mines and is nearing the end in others. Active exploiting will be the order soon with some, the direction generally toward points where there is a reasonable assurance of finding ore. It has been the history of about all the mines on the Comstock to have reports made in such a way as to mystify the public. In Utah they are still going in a northwestern direction. At last advices they were in vein matter. The distance run is nearly 350 feet. In Sierra Nevada there appears to be a firmer conviction than ever that when they strike the ore, which will probably not be until in February unless they make faster progress, it will show quite an improvement. The official letter filed last week reported slow work owing to making repairs. In Union work, so far as officially advised, is confined to running east on the 900-foot level. They are running east on the 1000-foot level of Mexican. Judging from the work reported it seems safe to affirm that something has been found and that they are blocking out the ground in Mexican and Union. The blocking out is often done to kill time and also get outsiders to sell shares by the old freeze-out process of levying assessment; but in this case the work may be an exception. They continue to go west in Ophir on both the old Central tunnel level and 1000-foot level. In the latter crossdrift the formation was favorable. In Con. Virginia active work is continued on the 1550-foot, 1650-foot and 1750-foot levels. In the bottom of the north drift, ran from an upraise from the 1650-foot level, a streak of $50 ore was struck. This may encourage them to prospect the streak to see what it may develop into. Nothing comes from Best & Belcher. In Gould & Curry no work has been done the past two weeks. In Savage they are going west from the 500-foot level. They are in about 145 feet. On the 130-foot level they are cleaning out and repairing an old west drift. No work in Hale & Norcross.

In Chollar more active work ought to be the order soon. In Potosi they are getting ready for more important work. The Bullion-Potosi drift is being driven ahead to connect with the Crœsus shaft. In Alpha blocking out work is the order. The work in the mine indicates they are getting ready for more active and important work. It may be they intend to develop the gold ore found to the west and quietly ignored since. There is no change in the Con. Imperial work, neither is there in Confidence. From Yellow Jacket nothing new comes to hand. Only one shift is worked. From the nature of the work in Belcher and Crown Point, it looks very much as if the management does not want to make an ore strike, although the work is being prosecuted with a fair degree of energy. No change reported in the official letters. From Seg. Belcher and Overman nothing new is at hand. In Alta they are getting ready to stope. The expected ore strike in Justice has not materialized; it is, like the pot of gold at the end of the rainbow, just ahead. Rainbow chasing is good for miners, as it gains them work, but the showing in Justice does justify more exploiting.

From the Brunswick lode our advices indicate that the companies that have not commenced going west will do so, as recommended in the recent report. From all we can learn it looks as if this is the right direction for striking a fair to good-sized body of paying ore. It will not be long before the result will be known—say from three to six weeks. In the 600-foot level the west crossdrift run jointly by Best & Belcher and Con. Virginia is in about 60 feet, and the west crossdrift in Gould & Curry is in over 90 feet. The latter shows quartz and porphyry. In Savage they are still going north, and were at last advices in quartz giving low assays. Joint work to the west is being done on the 500-level by Chollar and Potosi. There is no change in the work on the 600-foot level. Active exploiting work, with no change reported, is being done on the 550-foot, 650-foot and 750-foot levels of Occidental.

The following illustrates the changes of the week:

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

E. N. BREITUNG,
Marquette, Mich., U. S. A.
Operator and Dealer in
Mines, Mining Properties and Mineral Lands,
Mining Stocks, Bonds, Options, Leases, Contracts and Securities.

MONEY LOANED ON BONA-FIDE MINES

WILL EXAMINE on reasonable terms all kinds of Mines, Mining Properties and Mineral Lands as to their value, method of working and the condition of their titles.

WILL GIVE Options, Leases, Bonds and Contracts on all kinds of Mines, Mining Properties and Mineral Lands.

Assay and Chemical Work Done on Reasonable Terms.

Have best of bank and other references. Use McNeill's or A B C Telegraphic Codes.

DO ALL OUR OWN EXPERT AND CHEMICAL WORK.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

Rainfall and Temperature.

The following data for the week ending 5 A. M., January 5, 1898, are from official sources, and are furnished by the U. S. Weather Bureau for the MINING AND SCIENTIFIC PRESS:

A Land Without Life.

The west coast of South America from north of Callao, Peru, to the port of Coquimbo, Chile, is a rainless region. From the Andes to the Pacific no rain falls, and no vegetation or animal life exists beyond what man brings there. It is a dead world. The last rain which fell in Antofogasta, Chile, was the first that had fallen in sixteen years, and the last shower in Iquique, Chili, was the first rain which had fallen in twenty-four years. The hills or mountains back of both these cities are bare rock and sand and red loose clay, yet the day after the rain a greenish tinge began to show itself and by the second day these bare and inhospitable hills were dressed in a green coat from top to bottom. As no more rain fell, this verdure quickly dried up and died. The query rises naturally, whence did this vegetation come? If from seeds lying dormant in the soil, then once sprouting would finish this source, and the short life of this plant gives no opportunity for the development of seed.

Every succeeding time when rain falls in these regions in periods of from fifteen to forty years the same phenomena occur. The growth evidently springs from some root which lies dormant in the soil, and is rather remarkable proof of the powers of nature to adapt life to hard conditions, as there is no evidence that for several million years past there have been any more favorable conditions for life on this coast than exist now. No evidence exists that at any time vegetable life has existed in all this region, and until the course of the winds changes all this region is destined to remain, as it is to-day, a barren desert.

The Mineral Land Bill.

A Washington dispatch says that when the Public Land Committee of the House meets next, one of the first matters to be laid before it will be the report of the Secretary of the Interior upon the California mineral lands bill. Congressman de Vries sent the bill to the department recently and it was turned over to Commissioner Hermann, who has a report in preparation. That it will be favorable is indicated by the fact that Hermann has within a week declared himself in favor of the legislation and practically promised to recommend the passage of the bill. Every member of the delegation is believed to be behind the bill, and a strong effort will be made to have it brought up soon, should it be reported favorably from the committee, as now seems certain.

Colorado's Gold Fields, Illustrated.

Just out, with correct map and nearly 100 mining views natural as life. This valuable book will be sent free, prepaid, with our big 56-col. family paper 3 months on trial for 25c; club of 5 and 5 books $1. Latest mining news. Mention THE PRESS and address *Illustrated Weekly Sentinel*, Denver, Colo. Cripple Creek is fully described.

COMPLETE MINERAL CATALOGUE.

186 pages, with 40 engravings. Contains a table giving name, composition and form of all known minerals, with a supplement bringing the work up to date; a new metallic classification, showing what minerals contain each element; alphabetical index of names; lists giving the specimen values of minerals, etc., etc. For the use of students, prospectors, mining experts, chemists and others. *Prices, postpaid: Paper bound, 25 cents; Cloth, 50 cents; Calf, interleaved, $1.* **Published by DR. A. E. FOOTE, Mineral Specimens; Sets of Ores for Reference, etc., etc. Price Lists Free. 1317 Arch Street, Philadelphia, Pa., U. S. A. Established 1876.**

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DEC. 28, 1897.

596,119.—INSULATING MATERIAL—Borrowe & Lumley, S. F.

596,362.—RAISIN SEEDER—C. S. Cox, Fresno, Cal.

596,146.—ALARM CLOCK.—W. Dupen Whatcom, Wash.

596,105.—RAIL JOINT—F. Erdmann, S. F.

596,110.—ROCK DRILL—J. K. Firth, S. F.

596,101.—OVERHEAD SWITCH—D. Gaul, Los Angeles, Cal.

596,324.—SMOKELESS POWDER—F. A. Halsey, San Rafael, Cal.

596,156.—BADGE, ETC.—J. Hansen, Everett, Wash.

596,095.—EJECTOR FOR ASHES—F. H. Heath, Tacoma, Wash.

596,327.—FOLDING GATE—Henning & Schmid, S. F.

596,146.—COMBINED HARVESTER—B. Holt, Stockton, Cal.

596,210.—BICYCLE SUPPORT—F. Johnson, S. F.

596,329.—STREET SWEEPER—T. R. Jones, Sacramento, Cal.

596,113.—BEVEL GAGE—L. Manning, Clarksville, Cal.

596,114.—WHEEL RUNNER—J. McNaughton, Ruby Hill, Nev.

596,415.—AMALGAMATOR—W. Notley, Los Angeles, Cal.

596,178.—PROPELLER MECHANISM—E. E. Onlevey, Sacramento, Cal.

596,179.—STEERING APPARATUS.—E. E. Onlevey, Sacramento, Cal.

596,124.—WAVE MOTOR—Pyle & McDonald, Simi, Cal.

596,218.—FREIGHT VESSEL—C. Salmond, S. F.

596,219.—STAMP WALLET—A. Schneider, San Diego, Cal.

596,221.—FLOWER HOLDER—Jennie L. Sturtevant, Gilroy, Cal.

596,343.—FRUIT PITTER, ETC.—T. M. Topp, Sacramento, Cal.

596,191.—REGULATOR—H. H. Tracy, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FOLDING GATE.—James H. Henning and John E. Schmid, San Francisco Cal. No. 596,327. Dated Dec. 28, 1897. This invention relates to an improvement in gates of that class which are composed of essentially vertical bars or members and which are designed to open and close horizontally. The object of the invention is to so construct the gate as to make the openings when it is extended as small as possible, and to provide for a great rigidity to resist torsional strain. It consists of vertical bars made T-shaped in transverse section, having slots made through the central leg, diagonally disposed bars crossing each other and pivoted in the slots, said bars having a reverse curve made upon each side of the pivot point, so that the upper and lower portions are thrown out of line with each other to fold against the opposite sides of the central leg of the main bars, and thus allow the whole gate to be closed up into very small compass. Between the main bars are intermediate ones with which the upper end of two of the adjacent diagonal bars are pivoted. Slides are fitted to clasp these bars, and with these slides the downwardly extending arms of the correspondingly adjacent pairs of diagonal bars are pivoted so that the upward movement of the bars and the downward movements of the slides allow the parts to be closed together, latches project from the central vertical bars and brace bars are so hinged as to press against opposite sides of the vertical bars and engage with the latches. The bottom lower ends of the gate sections are provided with rollers, and these travel in a channel iron guide which lies upon the floor for the purpose and may be folded up against the edge of the gate and locked thereto when the gate is folded.

FRUIT CUTTING AND PITTING MACHINE.—Thos. M. Topp, Sacramento, Cal. No. 596,343. Dated Dec. 28, 1897. This invention relates to a device which is especially designed for removing pits from fruits, such as apricots and peaches. It consists essentially of a pair of circular disks, mounted to rotate with their peripheral edges meeting in a single plane, concavities or depressions formed in each of the cutters having holding points within the depressions and registering so as to seize and hold the fruit pit when the cut takes place. Hinged arms have cups mounted at the outer end adapted to grasp the fruit and hold it in line with the edges of the cutter, and shafts or pins carrying the cups are mounted upon arms, while the machine has fixed lugs upon it with which these arms contact, so that the cups are turned on their axes and the twisting movement given to the fruit after it has been cut, which acts to release it from the pit.

SMOKELESS POWDER.—Francis A Halsey, San Rafael, Cal. No. 596,324. Dated Dec. 28, 1897. This invention relates to improvements in the manufacture of explosive compounds, and especially of that class known as smokeless gunpowder. It consists essentially in the combination or alkaline metal and earth metal salts and ammonium picrate in such a manner and such proportions as to produce the desired results.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from B. Frecoero, in the Frazer and Swank Gravel mine at Washington Ranch, Calaveras Co., to deposit tailings in an old pit; from Manuel Silva and Joseph Enos, in the Cherokee Flat mine at Cherokee, Butte Co., to deposit tailings on a flat below the mine; from J. Lagomasino, in the Grizzly Bear Placer mine near Johnsville, Plumas Co., to deposit tailings in Squirrel creek; from Paul Zerga et als., in the Last Chance Placer mine near Sierra City, Sierra Co., to deposit tailings on a flat below the mine; from T. T. Kirkham, in the Mt. Vernon mine near Nevada City, Nevada Co., to deposit tailings in Mt. Vernon ravine; from William Ross, in the Clark mine near Dieta, Amador Co., to deposit tailings in Deadman's creek; from Chas. E. Wise, in the White Oak mine near Colfax, Placer Co., to deposit tailings in Live Oak ravine; from John Solari and Joe Devencenzi, in the Red Gulch and Mahala Flat Hill mines near Volcano, Amador Co., to deposit tailings in a ravine below the mines; from J. F. and M. H. Goodman, in the Bicknell mine near Volcano, Amador Co., to deposit tailings in the North Branch of Sutter creek; and from S. R. Hackley, in the Indiana and Gold Bug mine near Omo Ranch, El Dorado Co., to deposit tailings in Perry's creek, gives notice that a meeting will be held at Room 69, Flood Building, San Francisco, Cal., on January 17, 1898, at 1:30 p. m.

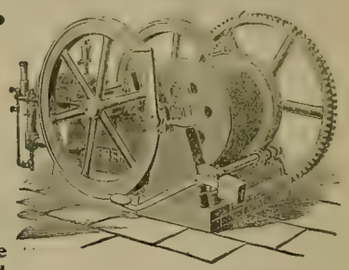
Lunkenheimer's "Handy" Gate and "Lever Throttle" Valves



"HANDY."

Are unequaled in places where a quick-acting valve is required. The "Handy" for 75 lbs. pressure and the "Lever Throttle" for 175 lbs. The "Handy" is made in sizes ranging from ½" to 4" in brass; 2" to 8" in iron, brass mounted; 1" to 8" in all iron. The "Lever Throttle" in brass from ½" to 4;" in iron, brass mounted, 2" to 8"; in all iron, 1" to 8". Both styles in screwed ends only. Simple, practical, and low-priced. Specify Lunkenheimer's "Handy" or "Lever Throttle" and get the best. Supplied by dealers. Catalogue free for the asking.

"LEVER THROTTLE."

Weber GASOLINE HOISTING ENGINE.

MONEY SAVERS.

Costs to run One Cent per Horse Power per Hour. No Coal or Wood and very little water required.

This cut represents our 10, 15, 20, 30, 40, 50 H. P. Geared Hoist.

Hoisting for 32 Cents Per Day.

SAN PEDRO, N. M., April 23, 1897.

WEBER GAS & GASOLINE ENGINE CO.,
KANSAS CITY, MO.

GENTLEMEN—Yours of the 14th at hand. The 10 H. P. "Weber" Gasoline Engine Hoist we got is "out of sight," and the longer we run it, the better we like it. We are now down with our shaft in the neighborhood of 175 feet. We only work one shift. All it costs us for gasoline is 32 cents per day. It takes us from three to four hours a day to do our hoisting. Yours truly, J. T. MCLAUGHLIN.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of December, 1897, an assessment (No. 29) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of January, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of February, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 3rd day of January, 1898, an assessment (No. 12) of 9 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1898, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

THE SAVAGE MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 6th day of January, 1898, an assessment (No. 94) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. B. HOLMES, Secretary.

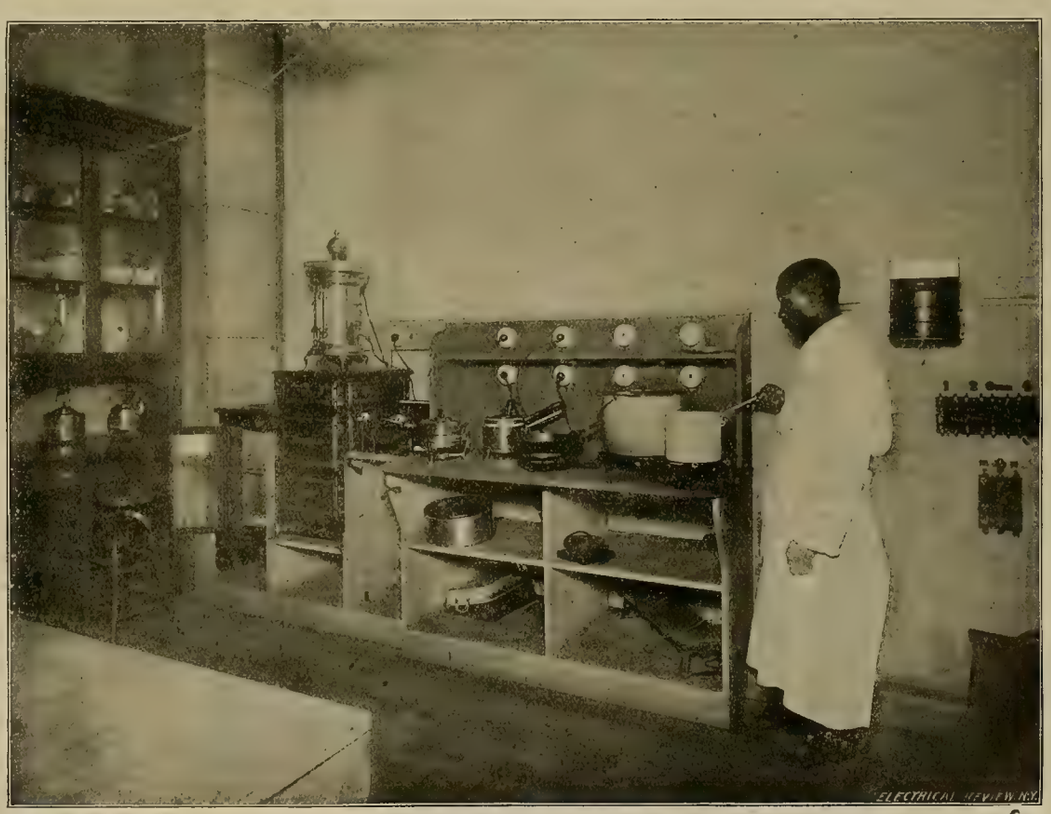
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.

No. 1958.—VOLUME LXXVI. Number 3. SAN FRANCISCO, SATURDAY, JANUARY 15, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Cooking by Electricity.



Some time ago the editor of this paper, on being shown through the works of the Edison Power & Light Co., on Stevenson street, San Francisco, noticed in one room several electrical appliances that Electrician Smith was devoting to culinary purposes, he expressing the hope that some day he would be able to install an electric kitchen.

This hope has been realized in the Duane street station of the Edison Electric Illuminating Co. of New York, where has been arranged a complete electrical kitchen, which is presided over by a skilled *chef*, who serves electrically cooked luncheons for the officials and heads of departments of the company. It is done by the Edison Co. largely with the view of illustrating the practicability of the electric system of cooking. This modern electric kitchen is portrayed in the accompanying engraving, for which we are indebted to the courtesy of our Atlantic contemporary and namesake, the New York *Electrical Review*.

MORENO DAM, SAN DIEGO CO., CAL.

The electric ovens are brought to the desired heat in a very short time and a uniform degree of temperature is easily maintained, so that the cooking process requires less time than by the ordinary heat direct from coal. For boiling sauces, vegetables, etc., special stew-pans and pots are utilized which are attached by means of a plug to the circuits and are operated independently, so that as varied a *menu* as may be desired can be prepared by merely attaching broilers and kettles to the service circuits. The kitchen is fitted with stone slabs for the cook's work, a white-tiled sink with hot and cold water and in the corner, standing close against the largest piece of cooking apparatus, the electric ovens, is the refrigerator, the radiation of heat being so slight as not to affect the ice in close proximity.

A MODERN ELECTRIC KITCHEN.

"This beats my old coal kitchen, for I have no ashes nor dirt, and when the heat is wanted it is there. It cooks in two-thirds the time that would be needed in an ordinary stove," said the *chef*. "I can bake a loaf of bread in sixteen minutes, a pie in nine minutes and biscuits in four minutes;" and he added, "your fire won't die down so that you must put fresh coal on, which deadens it for a spell and then gives too much heat." One of the officials of the Edison Co. said that current for electrical cooking at consumers' rates costs slightly more than fuel for coal stoves, but the economy was in the fact that work is done in less time with the current, and the heat is generated only when desired for service, ceasing the instant it is turned off, but that it had great advantages in cleanliness and ease of management, which would soon bring it into more common use.

Irrigation in Southern California.

Last year was a notable one in the development of water in the extreme southern part of the State. During '97 the great water system of the Southern California Mountain Water Company was greatly developed. The system comprises four immense reservoirs, known as the Morena, Upper and Lower Otay and Barrett's. During the year the Lower Otay reservoir was completed. The reservoir dam is 130 feet high, and will impound 42,000 acre-feet of water. The Upper Otay is a storage, and not a catchment, reservoir, and at 120-foot contour will impound 1059 inches. So far, only the foundation of this structure has been laid. The Morena dam, of which an engraving is here given, has been constructed to a height of almost 100 feet, but another 50 feet must be added before the structure is complete. At 150 feet this reservoir will impound 3219 inches of water. These works when completed will represent an investment of at least $3,000,000, and will command thousands of acres of productive land in southern California.

THE following is furnished by a practical man in answer to a request for "a good recipe to temper steel:" Heat to a dull red, rub with a piece of hard soap; then finish heating, harden in clear cold water. The potash in the soap prevents oxygen from uniting with the steel and forming a scale. In drawing, the colors can be seen without polishing the piece.

S Patents for Pacific Coast Inventors; Notices of Recent Patents, 62.

"I AM pleased to renew my subscription for '98. I consider the MINING AND SCIENTIFIC PRESS the most valuable paper of the kind in existence." This is in effect what a great number of men in this west half of America are now writing the business office. Leading advertisers say: "Did the announcements we carry in your paper cost three times what they do, we would consider the investment a profitable one." All of which is gratefully appreciated, the effort being to continue to deserve such kind statements from readers and advertisers alike.

THE general preliminaries of the Golden Jubilee and Mining Fair were arranged some time ago; the details now occupy the attention of the committees, who are working to the end that the whole thing shall be in every way an assured success. It is within the bounds of truth to say: "Better come than wish you had." The parade and week of festivities will be worth participating in, and the Miners' Fair, beginning January 29th and closing March 6th, will be of value and interest to every one in any one way connected with any form of gold mining. The Committees have decided that January 31st shall be "Miners' Day."

ANSWERING an inquiry as how best to clean amalgamating plates, Mr. Denniston, an experienced manufacturer of silver-plated amalgamating plates, gives preference in cleaning these plates to a weak solution of cyanide of potassium or a strong solution of salt and water, using a brush with each. To insure good amalgamation, the plates must be kept clean and bright. Grease or oil, of course, prevent proper amalgamation. The presence of these deleterious substances should be carefully avoided, and, if present, must be counteracted by the introduction into the battery of a saturated solution of wood ashes. Cyanide of potassium in dilute solution is used to promote amalgamation, but the practice of using the cyanide is less common than formerly. One or two pounds will be sufficient to clean the plates of a 40-stamp mill for a year. Some use a solution of vinegar and salt for cleaning plates. Very dilute nitric acid is also used, the plates being at once rubbed with quicksilver after being washed with clear water. The quicksilver itself is carefully washed and strained through a canvas bag to remove as many impurities as possible and again strained. On a small scale, it can be strained by hand through a chamois bag. When it becomes dirty or mixed with foreign substances, it must be retorted at a low temperature to thoroughly clean it.

It Is the Law.

Under date of December 29th, '97, a Sulphur Creek, Cal., subscriber writes as follows: "Has there been any test case on the new law which requires mining companies to pay all employes once each month for preceding month? Does this law apply to companies whose stock is not listed? Can it be made to enforce payment once each month for the previous month?" Upon looking this matter up it was found to be of sufficient importance to justify editorial notice. The following digest of the law is furnished by Mr. A. H. Ricketts:

"The Act referred to was approved March 29th, 1897, and went into effect April 1st, 1897. (Stats. 1897, p. 231.) By its terms 'every corporation doing business in this State' is required to pay its employes at least once a month the wages earned by them during the preceding month, and a violation of this provision entitles each employe to a lien on all the property of the corporation debtor for the amount of his wages, which lien shall take preference over all other liens except duly recorded mortgages or deeds of trust; and in any action to recover the amount of such wages, or to enforce said lien, the plaintiff shall be entitled to a reasonable attorney's fee, to be fixed by the Court, and which shall form part of the judgment in said action, and shall also be entitled to an attachment against said property. An unrecorded deed is no defense to such actions. On the trial of such actions the corporation debtor shall not be allowed to set up any defense for a failure to pay monthly any employe engaged in transacting or carrying on its business the wages earned by such employe during the preceding month other than the fact that such wages were not earned, except a valid assignment of such wages, a set-off or a counter claim against the same, or the absence of such employe from his usual employment at the time of the payment of the wages so earned by him. All assignments of wages for the purpose of evading the provisions of this Act are declared to be invalid. All wages earned must be paid in lawful money, or in checks negotiable at face value on demand. This Act provides further that no corporation shall require and no employe of such corporation shall make any agreement to accept wages at longer periods than are provided therein as a condition of employment. That any corporation violating any of the provisions of this Act shall be subject to a fine not exceeding one hundred dollars or less than fifty dollars for each violation.

"This law, by its terms, applies to '*every corporation doing business in this State*,' without reference to whether or not its stock is listed in the stock exchanges of this or any other place, or whether it is a State or foreign corporation. The mere fact that a corporation is transacting business in this State and employing men is sufficient to bring it within the purview of this law as far as the payment of its employes are concerned.

"Payment of wages under this law may be enforced by placing a lien upon all the property of the corporation debtor and by an action to foreclose the lien; and payment may be further secured by attachment proceedings. The lien, of course, would only affect real property, while an attachment might cover both real and personal property. In addition to the amount sued for, attorneys' fees and costs of the action may be recovered. Every corporation is also made subject to a fine of not less than $50 or more than $100 for each violation of the provisions of this Act.

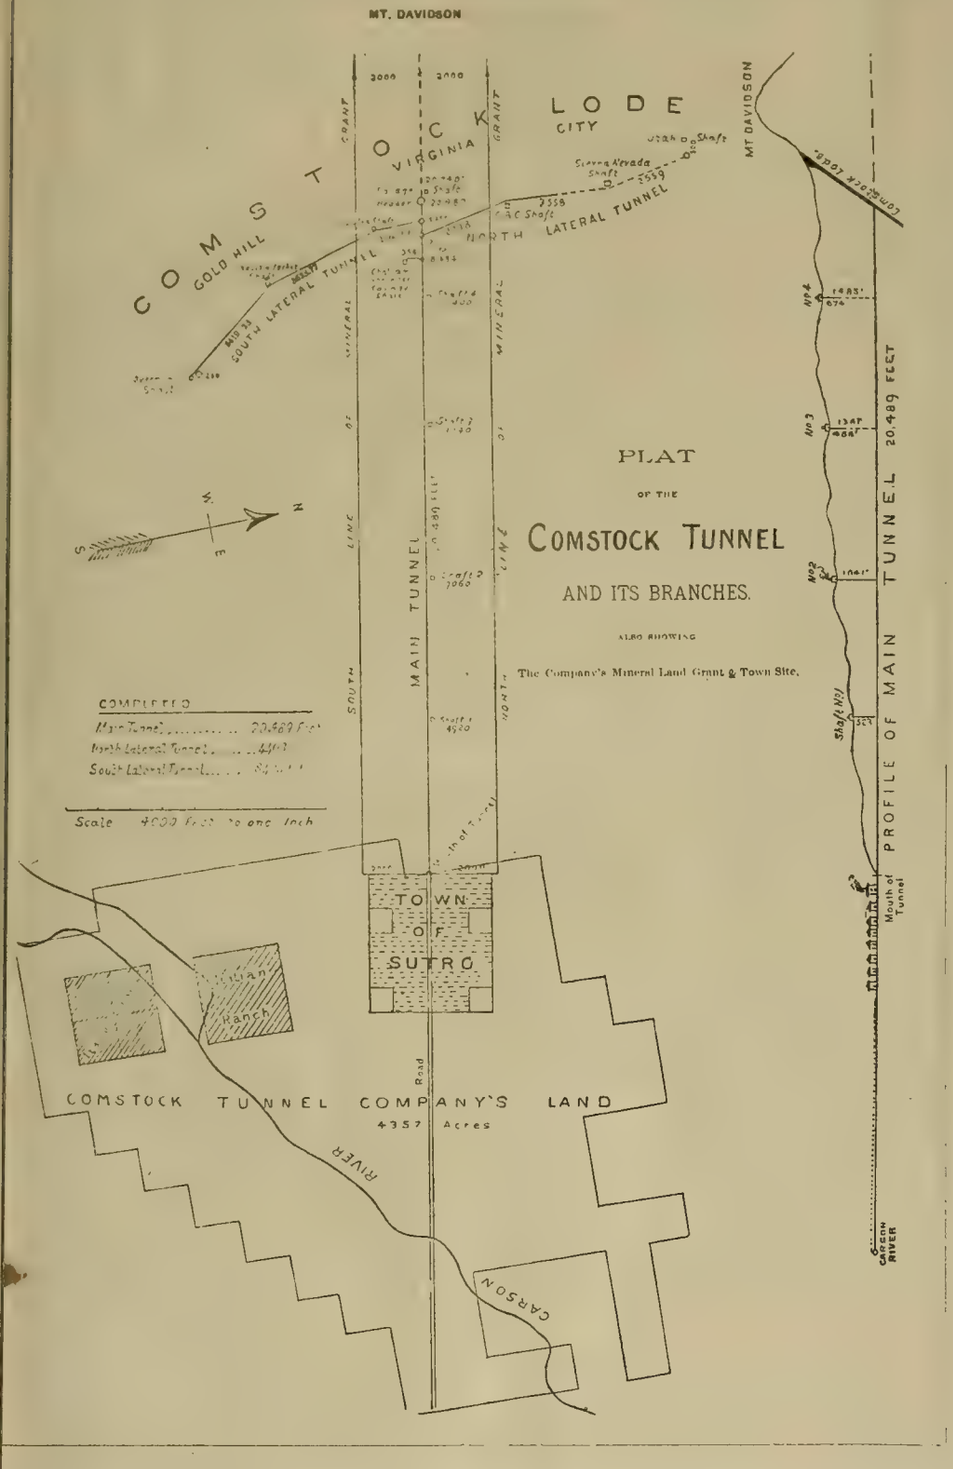
"The decisions of the Supreme Court of this State do not yet appear to contain any consideration of this law by that tribunal."

This law appears to be an injurious one, restrictive and vicious in its operation, and how it slipped through the Legislature is of itself somewhat curious. While general in its application, it appears to be intended as a direct "cinch" on some particular corporation. It is believed that, were a test case made, it would be declared unconstitutional. It is certainly in opposition to business interests and probably could be justly entitled "A Law to Prevent the Investment of Money in Business Enterprises in California." It is very doubtful whether the Legislature of California has the power to say what kind of a contract private parties may enter into. However, it is the law, and, until repealed or set aside by the proper legal tribunal, will obtain.

IN response to three simultaneous requests for some plan to clean quicksilver, it may be said that the best way to clean quicksilver is to retort it, but it is not always convenient to do that unless all the appliances are at hand. The bulk of foreign matter may be removed by other means, however. A convenient device is a long glass tube into which mercury is poured through a paper funnel, the funnel having a pin-hole at the bottom and serving to retain the dirt and dust. The tube may be filled with dilute nitric acid and be provided with a stop-cock below, or with a bent tube so that a short column of mercury may balance a long column of acid. An ordinary filter in a funnel, with a hole in the bottom of the filter, will remove a good deal of impure foreign matter from the mercury. Another method is to place the mercury in a basin and force nothing but cold or warm water through it from below, and any grease or foreign matter is carried off. If one has not steam power, etc., water may be led in pipes with proper fall. The basin has a cock and valve to draw off the clean mercury. Care must be exercised not to force the water too violently so as to cut up the quicksilver too much, and so carry off finely divided particles. A little dilute nitric acid should be kept on the surface of the mercury in its receptacle.

AS IN the preceding years, the New York City papers credit Messrs. Edison and Tesla with making astounding predictions, one of the discoveries recently credited to the former being the ability to "photograph thought." On page 60 of this issue is given some account of Tesla's latest, and since that was printed it transpires that Mr. E. is now credited with declared ability to extract gold from low-grade ore at so low a cost as to justify erection by him "in the South" of a million dollar plant. It is probable, however, that the usual exaggeration of daily journalism is made manifest in reports of interviews with those distinguished electricians. The New York dailies of the 11th inst. additionally announce "the discovery of what Mr. Edison believes to be a new metal which will take the place of malleable iron," his belief being based on an unusually hard product from his new magnetic ore separating mill in New Jersey. The distinguished services to science of those two men lends great interest to what they actually say or do, but the general reader should carefully distinguish between the genuine and spurious utterances. This phase of "scientific progress" is briefly but justly discussed on page 61.

AS WAS to be expected, the purchase by the New Zealand Government of the right to use a patent cyanide process has stimulated the business of patenting processes designed to be of profit, and the Australian Mines Department is in receipt of sundry other proffers, though some of the proffered processes are more curious than profitable to the mining public. One gentleman wants to sell a formula for treating gold ore with a solution containing "55% ammonia and 45% sulphuric acid." It is probable that the New Zealand authorities will compel inventors in that line to give satisfactory proof of the value of their "processes" before entertaining any propositions of purchase.



BY a recently enacted law of the Congress of the republic of Mexico permits for mining exploration, which have been so great a drawback to mineral development in Sonora, will be greatly modified. Under the new law such permits are to be limited to a period of three months only, and when one expires another covering the same area cannot be issued until six months afterward. Within that time the territory involved is open for prospecting to everybody, and discoverers can secure title to all ledges they find.

AN Arastra, Colorado, subscriber writes: "Will a pump with a 3-inch discharge raise water through a 6-inch pipe to the same height as it would through a 3-inch pipe?" All the conditions requisite to a full answer are not given, but, in general, it is largely a question of power proportionate to lessened or increased friction.

Report on the Brunswick Lode.

he managements of the different mining com-ies with locations on the Brunswick lode, Vir-a City, Nev., had a recent examination made n the possibilities of that lode. The main points he report are given herewith.

o understand the location of the lode is presented accompanying plot of the Comstock tunnel, ch cuts the Brunswick lode about midway in the age ground at shaft No. 3, 13,540 feet in from mouth of the tunnel, and at a depth of 1361 feet

om the surface. North of the tunnel, and adjoin-g the Savage, is the Gould & Curry, then come est & Belcher and Con. Virginia. To the south is he Hale & Norcross, Chollar, Potosi and Occidental.

Over twelve years ago John A. Church made an xamination of the Brunswick lode and wrote as ollows of its quartz bodies: "These form a mag-ificent system of quartz bodies parallel to the main ode—that is, the Comstock lode—and, so far as they ave been examined, quite equal to it in magnitude. Under any circumstances they are worthy of care-ul exploration, especially now that their fortunes ave been greatly improved by the construction of deep drainage adit—that is, the Sutro tunnel, now he Comstock tunnel. * * * All the known geo-logical facts make them just as promising quartzes as any the Comstock contains."

A large proportion of the latest report is taken up with a scientific dissertation on the lode to substantiate the deductions made, which corroborate Prof. Church's report made over a decade ago. The report says:

"The Brunswick lode has a general north and south course, the vein existing in a dyke of andesite of varying width—at times 200 and again 600 feet wide. The mineralized quartz vein meanders through the formation, but it holds more generally to the eastern or hanging wall side. The quartz is not found on the true contact walls, but a few feet distant. The hanging wall of the dyke, in which the vein exists, is porphyry, undoubtedly an altered andesite, and known on the Comstock as 'bird's-eye' porphyry.

"Between this 'bird's-eye porphyry' and the dyke there is a broad clay belt, showing not only the pressure and folding, but also establishing the nature of the ground in which the vein is contained. The hanging wall of the dyke in which this vein courses is an andesite containing crystals of sanidine and augite. The separations of the formations on the west, or foot wall, side are very faintly marked. It is demonstrated that the formations to the east of the hanging wall were later extrusive. Therefore we have a perfect fissure in the contact on the east side, in which the mineralized solutions which have produced the vein, or ore deposits, have followed the line of weakness. The dyke which controls and carries the vein is an andesite, which has been greatly altered by the intrusive silicious waters.

"From incline No. 2 (between Best & Belcher and Con. Virginia), passing north over the northerly end of the 'North' Cosmopolitan ground, and crossing the Six Mile canyon, the surface formations have taken a slide to the northeast. At some earlier epoch this last mentioned ground has had a deep-seated movement, also to the northeast, this movement having broken the Brunswick vein, or lode, at or near the road in Six Mile canyon. This deep-seated movement has likewise turned the southern end of the 'Monte Cristo' underground ore body to the west at the same time, or, rather, under the same movement, forcing the surface portion of the vein toward, and bending it over, to the east."

The above excerpt, particularly the latter part of it, seems to be the foundation on which the two experts worked in their examination of the lode, and that their deduction is correct is seemingly verified by examination of the lode, as far as practicable, both on the surface and underground. It is this fact that causes the two experts to express the belief that with work to the west paying ore will be found. They state that the systems of veins and stringers on which the Mackay, United States and Keyes are located run parallel with the Brunswick lode, passing through Silver Star and ending apparently east of the Buckeye. They express the belief that judging from the dip they join the Brunswick lode at a depth of about 1600 or 1800 feet below the surface.

The report says: "It can be stated that the Brunswick lode commences on the southern end of the Occidental locations, it being made of numerous feeders which there converge. Taking the lode running north from the summit, on the northern end of the Occidental locations—passing incline No. 1 (in the Hale & Norcross) and shaft 3 of the Sutro tunnel, and incline No. 2 to Six Mile canyon, the whole country has been pressed northerly and easterly. Taking the section of the vein and vein dyke which are shown in inclines Nos. 1 and 2, the formations exposed prove they have been under a great pressure from the west, so much so that the rocks show certain lines of cleavage plains, and also that the upper portion of the dyke, containing the vein, has been shoved over to the east and has then fallen back. It is particularly noted that these cleavage plains have a general northeast and southwest course; and where the matrix has been so pressed eastward these cleavage plains or seams are more or less filled with mineralized vein matter. These seams trend and generally lead to the ore shoots.

A seemingly thorough examination of several streaks and veins northerly of North Occidental were made, and of which the report says:

"These cross-veins or feeders all point toward, and seem to intersect, the Brunswick lodes on the grounds of the Chollar, Potosi and the northern end of the Occidental locations. These veins or feeders have more distinct and more perfect walls than those of the Comstock and Brunswick lodes proper; they are accompanied by a clay gouge and follow more or less the course of cleavage plains. The vein filling, though not as wide as on the lode, are more compact, containing, proportionally, more quartz, less gypsum and magnesia gangues."

In examining the underground workings on incline No. 1, the report says:

"The level of No. 1 incline which enters the Potosi ground is at the edge of this intersecting butte-dyke. To the west of this drift, near its south end, a chute of ore should be encountered. If this drift, which encounters the dyke, is driven a little east of south, toward the Occidental Consolidations, where the vein should be below the surface, on the pitch of the croppings which are on the south side of the intrusive dyke, it will pass through the mineralized streak.

"If this cross-dyke contains any of the royal metals, a body of pay ore should be encountered on the southern face of the intrusive dyke at its junction with the Brunswick lode on the Potosi ground, going toward the Occidentals."

The report mentions that one of the systems of mineral bearing streaks cut by the Silver City tunnel "has a course west of north, this being the Justice streak. The other streaks having a northeast course are those through the 'South' Cosmopolitan ground." * * * It further says: "At the north end the Cosmopolitan is intersected by the Succor. These two veins now course in close proximity toward the Occidental. If a shaft be sunk east of the Cosmopolitan's summit, at a distance of 650 feet, it would be on the line of depth of the joined veins which should exist about 1000 feet beneath the surface. The exploitation of this ground should develop large bodies of ore."

After a thorough and systematic examination of the underground workings in Occidental, they conclude:

"To strike the veins which are situate to the west of the butte, shown on surface at Incline, a crosscut should be run, a little north of west, at north end of 750 level. The future of the Occidentals is most promising, and the mineralized streaks, heretofore mentioned, at their convergence, should furnish a large body of ore."

A Great Gold Mine.

Written by JOHN W. GRAY.

In none of the newer portions of the world do the days of gold date back very far. In the colony of Queensland, Australia, they date back only some thirty years, but in that short time this province has added to the wealth of the world some £40,000,000. The rush to Gympie was the real beginning of the golden era, and the mines of Queensland are still producing annually gold to the value of two and a quarter million pounds sterling. No colony of Australia equals her in this respect, save Victoria, but the average yield for those engaged in the mining industry in Victoria is much less than in Queensland. The colony is said to possess large deposits of copper ores, and less extensive, but equally rich, silver and tin lodes, undeveloped, only waiting transportation facilities and the active hand of man to bring them into the range of competition and transform them into productive mines. Many of the metals and minerals, and most of those of large commercial value, together with several varieties of the more valuable precious stones, have been found within the borders of the colony. Charters Towers, with underground workings nearly 2600 feet in depth, Croyden, Palmer, and some half-dozen other localities, have become more or less well known to the mining world, but Crocodile is the most interesting field, and Mount Morgan is the property whose phenomenal gold production has most excited the wonder of all. This article, giving the story of the mining locality, and some description of its peculiarities and characteristics, has been mainly condensed from Australian mining papers and some other publications relating to the same subject.

On July 13th, 1882, Ned and Tom Morgan, with Sandy Gordon, an employe, set out from Rockhampton, with horses, on a prospecting expedition. They were to visit and examine a section known as Nine Mile creek, where Sandy said he knew of a silver lode. They arrived at the place on Friday afternoon. The next day they carefully searched for the silver lode, but without success. Shafts were sunk on the spots indicated by Sandy Gordon, and trenches were cut across several reefs, but nothing was found save a few specks of gold. With the night came a great rain storm, and in the morning, wet, disappointed, and generally uncomfortable, they set out to return home. They were obliged to swim the blind gullies, now running floods, and by noon had only been able to reach an old hut near the junction of Dairy creek with the Dee. Making a huge fire, they dried their clothes and cooked some food as well as conditions would permit. After eating, Ned Morgan, taking Sandy Gordon with him, started out to prospect the neighboring gullies until nightfall. Searching as they went, they crossed a range, and, coming down a gully, Morgan noticed a large black boulder. Knocking off a piece, and, seeing that it contained some mineral, he put it in his pocket. A little farther on he found a similar stone, and took a piece of that as well. Many of these large black boulders were seen around, apparently coming from the mountain above. Sandy Gordon was unaware of what Morgan had noticed, and he was not told of it. Owing to the fog and mist, they were only able to see a little distance, and it was with great difficulty that they found the way out and succeeded in again reaching the hut. Ned Morgan having told his brother what had occurred, the two crushed the stone and washed it out in the creek on a shovel. There seemed more gold than stone. The yellow metal was so abundant that they doubted its being gold. At 6 o'clock the next morning they made a camp upon the mountain. For several days they prospected, finding plenty of good stone, and washing now and then a panfull. Then Sandy Gordon was sent home with samples of stone for their brother, Fred Morgan, to test. Sandy got on a spree at a public house on the trail and did not return. Two days after the brothers returned to Rockhampton, and found that each sample brought with them was very rich in gold. Samples sent to Gympie for assay showed 3700 ounces of gold to the ton. The three brothers returned to the mountain camp, continued prospecting for several days longer, and then took up all the ground they could. For several months nothing was made known of the discovery. At the end of that time they took out samples from all the places they had worked. Some were given to T. S. Hall, manager of the National Bank of Queensland, and following this a partnership arrangement was made between the Morgans and Messrs. Hall, D'Arcy and Patterson, and steps were taken for the development of the ground. Thus was discovered and operations were first undertaken upon what was to become the greatest gold mine of Australia, if not the world.

After a time the various Morgan interests were purchased by the holders of the other half interest, for amounts aggregating some £75,000, and a limited company was formed, with 1,000,000 shares of £1 each. The total area of ground held by the company was 730 acres, and included the whole of the Ironstone mountain, to which and to the mine has been given the name Mount Morgan.

Ironstone mountain was known for many years prior to its development into a great gold mine. It was in the midst of the many alluvial diggings scattered over the Dee range, and often and again had old diggers crossed its top or followed around its skirts, seeking new patches of pay wash. Little did these fellows dream, as they passed over the rugged sides and ironstone boulders of the hill, of the wealth beneath their feet. It avails them not now to recall these facts, save to accentuate the sad refrain, "it might have been." A portion of the property had been taken up in 1864 as a cattle run by a brother of Sandy Gordon. He met with very poor success, however, and, losing most of his cattle in the dry season of 1876–'77, left his holdings. Afterwards the Morgans paid Gordon £1 per acre for what was considered a worthless right to the abandoned run.

The peculiar geological characteristics of the mine are puzzling and have given rise to a number of speculative theories as to the formation of the deposit. The mine is in many respects one of the most wonderful of gold mines. The deposit fills a crater-like basin capping a hill originally rising some 500 feet above the surrounding tableland, the most valuable portion forming the actual crown of the hill, a mass some 900 feet by 500 feet. The mine has been worked open-cast, or in quarry-like fashion, to a depth of 160 feet below the summit, over an arc 700 by 300 feet. The ore is a brown hematite containing some silica, and passes gradually into a ferruginous silicious sinter. Some of the ore is spongy and frothy in appearance and of very light weight. Both the ironstone and sinter contain gold, which is fine and disseminated throughout the rock. The underlying rock is a quartzite full of fine pyrites poor in gold.

The frothy silicious sinter is similar to the geyser deposits of Iceland and New Zealand and the hot springs of the Yellowstone Park, and the theory of the Government geologist of Queensland is that the deposit is the product of a geyser of enormous proportions, which carried chloride of gold dissolved from iron pyrites, oxide of iron being present in sufficient quantity to perform the function of precipitation, which may also have been aided by tannic acid derived from vegetable matter in the basin.

Another theory that has obtained currency is that the mass was the gossan of a large body of pyrites at a lower level.

Mr. Rickard's theory is that the auriferous deposit is rock shattered by the intrusion of dikes and then altered by the percolation of underground mineral solutions, which found easy passage through the cracked and broken material, the gold possibly being derived from the poor pyrites disseminated through the underlying quartzite, or the sandstones of the district, which have been proved to be auriferous.

Mr. C. S. Wilkinson considers the country rocks metamorphosed stratified rocks, containing pyrites disseminated in small quantity. They are pierced by dikes of granite and dolerite. Water percolating the pyritic strata in the neighborhood of these dikes, the dolerite became kaolinized and the pyrites decomposed, the gold being deposited and redeposited along with oxide of iron produced from solution of the pyrites.

In the matter of metallurgy, a satisfactory method of working the ores was only arrived at after much costly experimenting and unremitting effort. Mr. J. F. C. Johnson states that when he visited the mine the ore was fed directly into roller mills. After crushing, it was delivered to the roasting furnaces, and thence passed to the chlorinating sheds. The chlorination works are the largest in existence. Very large vats are used. Chlorine is applied as chlorine water, the consumption, it is thought, being thus far better controlled and kept down to that required for the extraction of the gold. The use of chlorine of lime and sulphuric acid has been superceded by manganese salt and sulphuric acid, and the installation of chlorine stills, towers and solution tanks. The percentage of gold extracted is 95 per cent of the assay value, and the gold is the purest yet found anywhere, containing 99.7 per cent pure gold, the rest being copper, with traces of iron and silver.

The mine was opened in 1886. It has produced upwards of $30,000,000 and has paid enormous dividends. Up to 1896 the shareholders had divided among themselves forty-three and one-half tons of standard gold. In 1896 the dividends amounted to over 34 per cent of the paid up capital. In 1897 the yield, based upon the ore worked, was $30.29 per ton, and the total working expenses $12.53 per ton. The heaviest items of cost were for labor and fuel. Total expenses were 41.5 per cent of returns.

The value of the ore has decreased from 5.8 ozs. per ton in 1887 to about 1.5 ozs. per ton. The average value of ore worked to May 31st, 1895, was 2 ozs. 13 dwts. 5 grs., equal to about $53 per ton. The highest value seems now to be in the mundic or pyritic ore, which, in the year ending May 31st, 1896, averaged 3 72 ozs per ton, while the ordinary ore gave 1.12 ozs.; value per ounce, $19.92.

The mine is continuously a great producer and gives every present promise of remaining so. The story of Mount Morgan is only one of others which could be told, of the extraordinary results frequently obtained in this one branch of mining alone. Equally astonishing results have been obtained in the production of other minerals and metals, so that there is little wonder that mining is fast becoming to thought one of the most fascinating pursuits offered to mankind. When we consider the very great diversity of the metals, minerals and precious stones of large and growing commercial value, and the constantly increasing demand, desire and even necessity for these things, and the further fact that many of the best minds of the age are steadily at work improving all the metallurgical and mechanical aids to successful mining, and simplifying and lessening the cost of all the practical operations connected therewith, who will undertake to foretell the possibilities of the future of this great industry?

The Solvent Powers of Cyanogen.*

Written by WM SKEY.

The gold in the test paper used in the experiment volume for volume, only weighs half as much as hydrogen gas. Broken up in this manner in the test paper, it is in very truth fine gold; in fact, gold divided almost to its ultimate atom (if, indeed, atoms do exist)—gold in the cloud form, as it were, and therefore in the best condition I know of for my purpose. Provided with a test so delicate as this, we get results in an hour that, using the gravimetric test for loss, would require several days, and so we avoid those errors that are apt to creep in and vitiate our results when long periods of time are required for experiments of this nature. Placing then, in a porcelain vessel a strong aqueous solution of cyanogen, along with a little of this gold test paper, I closed the vessel down airtight, and on examining at periodic intervals I found that even after the expiration of six hours, corresponding to sixty-two days for gold leaf, there was no visible diminution of the color of that test paper. After this, however, the tint gradually faded, until in thirty hours it had quite disappeared. Thirty hours to dissolve the millionth of a grain of gold so finely divided as this grain was shows that if cyanogen itself does dissolve gold, it is only at an extremely low rate—at such a rate that ordinary gold leaf would require about one year to become entirely dissolved therein. The cyanogen I used, though very carefully prepared, has a slight acid reaction; it contained traces of ammonia, hydrocyanic and hydrochloric acids, and this even when, to avoid producing them, I used the protochloride in place of the bichloride of mercury. And I may further state that the solution of this cyanogen kept persistently acid even when it was three weeks old and much of the gas decomposed; and, what is more singular still, the solution was much more solvent of gold at that time than just after it had been made. It was, therefore, apparent to me that it is not *any* degree of acidity in a cyanogen solution that does, as is now supposed, conserve this gas. It is not a mild acidity that is always effective for this purpose. So I increased the acidity of the cyanogen solution by adding to it a few drops of hydrochloric acid, and tried another gold test paper therein, when I was unable to detect, even after the lapse of seven days, the slightest change of tint had been produced upon the test paper. Hydrochloric acid had not any retarding effect upon the dissolution of gold in weak solutions of bromine.

That cyanogen would have very little tendency to form by its decomposition solvents for gold as used upon quartz, etc., at the gold mines appears to me absolutely certain, as both air and water are generally acidic, and all the reef quartz I have yet tested also gives an acidic reaction.

I will give a few notes respecting the cyanodizing of gold, etc., in anticipation of papers I am now preparing on the subjects:

NOTE 1.—Very fine granular gold, such as that in these papers, or that prepared and described by Professor Faraday, requires far more time (weight for weight) to dissolve in potassic cyanide than solid gold, such as gold leaf, the former taking fully a hundred times longer than the latter, and this though the extent of its superficies is comparatively greater. This fact leads me to suppose, as the only explanation thereof, that the metal, as it exists in the ruby form on the paper here, is in a different chemical state from that of ordinary or massive gold—that is, this gold is in an allotropic form.

NOTE 2.—Gold leaf placed upon the surface of a strong cyanide solution is whitened throughout before all being dissolved therein. The white film resulting is only very slowly soluble, but if the solution of the cyanide is weakened a good deal the film rapidly dissolves. This film is a cyanide of gold, and its presence under these circumstances confirms the correctness of a statement of mine that in the cyanide process the cyanodizing of the gold is not always, if indeed it is ever, simultaneous with dissolution—that, in fact, the latter process often lags considerably behind the former process.

NOTE 3.—Gold leaf as on the surface of a weak cyanide solution is at first strongly positive to the same kind of gold leaf as immersed in this solution, but it very shortly becomes negative thereto, and remains so until dissolution breaks the voltaic con

*Condensed.

on. The singularity of this circumstance is us when we consider that gold on the solution more rapidly attacked by cyanide than is gold is beneath the surface. This is an interesting hat requires explanation.

TE 4.—Kerosene, gasoline and hydrocarbons rally, when placed over gold leaf that rests on surface of a cyanide solution, do not sensibly fere with the dissolution of that gold, if only en has free access to the hydrocarbon used. result shows, first, that the rapid dissolution of leaf as placed on the surface of cyanide solu- is not in part due to the action thereon of 'air ic circles,' as is stated by Professor Faraday, tmosphere itself being cut off; second, that hydrocarbon oils are pervious to air, or at the oxygen of it; and, third, that a very minute tity of oxygen is as effective for promoting or ting towards the rapid dissolution of gold leaf ng on solutions as is an unstinted supply of it.

Hydraulic Mining.*

NUMBER V.

e Discharge Pipe or Nozzle.—To that part of the aulic apparatus connected with the final dis- ge of the water through nozzles various names been applied, such as the "goose neck," be monitor," "dictator," "deflector," "knuckle ," "little giant," etc.

hile certain of these names are suggestive of e property, feature or other peculiarity of the hine, more of them would seem to have no spe- significance, although for each of these devices nventor has claimed some peculiar merit, and always without reason, only a few of the entire ber are now in much use.

or the information of those not posted in these ters it should be explained that, in miners' par- e, the terms monitor, nozzle and giant mean all same thing, they being applied to these several hines indifferently, and in the case of the nozzle improperly, as this is only an appendage of the aratus, being only the projecting tube or nose ugh which the water makes its final escape. re is need for a specific name for these discharge s, which should designate and be confined to portion of them by which these movements are cted and controlled, and thus the present confu- be avoided.

hese pipes range from 4 to 9 inches inside diame- the quantity of water they are capable of dis- rging varying from 300 to 1500 miners' inches, rding to size, pressure, etc. They can throw an ctive stream on a gravel bank 200 feet away. quently as many as four, and even five, of the est sized machines are played in a single pit at same time, each machine discharging from 1500 700 cubic feet of water per minute. Notwith- nding the force of one of these large jets of water, ndurated or so tenacious are some portions of the vel to be washed that it has to be shattered with er preparatory to playing the water upon it. force of a large stream of water as it issues n one of these nozzles is hardly less than that of annon ball at the instant of its discharge. When rated the machine is brought as near the bank as compatible with the safety of the pipe man, in er that the full effect of the jet may be obtained. en the bank is very high fatal accidents some- es occur through its sudden caving. When much r 100 feet in height the bank is piped off in ches as a safeguard against accidents caused by se caves.

When it is said that a full set of the largest of se machines, as we sometimes see them operat- in the hydraulic mines, is capable of perform- the work of 1000 men, the remark is to be derstood in a literal sense.

Bank Blasting.—When the material to be piped off o hard or so tenacious that it cannot be readily oken down and disintegrated by the stream of ter thrown upon it, recourse is had to powder for complishing that end. So, too, when the gravel nk is dangerously high, it is to be blown up with wder. The preliminary work required for this rpose consists in running suitable drifts under the nk to be blown up, charging the same with pow- r and laying the fuse, after which the main drift to be thoroughly tamped. The drift is run in on e bottom from the face of the bank, a distance pro- rtioned to the height of the latter and the nature the ground to be blown up, the quantity of pow- r used being determined by the same conditions. a rule, the length of the main drift should be out three-fourths the height of the bank, if this considerable. From the inner extremity of this ift a crossdrift is driven each way, forming a T;" or, if the quantity of powder to be used is ry large, the ground being heavy, two or more of ese crossdrifts are to be driven. Each arm of the ain or terminal crossdrift should be from 40 to 50 feet long; of the others, about 30 feet. When the bank has an extended face and only moderate depth, several parallel drifts may be run, or as many as conditions seem to require, their length being proportioned to the depth of the bank. In all cases the length of both the main and lateral drifts must be in proportion to the extent and nature of the ground to be shattered, both of which, therefore, should be carefully studied in advance. The main drift should be as small as can be conveniently driven, say 3 feet wide by 4 feet high, the crossdrifts being a little larger. Sometimes instead of carrying in the main drift from the face of the bank it is extended from the bottom of a shaft sunk for the purpose. Occasionally short drifts called "lifters" are driven at right angles to the crossdrifts, from the ends and centers thereof, these "lifters" being carried back toward the face of the bank.

For blowing up shallow banks or patches of bottom gravel shafts with a crossdrift at the bottom, or having the lower part enlarged, giving the shaft a bottle shape, are employed. These are tamped and fired in the same manner as the horizontal drifts The shaft, when the bank is not extremely high, answers about as well as the drift, and possesses the advantage of being much more easily tamped than the latter, as the material used for this purpose, being that excavated in sinking the shaft, has to be simply shoveled in.

The quantity of powder usually employed on these occasions varies from 100 to 200 kegs to as many thousand, each keg containing twenty-five pounds. The minimum quantity required varies from sixteen to twenty pounds for every thousand cubic feet of ground covered by the drifts. Small blasts, other things being equal, require more powder in proportion to the ground than large ones. Thus, if 500 kegs of powder will break up from 40,000 to 50,000 cubic feet of gravel, 1000 kegs may be expected to reduce 120,000 cubic feet to a like condition. It is calculated that a successful blast will prepare double the area of ground covered by the drifts. As nearly as can be estimated there should always be enough powder to thoroughly shatter the bank, an excess being better than a deficiency. Two-thirds of the powder used should be placed in the terminal crossdrift, the balance in the other crossdrift. Where the drifts are dry the powder may be emptied in long boxes, or be left in the kegs, their heads having been removed. If there is water in the drifts or shafts the powder must be put in water-tight boxes, the lids being pierced with holes to admit the fuse, after which having been introduced the lids must be fastened on firmly and the holes closed with wax, putty or other substance impervious to water.

After the boxes or kegs of powder have been placed in rows and covered with paper, the electrical wires are extended along them. The exploders are inserted in giant powder cartridges extended along on top of the paper covering the powder. The wires laid in the lateral drifts are then connected with those extending along the main drift to the electrical battery. If fuse is to be used for exploding the charge, it is here properly put in place—for the sake of greater security two or three lines being laid. In the center a layer of heavy rock is placed, forming the basis for the filling in or tamping, the material removed in excavating the drift being employed for this purpose. It should not be too damp, and, if present, all very large stones should be thrown out, as they may cause serious damage and perhaps injury to persons should a "blow-out" occur. Sand and fine gravel make the best tamping material. The tamping, jammed in with wooden rams, should be thoroughly done, so that it will not settle, leaving a space between it and the roof of the drift. Sometimes a barrier of timbers is placed across the main drift at the intersection of the first crossdrift prior to the former being filled in.

For several years, at first, common blasting powder was used in blowing up these gravel banks. Gradually, however, this has come to be almost wholly superseded by the use of a low-grade giant powder. For blasting boulders, trunks and stumps of trees, lava, pipe clay, hard bottom, cement, etc., nitro-glycerine explosives are employed.

For firing the charge, both the common and electric fuse are in use. When the latter, one should be inserted for every forty or fifty kegs of powder, as this insures simultaneous ignition and complete combustion of the powder, whereby its entire force is usually developed. The firing is usually accomplished by means of a high-tension electrical machine placed at a safe distance from the mine and connected with the insulated wires.

The Derrick.—For handling the larger boulders a derrick, operated usually by a hurdy-gurdy wheel, is employed. When, as occasionally happens, a boulder is encountered too large to be raised by the derrick, it is broken up with nitro-glycerine or giant powder into fragments so small that the derrick can lift them and swing them around out of the way, some of these machines having a lifting capacity of ten tons or more. The larger class of these structures have a mast 100 feet high and a boom 92 feet long. The mast is supported by guys of 1-inch wire rope, a whip block with ⅞-inch steel rope being used for hoisting tackle.

The guys, six in number, are held by double captstans. Where the derrick is to be moved but a short distance, as a hundred feet or two, this is usually accomplished with wooden rollers and without being taken down.

Begun in issue of Dec. 18th, '97.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER I.

By GEO. F. BECKER.

Exploitation on the Witwatersrand has hitherto been confined almost entirely to what are known as the outcrop properties and to depths of less than 1000 feet. These upper workings have been elaborately described, the most recent and thorough descriptions being by Messrs. Carl Schmeisser, Hatch and Chalmers, C. S. Goldmann, and L. De Launay. Within a year some of the deeper shafts on the Deep Level properties have reached the ore-bearing strata. The deepest shafts are, I believe, those of the Robinson Deep, close to Johannesburg. On this property No. 2 shaft cut the South Reef (or the highest of the important conglomerate beds) in July, 1896, at 1806 feet. At the point encountered this reef assayed three ounces over a width of 12 inches. In March, 1897, No. 1 shaft cut the South Reef at 2385 feet and found it assaying five ounces over a width of 6 inches. A bore hole called the Bezuidenville has cut the reefs at 3251 feet from the surface and 5800 feet from the outcrop, finding them auriferous. This bore hole is close to town and directly south of the Meyer and Charlton. The Rand Victoria bore lies some five miles to the eastward of the Bezuidenville and at 4100 feet from the croppings. It cut the first reef at a depth of 2343 feet, where it assayed one ounce four pennyweights.

There is little doubt that exploitation on the Witwatersrand can be pushed to a depth of 5000 feet. There is no indication that heavy ground or unmanageable quantities of water will be met with, and while the data as to temperature increment are thus far very unsatisfactory, they indicate only a rise of 1° F. for from 82 to 100 feet of depth. A careful scrutiny of the conditions leads me to believe that there are no serious natural obstacles to mining in this region at 4000 feet, nor, under proper management, would there be any excessive unavoidable expense. Whether the deposits will remain remunerative at such depths is a separate question.

The future of the Rand is a more important matter than its past. Whether or no the gold-bearing series will continue to carry profitable quantities of the precious metal, and whether they will turn out to be productive when followed on the surface to greater distances from Johannesburg, are questions the answers to which must be deductions from the true theory of the genesis of the deposits. The discussion of gold deposition on the Witwatersrand is a very responsible task, for an error in the conclusion might easily lead to lamentable disasters. It should, therefore, be undertaken in a thoroughly dispassionate spirit. I shall begin by marshaling the facts, so far as I have been able to ascertain them, and then review the theories which have been advanced to account for them. Some of the analogies to be drawn require more details as to other deposits than it is convenient to give in discussing the Witwatersrand pudding stone, and these will be given by themselves in a separate division of the paper.

The Gold-Bearing Region.—Before entering on the details of the occurrence of gold in the great deposits about Johannesburg, it may be well to glance at their general relations to the auriferous regions of southern Africa and to sketch, in barest outlines, their geological position; for these general relations will contribute somewhat to a comprehension of the conditions under which the deposits were generated. It must be understood, however, that the stratigraphy of the region has not been thoroughly worked out, and that, though a number of geologists and mining engineers have studied some questions, the information has for the most part been gathered for the benefit of companies to whose interest it is to withhold information. Partly as a consequence of these conditions great differences of opinion exist among those who have given public expression to their views.

A large area in South Africa is known to be auriferous; indeed, there is a strong probability, as has often been pointed out, that the Ophir of the ancients was in Mashonaland. The area to the northward of the Transvaal which is dotted over with proclaimed gold fields may be estimated at 75,000 square miles. The gold fields of the Transvaal cover about 55,000 square miles. It is quite possible, of course, that there are other undiscovered fields within or without this region. Johannesburg, Heidelberg, Pochefstroom and Klerksdorp lie at the southern edge of the auriferous area. These are also the only districts in which the gold is found in conglomerates, all of the more northerly fields being characterized by veins not dissimilar to those of other gold-bearing regions, such as California and Australia. They are usually associated with schists and granitoid rocks.

(*To be Continued.*)

Mining Summary.

CALIFORNIA.

Amador.

J. J. Davis and R. L. Marsh, at French Camp, are opening a property with good results. There is enough ore in sight to warrant building a 10-stamp mill, on which work has begun.

Record: The Argonaut crushes 120 tons a day. The ore yields an average of $15 per ton.

Little is doing at the Bellwether beyond keeping the water out.

The Potazuba, at Sutter Creek, is down 550 feet and drifts run on the ledge. The ore, while low grade, is of a promising nature, increasing in value.

The *Record* says it is reported that S. C. Wheeler has disposed of his mine to a company of Salt Lake City people, who purpose the enlargement of the mill and erection of up-to-date hoisting works.

Machine drills have been added to the equipment of the Amador Queen No. 1 mine. The shaft is down 800 feet.

The shaft at the Amelia is down 450 feet. Supt. Reese says they will carry it to the 1000-foot mark before crosscutting.

Butte.

(Special Correspondence).—Two miles above Dogtown a gravel property is being developed. A Boston corporation is working it. They have a tunnel in 1000 feet, cutting into an ancient channel. The incline runs through 200 feet of gold-bearing gravel that runs from $4 to $15 per car. This is from testimony given under oath. A piece of gold was found that weighed $800. The company owns 320 acres. The tunnel has not reached beyond the rim rock very far; consequently, at present writing, it is not known how wide it will prove. It is known as the Alki mine. C. B. Frost is Mgr.

Chico, Jan. 11th, '98.

Several men have been working the tailings from the Katskill gravel mine, near Bangor, and made fair wages.

The Oroville *Register* says two men, after ten weeks work near Enterprise, took out a beer bottle full of gold.

Calaveras.

A local report is to the effect that the Gwin mine has passed under the ownership of the Gwin Mine Development Company by the recent payment of the four years' bond of $200,000, which would not have expired until December 31, 1898. The original amount agreed upon for the property was reduced by the payment of royalties, and a rebate of $21,500 made by the late owners, the heirs of Senator Gwin, to about $146,000.

The Jupiter Gravel Mining and Water Company has levied an assessment of 20 cents per share, delinquent February 10th.

The case of the Lightner M. Co. vs. the Utica M. Co. was filed in the Superior Court last week. The action was brought to recover $250,000 and costs.

At the Tracy mine the shaft is 65 feet. The intention is to go 400 feet before doing any crosscutting. F. Brandt is Supt.

The Stickle mine and mill, says the *Echo*, closed down for want of water, and the report is current that if rain does not come soon the Utica will also have to close down.

The Cross shaft has reached 1250 feet and sinking has been suspended for a time. Stoping will commence shortly.

El Dorado.

(Special Correspondence). — At the Grand Victory mine, the mill, which has been idle for several months, started last week. It is generally understood here that the English company who bought this property and have made a payment upon it, will carry out their contract and complete the purchase.

At the Griffith Consolidated the new hoist, capable of 1500 feet, is in successful operation. The development work is very encouraging in its results.

At the Larkin the 5-stamp mill is steadily running and the mine is improving as development work continues.

The Selby has ceased work. This is supposed to be only temporary, until new stockholders become interested.

After several months of idleness the Big Sandy mill is again running.

The Lone Star group, which is under bond to Thos. Clark, is showing some good ore, and development work is proceeding favorably. This is a new property situated about five miles east of here. At the Boulder they have drifted 243 feet east and west on the 700 level, and in all this there was not a barren spot. From the 700 level the company is sinking a winze. They find that the deeper they go the better the mine proves itself. The cost of mining and milling the ore at the Boulder is about $2.40 per ton. The returns in the Boulder are quite satisfactory to the owners. This property is doing much to show that what is required in El Dorado county to prove it a good mining section are capital and depth, S. C. Wilmans, Rescue P. O., is Supt.

The Try Again hydraulic property, 2½ miles east of town, comprising 438 acres, is awaiting the thawing out of the El Dorado Co.'s big ditch to begin operations. This is a new property so far as the present method of working it, though in sluicing it has in parts produced coarse gold. The unusually cold weather here, unaccompanied by snow or rain, has been a complete hindrance to gravel mining in this section. The Try Again will have 800 inches of water under a pressure of 370 feet. The company is composed, I am creditably informed, of Oakland and San Francisco men of means, who will give this ground a thorough and systematic test. F. W. Cook is local manager.

Placerville, Jan. 10th, '98.

The Sunrise, near Kelsey, after cessation of work for a year, began development work which they intend to prosecute.

Work at the Grizzly Flat gravel mine, of which A. A. McDonald is Supt., is progressing. The ten stamps are running steadily.

W. R. Pearson is thoroughly developing the Mt. Hope at Grizzly Flats.

Nugget: W. F. Lupold, at the Rosebud, near Brownsville, struck ore that goes from $40 to $50 per ton, and the indications are that it will last.

S. A. Lane is taking out some high-grade ore at his mine in Omo district.

Kern.

The surfacing of the Kramer & Randsburg Railway will be completed to-day and the road turned over by the construction company.

Near Randsburg the G. B. mine, Stringer district, has been bought by Koehn & Jewett for $35,000, one-third to be paid Jan. 20th, the balance in thirty, sixty and ninety days. Ore is being hauled to Kane Springs for milling.

H. R. Bacon purchased a half interest in the Republic mine for $600.

J. R. Parker had three tons of ore from the Juanita milled, which produced $50 per ton. His shaft is 80 feet.

Ore from the Yellow Aster is crushed at the Pioneer mills.

Work was commenced on the cyanide plant this week under the direction of Dean & Brand.

Californian: F. K. Wilson of Randsburg deposited $38,680 in payment of the Butte mine, Randsburg. There were several payments made before, amounting to $20,000.

Lake.

A press dispatch from Lakeport says that ore assaying $5672 in gold and $90 in silver to the ton has been discovered two miles from Adams' Springs. If the first two figures are left off the story may be worth notice.

Los Angeles.

The San Bernardino *Sun* announces that the Gold Bronze mine and mill were sold at receiver's sale to the J. M. Hale Co. of Los Angeles for $4470.35. This represents merely the claims which were a first lien on the property. The total amount of indebtedness was $28,000, but the secondary claims will be unprovided for, unless the others take the plan of redeeming within the statutory six months.

Madera.

(Special Correspondence). — The Spencer mine on French Gulch, Fresno river, is running a 10-stamp mill continually on ore reported to be worth $20 per ton.

At the Gambetta two shifts of six men each are doing development work. The ore is crushed in a Huntington mill.

Twelve men are employed at the Lucky Bill mine.

Some rock running over $600 per ton has been struck in the Wagener mine, situated on the road from Raymond to Coarse Gold. The mine is owned by Shaw Bros. of Raymond and the ore is worked in two steam-power arrastras.

At the Last Chance mine, Fine Gold district, an adit level is being run to tap the bottom of an old shaft in order to afford drainage. The level is now in over 250 feet and will extend about 100 feet farther. Four men are employed. When this drainage tunnel is completed the work of extracting ore will begin.

Mariposa.

(Special Correspondence).—Martin J. Heller has bonded from the estate of Andrew Olcese the Francis mine, situated about seven miles southwest from the town of Mariposa. The bond runs until June 30th, '99, and the consideration, which is not made public, is understood to be in the neighborhood of $20,000. Mr. Heller also examined the old Compromise mine, better known as the Marble Springs, on the north fork of the Merced river above Coulterville, with a view to taking hold of the property. He is understood to be acting in the interest of Mr. Mackay and his associates.

The Merced mill at Coulterville was closed down on the 10th, pending the improvements at the Mary Harrison mine.

The Mariposa Commercial and Mining Co., owners of the Mariposa Grant, which comprises 44,000 acres and covers twelve miles of the mother lode, has levied an assessment of $5 per share, delinquent Feb. 11th next. Considerable activity is manifested among those locally connected with this property, and the regular rumors of an impending start up are going the rounds again.

A. Wartenweiler and C. A. Molson examined the Red Banks and Crown Lead properties last week.

Mariposa, Jan. 11th, '98.

Nevada.

The machinery on the Phœnix at Nevada City has started and works to perfection. Supt. Shockley is pushing work in reconstructing this long-abandoned property.

Telegraph: Good reports come from the mines at Brown's Valley, especially from the Pennsylvania, where they have a 9-foot ledge, a crushing from which yielded $4 per ton.

Transcript: The shaft at the Texas is 160 feet. The work is progressing under Supt. McFall.

At the Mountaineer Supt. Dennis started the mill last week.

The last crushing from the Wisconsin at Grass Valley paid $44 per wagon load.

The Mistletoe mine, near Rough and Ready, is a good grade and is being rapidly developed.

Union: C. Cleveland sold his quartz property adjoining the Kirkham mine to La Suerte Co.

Transcript: The shaft of the Stanford has reached 340 feet. The north drift is being extended, and the prospects are encouraging. Supt. Thomas is making good headway. J. H. Neff and others are developing this under bond.

H. Goering has nearly forty tons of ore on Round Mountain. It is heavily sulphuretted and gives good returns.

Colfax *Sentinel*: The Red Dog M. Co. has a permit to mine by the hydraulic process. The restraining dam will be located one-half mile below You Bet station. Work has begun on the dam. It will be 40 feet high and 170 feet long.

Union: A 2-foot ledge has been struck in the lower tunnel of the Delhi, near Columbia Hill.

Placer.

On the Bellvue mine at Ophir the vein is from 2 to 3 feet and the shaft is 80 feet.

The Supervisors appropriated $750 for the Golden Jubilee Mining Fair.

The annual meeting of the Eureka Drift M. Co. was held last week. The following were elected directors for the ensuing year: F. Chappelet, F. A. Leach, H. P. Dalton, C. E. Colton and A. E. Bolton. The company is in good financial condition and has ample funds for the completion of development work. It is thought that by next May they will be washing the gravel from the deep buried channel.

The Maus mine shaft, near Forest Hill, is down to the 100-foot level. It is double compartment. A 10-H. P. hoist is used. The New Austral Co., Ltd., of Paris, France, is interested. S. Roumage is Mgr.

Sentinel: At the the Bartley Con. drift mine at Dutch Flat the main tunnel, running with the channel, is 1150 feet. At 400 feet a crosscut 350 feet shows no sign of the rim. The mine comprises 110 acres of channel. The gravel from the main tunnel and crosscuts pays for the development work. W. Rablin, one of the owners, is superintending the work.

The 10-stamp mill at the drift mine of the Gold Run Gravels Co. at Gold Run was started last Monday.

Riverside.

At Eagle Mountain district, besides the several quartz ledges opened up, work is progressing in Placer canyon, three or four miles in length. Some of the men are said to average an ounce a day.

San Bernardino.

The Victor M. Co. is working a large force of men at Oro Grande. A new mill has been completed.

San Diego.

(Special Correspondence). — The Helvetia mine, near Julian, is still supplying its mill with its full capacity of rich ore.

The first of January transfer of ownership of mining claims in this county was decidedly active. Everything believed to be good, upon which assessment work had been omitted or neglected for '97, was properly cared for by some one who had kept an eye to labor expenditures the year through. In some instances of the more valuable properties, two or more different parties were on the ground with the same intent at the same time.

The "mill crushing" of ore from the Mountain View mine, in the Julian district, recently made, gave a yield of over $100 to the ton. The directors of the company have let a contract to sink a shaft 100 feet, preparatory to more active development in the spring. The work is now being executed and some fine rock is being taken out.

The Ranchita mine, near Banner, has secured the services of Mark Lamb of San Diego in the capacity of assayer and metallurgist. The mine is a constant producer.

Julian, Jan. 10th, '98.

Sale was made of the Dale group, Virginia Dale district, to the representative of an English company. The mines will be developed. It is said that the ore assayed $30 a ton. The price is reported at $45,000, which includes a small mill, buildings and 1000 tons of ore on the dump.

A mortgage on the mines of the Sweetwater M. Co., on the Colorado river, to Julius Wolff for $10,000, was released last week.

Supt. Clark of the Stonewall mine at Banner has been prospecting the tailings deposited by that mill, and is convinced that enough money can be made from them by the cyanide process to possibly pay off all claims against the property. The Cuyamaca lake is so low that prospecting can be carried on where hitherto it was impossible. There are many thousands of tons of tailings, estimated to run from $3 to $5 per ton.

Shasta.

The California Con. Iron mines, on the McCloud river, have been surveying for a patent. Five men have been developing the property. R. Radcliff is Supt.

Another ledge of base ore has been discovered in the Backbone mining district. The ore body is 65 feet wide and assays $7 per ton in gold and silver and 2½ per cent in copper.

Courier: The Texas Con. Co., at Old Diggings, is reported in financial troubles. A chattel mortgage and bill of sale are recorded, transferring the mine, store and stock of goods to E. J. Sittig and W. J. O'Donnel, who represent fifty employes. The store is to be conducted for the men as preferred creditors, and the surplus will go to the Joshua Hendy Machine Works in San Francisco. The mortgage is to secure promissory notes for $12,000 for labor.

Ormsby & Berger are getting good ore near South Fork.

E. L. Ballou is getting out ore on the Hope and Manzanita claims.

Press: W. Forstner, of New York, has secured a bond upon the Mammoth group three miles west of Kennet.

Searchlight: The Brown Bear at Deadwood gives employment to fifty men more than at any one time for three years. For the first time in two years the full seventeen stamps are employed on company ore.

Sierra.

The All Nations Co. secured a permit to extend their tunnel under and across upper Main street in Downieville.

Siskiyou.

Journal: Miners along the Klamath, expecting to start up work in their hydraulic claims, have not been able to do so yet, owing to lack of storms. The quartz mills at various points are starting again, having closed in consequence of cold nights freezing the water in the batteries.

The Chinese Co. continue to find good pay on bedrock. They are working a steam derrick and making $40 a day.

At the Greenhorn Blue Gravel the gravel is paying $1 to the tub and 160 tubs are hoisted each shift.

The Hegler mine is being prospected for Colorado men.

Tulare.

Ore has been struck in the shaft on the Comet at White River at a depth of 110 feet, which prospects $125 to the ton. The ledge is 8 inches wide.

Trinity.

Matthews & Warner at Hayfork are running a tunnel to tap the ledge.

A quartz boulder weighing thirty-five pounds was sluiced out of the Hupp & McMurry, Weaverville, which is rich in gold.

The La Grange Hydraulic Co., a French corporation, is operating on 3174 acres four miles from Weaverville. The gold-bearing gravel varies from a few feet to 300 feet in height. A canal system 14½ miles long, 7 feet on top and 4½ at the bottom, 4 feet deep, carries the water during the summer, conveying 60 cubic feet per second.

To secure a permanent water supply during the winter season Rush creek and Stewart's Fork are being connected by a 9000-foot tunnel through the mountain, which will be completed about March.

Tuolumne.

(Special Correspondence).—On the Harriman the new hoisting works are completed. Sinking has reached 100 feet and will be continued to 400 feet before crosscutting is begun. F. C. Wilmans is superintending work on the Harriman, the Old Bonanza and the Rose Creek properties, making his headquarters in Sonora.

Jamestown, Jan. 10 '98.

A carload of ore shipped from the Black Oak yielded six ounces of gold and eleven ounces of silver per ton.

Six veins traverse La Estrella ground ranging from 12 inches to 12 feet. Assays from the main tunnel run $1.13 to $2.45, with 6 per cent sulphurets that go from $29 to $30 per ton.

Ventura.

Fires were started recently in the furnaces of the California Asphaltum Co., having been shut down three months to make extensive improvements.

Yuba.

The supervisors have established the water rates for the county for '98 as follows: For irrigation purposes the rate shall not exceed ten cents per cubic inch under 6-inch pressure, miners' measure, and for ditches and corporations owning their own water the rate shall not exceed the sum of fifteen cents per day under the above-stated pressure. For persons or corporations having to purchase water for the purpose of selling the same, twenty-four hours shall constitute a day, and for milling purposes twelve and one-half cents per inch per day and for mining purposes twelve and one-half cents per inch per day.

NEVADA.

(Special Correspondence).—D. H. Jackson of California, has deeded to the Holmes Mining Co., controlled by a London corporation, 160 acres of land, covering the townsite of this place, and upon which the railway depot is situated, together with the two Northern Belle mills, and tailings to the amount of about 250,000 tons. The assay value of these tailings is conservatively computed at $1,250,000.

Belleville, Jan. 9th, '98.

The Piocho *Record* says that J. E. Peck has returned to Bullionville. The last car of machinery was received there about two weeks ago. The Bullionville mill has been entirely remodeled. It now represents one of the concentrators of the Peck Bros. The particular method of treating ore by this process is secret. It is estimated at a capacity of 20 tons a day. The changes in the mill have involved an outlay of $30,000.

At Silver City, the Oest, Haywood, Success, Santiago and Canyon mines are all looking well. A clean-up from the Oest netted $15 per ton. The Canyon has a ledge of ore that mills $12 per ton.

Midgley, Roberts & Moran have relocated the old Cooney claim, twelve miles from Sutro, and given it the name of Lizzie mine. They have a 2-foot gold ledge that horns well.

Reports say that the Dumontelle is proving a valuable property. The ledge is 3 feet, and the ore mills $35 per ton.

The average output per week in gold from the Olinghouse mines, in Washoe county, is about $400.

Proctor & Norris are developing the Ore. The cold weather interferes with the mining.

Quinn & Taylor are running a tunnel at Olinghouse that will cut the ledge at 200 feet.

The Broncho shows 34 inches of low-grade ore.

To drain the Comstock and resume deep mining thereon would awaken a waning interest in the old bonanza that, unless something is soon done, will result in inanition.

The Yerrington *Rustler* says that F. J. Huffaker placed an attachment on the Peck mill at Dayton; the property is in the hands of the sheriff of Lyon county. Mr. Huffaker was acting in behalf of J. Douglass, to whom it is said the Pecks are indebted in the sum of $44,000.

OREGON.

The $750,000 deal for the Bonanza mine, near Baker City, is off. This deal involved a commission of $250,000, said to be the largest ever carried by a mining sale in the Pacific Northwest. The collapse is the result of a lawsuit over the division of the commission. The Bonanza mine was the property of the Geis

estate. Geiser gave an option on the mine for $500,000 to H. L. Phillips, who carried the property to New York and negotiated a sale for $750,000. The New York men bought the mine, paying $50,000 down. The New York buyers hesitated in the payment of the deferred installments on the purchase price. When the day had passed for the second payment, Geiser declared the deal off. He now says that the mine cannot be bought for less than $1,200,000.

Niven & Co. discovered a 3-foot vein of high grade ore three and a half miles above Granite.

Rich ore is being taken from the Mocking Bird, near Union. The average paid each day is $20. This rock is worked in a hand mortar and washed with the pan.

The *Republican* reports that the Crystal Palace group, at Union, has been sold to C. H. Thompson for $125,000. This mine has 3000 feet of tunnels.

At Baker City the Virtue mine is about to resume operations.

Supt. Turner of the Esmeralda group, Baker City, has started his mill. He has struck high-grade ore that had been overlooked by former operators.

A shipment from the 97 shows that the property is a high-grade proposition. The ore netted about $100 per ton.

Ten tons of ore from the Free Coinage, near Ashland, produced twenty-one ounces in gold. The concentrates went $150 per ton. The ledge is 3 feet.

W. H. Reed has purchased the Hammersly mine, southern Oregon, and is pushing work. The ledge is 2½ feet; the rock runs $75 to the ton.

W. J. Stanley has bonded the Homestake at Woodville to J. E. Frick for San Francisco people for $5000, and they will begin at once to develop it.

The first payment of $5000 on the purchase price of the Ashland mine was made Jan. 3rd.

The ledge on Browning & Hannum's mine is 2 feet and the ore averages $15.

P. Scheringson has a 70-foot tunnel near Grant's Pass on a 16-inch vein of $150 rock.

Samuel Barton and others propose to put in a copper refining plant at Portland, two stacks, each of 200 tons capacity.

WASHINGTON.

The Comstock M. Co. of Colville has begun work on Clugston creek. Supt. Earnest expects to be shipping the first of February. The character is silver and lead, with a small percentage of copper.

BRITISH COLUMBIA.

(Special Correspondence). — Twenty men have gone to Phillips Arm to do active development work on the Annie Laurie mine. Nothing more is heard of the proposed smelter. It is needed on the coast, as a large number of mines in Phillips Arm district, Alberni on Vancouver Island and among the Gulf Islands are being developed and the order sent at great expense to American smelters.

The Golden Cache, advertised in America and England as a high grade $50 proposition and sold in large lots as high as $1.80 a share, is being offered all the way from 15 to 40 cents. Some 745 tons put through the mill went $3.10 per ton in gold. A large number of shareholders, however, will not sell their stock at present at any price and others are buying it in at the low prices from motives and suspicions usually prevailing in a case of this kind.

The Orphan Boy mine is again heard from. It will be remembered that the manager of the Orphan Boy Company was accused of fraud in selling the mine on a judgment which it is alleged was acquired for a purpose, and so defrauding the shareholders, who got next to nothing. The case was thrown out in the courts and the parties who bought the claim—experienced company promoters—have added other claims to the Orphan Boy group and are forming a syndicate to operate them. Although the former Orphan Boy Company went to the wall through bad management, it has always been conceded that the claims are excellent free-milling propositions. The Channe Company, who sold their numerous claims on Phillips Arm to the Gold Fields of British Columbia for 30,000 shares of one pound Gold Field of B. C. stock, guaranteed par, and $10,000, and purchased more claims in Kootenay, are reducing their stock from $1,000,000 to $250,000, pooling the present issue and issuing treasury stock at 25 cents par. They are selling their Gold Fields stock in England and as the proceeds come in they propose to pay dividends to the shareholders from it and take the proceeds of the treasury sale for development. GOODMAN.

Vancouver, B. C., Jan. 10th, '98.

(Special Correspondence).—The stamp mill on the Morning Glory makes its first clean-up on the 10th. The first payment on the Monashie mine has been made. The deal on the Bon Diablo has fallen through, but may be resumed in the spring. Work on the Density has been discontinued for the present, awaiting instructions from London. The tunnel on the Blue Jay is 160 feet long, but they have not yet struck the lode. Camp Hewitt is looking well and great hopes are held of good results being obtained in the spring.

The sale of the Great Western at Rossland to the British American Corporation was completed last week. The deal was made on the basis of $101,000 for the property. Of this $50,000 was cash and $45,000 payable April 4.

The mining deals and options at Rossland within the past 60 days amount to not less than $6,000,000, and involve some of the greatest properties of the Trail Creek district.

The Mckintosh syndicate last week purchased the Surprise claim for $30,000 cash. They also obtained a bond on the Red Mountain for $100,000 and made the first payment of $50,000 on the Great Western.

Work will be resumed on the White Bear at Rossland, and on the Oregon group in Waterloo camp. A body of low grade ore has been encountered in the Jumbo at Rossland. The British Canadian G. F. Co. will erect a concentrator near Lemon Creek townsite in the spring. The average wages in Rossland are $3 per day; in the Slocan the miners are paid $3.50.

A strike of a 2-foot vein of rich ore is reported on the Golden Wedge, in Slocan district. A contract has been let for a big mill for the Joe Dandy, in Boundary district. Mayor Wood of Greenwood City has acquired W. W. Gibbs' interest in the Snowshoe claim for $45,000. In sinking the shaft from the 600 to the 700-foot level in the Le Roi, the workmen unexpectedly came into a 4-foot ore body which assays from $40 to $60 per ton.

ALASKA.

E. O. Lamphere and M. P. Gilbert, of Chicago, Pres. and Sec. of the Free G. M. & M. Co., have been examining the property they purchased recently at Berner's Bay, with a view to laying out proposed developments. The condition of the bond on this property is that within a year extensive developments shall be prosecuted and a 40-stamp mill built.

The Free G. M. & M. Co., of Chicago, is operating the Snelp property at Snettisham. Seven men have been working for two months opening up the ledge. The intention is to build a mill.

THE KLONDIKE.

More than the ordinary assortment of fairy stories come from the Klondike this week. The "mother lode" has been found, "mountains of quartz" and granite, "assaying well up in the thousands," as usual. The Rothschilds are going to build a railroad over the Dalton trail, 400 miles long, to cost $8,000,000. Several millions in nuggets are stacked up in the Alaska Co.'s Dawson City store for shipment. Returning miners confirm the statement that while provisions are scarce and dear at Dawson, there are no cases of starvation.

A. McDonald, Government engineer in charge of the geological survey of Alaska, reports to the Government that the gold fields on the American side of Alaska are probably more extensive and richer than the Klondike gold fields on the British side and that Americans can reach the Klondike by way of the Copper river in twenty-five days.

UTAH.

J. P. Turner, Supt. Last Chance, Bingham, expects to make his initial run within twenty days. Since the wiping out of the old plant by fire, the work underground has gone on. He has 1000 tons in the yards and 3000 tons blocked out below. The ore averages 14 ounces silver, 7⅛ per cent lead, and gold $1.20 per ton.

The Connor, Wonder and East Golden Gate, idle a long time, are being developed under the management of Mr. McFarlane.

Assays on the Jordan and Galena show 45 per cent lead, 60 ounces silver and a half ounce in gold per ton.

On the Mammoth, at Tintic, the 60-stamp mill is running constantly, and considerable high-grade ore is shipped.

During 1897 the Sacramento mine marketed gold cyanides valued at $88,678 16, paid dividends and expenses amounting to $69,795.20, and has in the treasury $18,887.96.

Smuin Bros. have uncovered a 40-foot vein in the Lake mountains on fifteen claims that averages $2 per ton in gold.

The Blue Bell, at West Tintic, has uncovered ore which assays 45 per cent lead and from $1.60 to $4.20 in gold. They have drifted on it a distance of 10 feet, the body continuing to increase as the work advances.

T. G. Merrill, of Salt Lake City, has bonded a portion of the West Dip, at Mercur, to Butte, Montana, people for $50,000, and requiring the sinking of 1000 feet of shafts.

IDAHO.

In high water, the antimony mine, at Kingston, has always been flooded, through broken ground near the surface. To overcome the difficulty, the shaft has been cemented, and it works to perfection.

C. H. Sheu and associates, who secured a bond on the Cannon group, have also acquired the Golden Gate Extension group of five claims. The property is equipped with a steam hoist and a double compartment shaft to a depth of 110 feet. According to the agreement, this shaft is to be sunk 600 feet further, unless ore is sooner encountered, and a force of ten men is to be constantly employed. The bond runs for ten months and calls for $160,000.

The Geyser-Marion shipped 500 pounds of gold cyanides last week.

The Potosi mine, at De Lamar, has been leased for one year by T. W. Drew, who is retimbering and cleaning out the tunnel. The mine has been a valuable producer.

The owners of the Coffee gulch property are continuing development work; they will soon cut the ore chute in the lower tunnel. The vein is one of the largest on Florida mountain.

MONTANA.

The Hope Co. contemplates improvements and extensive exploring work.

The Bimetallic concentrator at Granite is in continuous operation.

Dr. Mitchell's claims at Garnet have been leased to Ramsdell, Gilna & Co., who contemplate the erection of a cyanide process.

The Royal Gold at Philipsburg has struck another chute of good ore and started the mill January 1.

Johnson & Co. are making money out of the Last Shot mine at Basin. They have 25 feet of concentrating ore and took out $2400 in eight days.

On the Grey Eagle, near Basin, Holmes & Dolman are extracting five cars of ore a week.

The Heart Solo at Madison was bonded recently to A. Fisher, who is said to be representing Col. Chisholm of Bozeman, for $8000.

P. A. Largey bonded seven claims near Madison for $6000. W. Porter has charge.

Sloss, Moore & Co., operating the German Bar placer mine, have acquired an additional 1000 acres. A dredging plant will be put in operation.

T. G. Merrill of the Merrill-Miller M. Co., on which work was stopped over a year ago, owing to a strike, is arranging to start up the mine. The property has produced $400,000 within the last four years.

Butte *Miner*: The Montana Ore Purchasing Company is steadily hoisting 650 tons of copper ore every twenty-four hours from the Rarus and the Glengarry mines, most of the ore coming from the Rarus, notwithstanding the fact that the courts do not permit Mr. Heinze and his associates to take ore from the portion of the Rarus now in litigation between the Montana Ore Purchasing Company and the Boston and Montana Company, in consequence of an injunction issued at the time the original suit for over half a million dollars damages was filed by the Boston people for ore alleged to have been extracted from the lower levels of the Pennsylvania mine through the workings of the Rarus.

The Anaconda Mining Company is reported to be shipping to its smelter over the Butte, Anaconda and Pacific Railway 215 cars of ore a day. Each car is approximately loaded with 58,000 pounds of ore, in round numbers 6000 tons taken from the mines each twenty-four hours.

WYOMING.

The Wyoming R. & C. Co. at Hartville is preparing to commence operations on the Sunrise, a copper-iron claim. It has 20,000 tons of iron ore, containing from 2 to 5 per cent copper, on the dump, the result of former operations. It is thought this can be utilized at a profit as a fluxing ore in the Denver smelters.

The coal production of Wyoming for '97 was 2,663,133 tons.

SOUTH DAKOTA.

The Big Four M. & M. Co., at Central City, is crosscutting the formation at 500 feet depth. Four shoots have already been cut. J. W. Dalby is the manager.

MICHIGAN.

The mineral output of the Franklin mine for December was 152¼ tons, compared with 153 tons for November and 156¾ tons for December, 1896. This makes 1791¾ tons for the year 1897, against 1684¼ tons for 1896.

TENNESSEE.

English capitalists have concluded negotiations for the purchase of the coal mining properties in Eastern Tennessee and will pay for them about $5,000,000

COLORADO.

Development is being pushed on Golden Island No. 2 at Salida. The shaft is down 50 feet with a well defined vein.

On Golden Island No. 1 the vein matter is 4 feet.

The Crete, at Turrett, has attained 50 feet and has a foot of ore assaying $30.

Within the next six months the Aspen district will see in operation seven concentrating plants with the possibility of an eighth. Four will be for custom ores, while the others will handle the output of the Smuggler, Mollie Gibson, Argentum-Juniata, Farrell and Little Annie properties. The Smuggler has about completed its new plant and the Argentum-Juniata-Mollie Gibson joint mill is well under way.

Work is being pushed on the Standard tunnel under Beacon hill. The bore is in 1200 feet, and is near the Orizaba vein. It is backed by the Standard Oil people.

The Colorado Fuel & Iron Co. has 450 men employed in rebuilding its steel plant at Pueblo. A large portion of the old structure has been taken down and the new structural steel is being put in position.

The Ward Railroad Co. has bought a large tract of land surrounding Owen Lake, four miles from Boulder, and proposes establishing a town which will be known as Culbertson. Work has been commenced on the erection of a large reduction plant by the company, which will also build railroad shops in the spring. The reduction plant will cost $100,000 and will have a capacity of 250 tons per day.

Ore shipments from Ouray for 1897 amounted to 3076 carloads.

The Iron Camp, at Saguache, has a contract for shipping 1100 tons of ore daily.

In 1897 San Juan county produced 165,000 tons of ore of a total value of $1,955,453. Operators in this county have things down so fine that a profit is realized on $7 ores.

The Commodore Co., of Creede, have increased their output to 125 tons a day. All low grade ore is being left in the mine.

The Mt. Rosa M., M. & L. Co. gave a bond for $250,000 to J. A. Connell on the Gold Coin, at Victor. The lease runs eighteen months; the royalties are 25 per cent.

The output of the American, in Ouray, has been considerably over $1,000,000. It employs the year round from sixty to eighty men and has a large electric plant.

At Leadville, the Pyrenees shaft on the New Year's mine has reached 750 feet.

The Nettie Morgan, near Leadville, makes steady shipments.

The Seneca, of the Pittsburg, is shipping thirty-five tons per day.

The old Gallagher, on Iron hill, one of the first finds in Lake county, continues a producer, shipping 1500 tons of oxidized and sulphide ores.

Nearly 100 tons of iron and silver bearing ores are shipped daily from the Matchless and Duncan mines, Leadville.

The Catalpa and Crescent, at Leadville, the heaviest shippers in the district, output 250 to 300 tons per day of manganese iron.

The Congress, at Silverton, is shipping twenty tons daily of copper ore. The ore will average 20 per cent copper, 25 ounces gold and 30 ounces silver.

On the Silver Ledge mine, near Chattanooga, under the management of M. Anderson, extensive development has been carried on, and high-grade ore encountered.

After expending $200,000 to locate pay mineral at a depth of 1200 feet, the Free Silver, at Aspen, has suspended operations.

The Resurrection, at Leadville, averages for the last ten days eighty tons a day.

Fifty tons per day is shipped from the Sedalia.

The ore purchases at Georgetown for 1897 amounted to 928,012 ounces of silver, 1797 ounces of gold, 38,310 lbs. of copper, 995,531 lbs. lead, of which the total cost was $521,-263

E. W. Thompson has purchased the Poor Woman mine at Sunset for $10,000.

The Jason lease, Leadville, is averaging 40 tons per day of iron.

The Mab shaft has reached the 1000-foot mark.

The Elk mine on Carbonate hill is shipping a fair grade of iron.

The Portage M. Co. at Telluride owns eight claims. The general average of the ore is from $50 to $75 in gold and silver. The company contemplate building a concentrating plant.

The Invincible G. M. & M. Co., near Rico, is preparing to work on an extensive scale the coming season.

The Pactolus G. M. & M. Co. has made the first of a series of regular shipments of high-grade gold ore.

NEW MEXICO.

The Golden Treasure, in Taos county, shows five leads varying from one to ten ounces per ton. At the Stella, the values average from three to four ounces per ton. The Maud M. has a vein of $25 ore, carrying gold, silver, copper and lead. The Great Western, on Black mountain, averages $25 per ton. Work will be pushed all winter. The Ajax, in Red river, has cut a vein of gold and copper, which runs about $20 per ton. The total ore output of the Hillsboro mines during 1897 was 9304 tons. Linder & Crumrine, Snake mine lessees, are occupying the Porter mill with 150 tons of $35 ore. John Buttecke is sinking on a 5-foot chimney of gold ore in the Freiberg, at Hillsboro. J. L. Doran has taken a lease on the Graphic, in the Hadley district, for one year. Ore has been developed on the fourth and fifth levels.

Work has begun on a smelter at Santa Rita. The company is shipping two cars of iron per day.

Another strike of copper bearing iron ores has been made on the Mimbres mine. A shipment made last week gave returns of 18 per cent silica, 54 per cent iron, 6.8 copper, 8 ounces of silver and $1.20 gold per ton. This ore was taken out in sinking the new shaft which has attained a depth of 45 feet.

J. B. Gilchrist continues to extract rich copper ore from the Guadaloupe and Chino mines. The Oxide is producing ten tons per day of 20 per cent copper ore.

Crawford & Derbyshire, st Silver City, sold 461¼ tons of concentrates, produced from the tailings at the Pacific mill.

G. W. Stoneroad will deliver 50,000 feet of timber to the Old Abe mine, at White Oaks.

The Percha & Rex mine, in Hillsboro district, shipped thirty tons of lead ore.

J. C. Bender bonded the Gilbert & Brown property, at San Pedro.

The Old Abe shaft, at White Oaks, is 755 feet.

At the Madrid coal mines, Cerrillos, there are 400 employes, and the monthly payroll averages $15,000.

In Red River district there are twenty-five properties that have from 85 to 300 feet of work done. The ores are sulphide, hematite and manganese, and can be treated by concentration.

C. F. Potter entered for a Colorado company at the U. S. land office in Santa Fe 147½ acres of placer ground in Taos Co.

ARIZONA.

The Springfield M. Co., near Peeples valley, are finishing their 10-stamp mill. There are 200 tons of high-grade ore on dump. Their Monte Cristo shows a ledge 2½ feet of $40 gold ore, of which $10 is free gold and $30 in the concentrates.

The U. P. mine at Peeples valley shows 4 feet of $31 ore.

Wilson, Wood & Scanland have bonded six copper claims in the Chiricahua mountains, near Tombstone, to an English company for $50,000.

A block of onyx weighing 9500 pounds was shipped East from the Big Bug quarries near Phœnix.

Gov. McCord has invited those interested in mines and mining in the Territory to meet at Phœnix on January 25th for the purpose of forming a mining association. The Governor, in his address, says "this call is without authority of law, but, as nearly all Western States have such an organization which has resulted in much benefit to the interest, I have taken the liberty to take the initiative by issuing this call."

At a depth of 375 feet water has been encountered in the Commonwealth mine at Pearce. The flow is so great that a pumping plant will be put in.

The Fitts Copper Co. in Cochise Co. have decided to order a smelter of thirty tons capacity. The Gold Cliff Co. will put up a 10-stamp mill within sixty days. The Golden Rule Co. contemplates the erection of a mill also.

MEXICO.

Two Republics reports that the output of mines in Monterey is increasing. The Mina del Agua are producing forty tons per day. This ore is treated at their concentrator in Cerralvo. The zinc is shipped to Europe. The mines worked in the Cerralvo district are the Refugio, Purisima and Barradon. They belong to F. Armendaiz, and are producing thirty tons per day. The San Pedro mines are sinking shafts.

The Bornio M. Co. at Las Planchas shipped four bars of silver bullion, 975 fine, weighing 6000 ounces.

Mechanical Progress.

American Locomotive Builders.

The following letter, signed Angus Sinclair, editor *Locomotive Engineer*, New York, recently appeared in the London *Times* and has attracted attention:

Within the last week American locomotive builders have received orders for fifty-eight locomotives from foreign countries, making a total of about 200 orders for locomotives placed here within six months for foreign account. A considerable part of the engines are for European railways. Most of the contracts were bid for by British locomotive builders, and Americans received the orders because their prices were the lowest submitted. This seems to indicate that British locomotive builders are rapidly losing their hold of foreign markets. It might be edifying to your readers to learn how Great Britain is losing a line of business of which she held a practical monopoly only a few years ago.

To obtain a clear idea of the causes which have pushed the United States to the front in the manufacture of locomotives and other machinery, it is necessary to look back a little more than a century when Eli Whitney, inventor of the cotton gin, introduced into armory work a system of interchangeable production of parts. Before his time every part of a gun was made to fit that particular gun and would not fit any other. Whitney devised a plan of making every stock, lock and barrel exactly alike. The parts were finished in formers, jigs and templates, and then all that was to be done to produce a finished gun was to assemble the parts together.

The system was new and strange, and therefore worthy of being regarded with suspicion, and Whitney was looked upon by many as a fanatic, and his system made little progress for a few years; but self-interest is more powerful than conservative notions. Skilled labor was always dear in this country, and after a time the men in New England who were striving to keep alive the infant mechanical industries turned to the Whitney system as a means of lowering the cost of production to meet outside competition. The clockmakers of Connecticut were the first to adopt it extensively, and they worked it so successfully that a few years afterwards they were sending their clocks into every foreign market of the world and underselling the cheap labor of Europe. Sewing machine makers, airbrake makers, and other makers of small articles of common size followed the example of the clockmakers and profited accordingly.

The interchangeable system of production is better adapted to small article than to large pieces, and it made slow progress into the shops where heavy machines were constructed. Twenty years ago makers of small engines were turning out engines that had parts as exactly interchangeable as parts of a sewing machine, and gradually the system was making its influence felt in locomotive work. Great difficulty was felt in adapting the Whitney principle to locomotive building, principally because there is so much diversity in the parts of the locomotives ordered by railroad companies, but some of the brightest railroad engineers of the country were for years wrestling with the problem, and a system of production was worked out which reduced the cost to surprisingly low figures.

From the incipiency of the interchangeable system of production it was found most satisfactory to do the work by the piece in preference to day labor. American workmen are so much accustomed to piecework that very little sentiment exists against it. This work has encouraged mechanics to devise and improve tools and perfect methods for doing the work, and the extraordinary low cost of labor on some machines has resulted from the use of ingenious tools produced by workmen and patented by the inventors. Another influence it has is to make men in charge of a shop keen to see the merits of any new tool. When a machine tool has been put upon the market which promises to reduce the cost of production the men in charge of every first-class machine shop proceed to see whether it would pay to throw out a good tool to make place for the latest article. They generally decide to purchase the new tool. An expression is often heard among our locomotive builders, "We cannot afford to use worn-out tools." From what I have seen of the shops of our competitors abroad I think the prevailing policy is, "We cannot afford to buy new tools."

These are the influences which are giving the United States locomotive builders the markets of the world. The grim principle of supply and demand calls for cheapness, and our locomotive builders are in a position to undersell all competitors, just as the Connecticut clockmakers did three-quarters of a century ago.

Nine years ago the writer make a tour among the principal locomotive building shops of Europe, in company with the manager of one of our largest locomotive works, and we naturally were comparing shop methods as followed there and with us. We were aware that, when a foreign order for locomotives was awarded to an American firm when British builders were bidders, the British engineering press howled that the use of inferior material enabled Americans to undersell their British rivals. We were anxious to find out the truth of the matter and took notes.

On returning home the writer was constrained to publish in his journal an article to this effect:

In spite of the low wages paid to skilled mechanics in Glasgow, the cost of building a locomotive there is considerably higher than it is in the United States. When Bret Harte was American consul in Glasgow one of his reports to our Government brought this fact out very decidedly, but the accuracy of his conclusions was questioned by those concerned in defending British interests. We recently secured information which corroborates the correctness of Consul Harte's conclusions. One of the leading Glasgow locomotive builders built 200 locomotives last year, while employing on an average 2500 workmen. A well-known American firm in the same time built 300 locomotives, while employing 1400 workmen. Allowing 300 days for a year's work, the American firm put the labor of one man for 1400 days on each engine finished. The Scotch builder, on the other hand, put the labor of one man for 3750 days on each locomotive turned out of his shop. The weight and power of the American locomotives greatly exceed those built at Glasgow.

That was a statement of facts which ought to have received attention from those interested in conserving British trade. Did they accept it in the spirit that begets progress? Not at all. The leading British engineering journals denounced the statement and said that it was a parcel of Yankee lies. Since that time American locomotive builders have been steadily reducing the man-days necessary to finish a locomotive, and British builders have remained almost stationary. The large foreign orders that have come to American locomotive builders is the beginning of the end that will see British locomotive builders out of the foreign market.

Among recent orders placed in the United States are eighteen locomotives for the Grand Trunk Railway of Canada. There is at Kingston, Ontario, locomotive works that could build all the locomotives used in Canada if they were properly equipped and operated, and they are protected by a tariff duty of from 30 to 35 per cent ad valorem on all locomotives imported; but the United States builders underbid them on almost every order, although wages are lower and living is cheaper in Canada than they are in our industrial centers. Why is this thus? It is because the Kingston locomotive works are controlled by a firm in Scotland, which "cannot afford to buy first-class tools" or undertake the expense of reorganizing the shops to work on American methods.

In a newspaper controversy about the rights and wrongs of the engineering strike going on in Great Britain I have repeatedly seen the statement made by workmen that if their trade is driven away from the British isles they will follow it. Should they follow it to America they will have to greatly change their ways to secure steady employment. Instead of an eight-hour day they will be glad to remain in the shops fifty-six or sixty hours a week. If they object to attending to as many machine tools as other mechanics operate, they will be sent to the office for their time check. If they happen to be employed on day work, which is necessary in a few departments, they will find that they cannot push a file or wield a scraper with deliberate leisure. They will find a foreman in evidence who has a habit of saying, "Do you intend working all week on that two hour's job?" When he gets thoroughly drilled into the habit of the ordinary American machine shop he will understand why the keenest observers say that, while paid the highest wages in the world, the labor of the American mechanic is cheaper than that of any other workman.

Electrical Progress.

Nicola Tesla's New Engine.

Tesla says that coal will not play so important a part in producing the power of the earth as wood does now, and shows an invention of his in the experimental stage, about which he declares that there is no possibility of its failure. He declares that the apparatus is so simple that the least learned in mechanics can comprehend it, and if it were fully described others might seize his idea, patent it, and control a blessing which he intends shall be a free gift to the world. This is so extraordinary, so totally at variance with established customs, that it is almost as unbelievable as the discovery itself.

In the center of a large room with a glass roof Tesla will place a huge cylinder of thick glass on a bed of asbestos, supported by a firm stone pedestal placed in the center of the room. The circle will be laid lengthwise, and will be surrounded by a circle of mirrors covered with asbestos coats to refract the rays of the sun into the glass cylinder. The cylinder will always be kept full of water, which will have been treated by a secret chemical process, which Tesla claims to have devised, and which, he says, is the only complicated part of the discovery. All day long, while the sun shines, its rays will be refracted into the glass cylinder. The chemical treatment makes the water easily susceptible to heat, and in a little while the vaporizing begins. The steam thus in the cylinder is carried to a steam engine of the ordinary description. The engine in turn will generate electricity, which will be stored and transmitted by cables to the factory and the home. The power house will store sufficient electricity to meet all demands during the time that the sun does shine, although it may be clouded over for weeks at a time. "Most people will contend that the plan to harness the rays of the sun and make them operate the machinery of man, and to give light and heat, is the idle fancy of a dreamer," said Tesla. "I would indeed be surprised if they were to contend otherwise. There has never yet been proposed a single great scientific enterprise that has not at first been met with ridicule and laughed at as something beyond the bounds of possibility. Every one will remember the days of horse cars, when electric street railways were first talked about as possibilities. The suggestions of cars running along the streets without horses in front of them was laughed at. But now people have trolley cars running in villages where, a few years ago, horse cars were considered too expensive, and they pay no more attention to the marvel they witness every day than they do to an express wagon rumbling along the same street. It will be the same with the motive power generated by harnessing the rays of the sun. The first two months that the generating stations are in operation they will be places of intense interest, but after that people will think no more about them, except as places of business. They will regard them as little as they do gas tanks, electric light plants or water reservoirs. They will simply suggest monthly or quarterly bills, such as they now pay for water or gas, except that the bills will be much smaller. I do not care at this time to go into details. I have not yet begun the practical part of the work. I wish to have the experimental part so completed that no one can stick a pin into it. But I will say that the results so far achieved are all that I could desire, and they place all possibility of a failure beyond the shadow of a doubt. I am certain that the new apparatus will come into speedy and general use. Its cost is so insignificant that it cannot be ignored. After the apparatus has been placed in any station there is absolutely no expense in running it for years, except the salaries of engineers and the small cost of the wear and tear of the apparatus, which will be eventually anything but expensive. The whole business will be so simply arranged that there will be no probability of its breaking down; but even if it should happen that one station would be useless for a short time, the immense amount of electricity always at hand—for it will cost practically no more to generate 5000 volts than to generate so many million volts—will bridge over the difficulty. There would be nothing to prevent the generation of a whole year's supply in case of an accident in the generating machinery. There is nothing unnatural in the proposition to have the sun drive the machinery of the earth and, indirectly, to heat and light the planet at night as well as by day. It is a great deal less artificial than for men to delve down into the bowels of the earth at so much trouble and loss of life in order to get a few handfuls of coal to run an engine a short time and then to make spasmodic return trips for more. As to the proposition to have each city look after the heating and lighting of the homes of its inhabitants, there is nothing more extraordinary about it than the present system of cities supplying water pipes and sewers and private companies supplying steam heat, gas light, electric light and motive power." All of which has been said before.

Deflection of the Magnetic Needle.

Experiments that have been made by Russian and French savants in connection with the remarkable deflection of the magnetic needle over an immense area in central Russia have given curious results.

The observations were confined to the strip of country between Moscow and Kharkov, a distance of about 850 miles. The needle showed the greatest aberrations in the province of Kursk, where in the north it was deflected 20°. One hundred and fifty miles southeastward the deflection exceeded 96°, the needle pointing east and west instead of north and south.

Engineers who are engaged building railroads in that part of the country are much interested in the experiments. They speculate as to how the magnetization will affect the durability of the rails.

It is known that rails are usually more durable when laid north and south than in other directions, the greatest wear from magnetism being when they are laid due east and west.

EXPERIMENTS have been made by chemists in the hope of discovering some process of giving greater tensile strength to electrolytic copper, but so far the results obtained have been of a negative character. An experiment of this kind was made at Dollar bay,

Michigan, a year ago, when several carloads of Montana copper were received at the plant of the Tamarack-Osceola Manufacturing Co. Every effort was made to secure good results from the western copper in its course through the wire drawer mandrils, but unsuccessfully, there being the usual difficulties met with because of the lack of cohesiveness—a marked characteristic of Lake copper—but which is lacking in the metal when secured by its precipitation through the use of the electric current. Further tests have since been made, but the results so far secured are not encouraging.

MERCUR, Utah, will soon have electrical power and light. The Telluride Power Company have their work completed. The Salt Lake Electrical Power and Light Company is pushing its project, which derives its energy from the Jordan river, and work will soon begin on the pole line of eighteen miles from the Narrows to Mercur. A 5600 H. P. plant is being put in, and the 15th of March is the time set for its completion, when it will also furnish power and light to Bingham, twelve miles away. The wire, poles and machinery are now on the way, and work at the Narrows goes on in preparation for the machinery. Four 72-inch pipes, each 340 feet long, will convey the water into the turbines, and 1000 cubic feet per second will go through them. Seventy-five feet fall will be developed, which in reality is but 55 feet, as a draft tube will raise the water from the river 20 feet, acting as a syphon. The power will go over a No. 4 wire, and it is said only about 5 per cent of it is lost in transmission.

THOS. A. EDISON JR. is credited with announcing that he can photograph thought. Nicola Tesla tells a New York paper that he has "harnessed the rays of the sun" and will compel them to operate machinery and give light and heat. This invention is still in the experimental stage, but he declares that there is not a possibility of its failure. He has discovered a method of producing steam from the rays of the sun. The steam runs a steam engine which generates electricity. It is probable the dailies have distorted the utterances of these electricians, who usually let results attest the worth of their efforts.

THE Artesian Water Works Co. of Alameda, Cal., is considering the bringing of a suit against the Alameda, Oakland & Piedmont Electric Railway Co. to compel it to take steps to prevent damage being done to the former's water pipes by electricity escaping from the rails. No similar case has been carried into the California courts before. Supt. Borden of the Water Works says that the escaping electricity so injured the pipes that they have to be replaced at short intervals.

Colorado's Gold Output.

TO THE EDITOR:—The output of gold for 1897 is an interesting study for the business world generally. It is encouraging to note the success of capital invested directly and indirectly in mining pursuits. The laudable ambition displayed by the States seeking to surpass each other in the product of the mines is worthy of comment.

Colorado has asserted that her output for 1897 exceeds that of California for the same year. But is it not a fact that in this output claimed by Colorado much, if not all, the gold produced by New Mexico, Arizona, Mexico, and even some from California, is computed? The natural channels for marketing the gold of the places named, including a part of California, would be Denver, and, consequently, Colorado credits it to her own account. Is this idea correct? A. T.

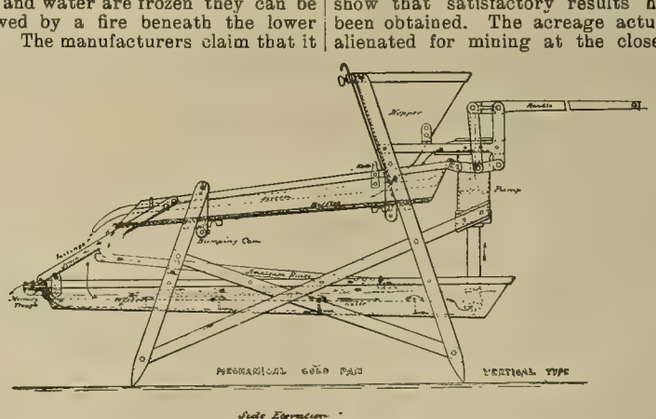
Grass Valley, Jan. 10th, '98.

THE accurate determination of the atomic weights is shown by Prof. F. W. Clarke to be a matter of real practical importance. The atomic weight of chromium is still placed by European analysts at the old determination of 52.5, while American chemists have adopted the corrected value of 52.1. A result is that chromic iron, which is imported by the Baltimore Chrome Ore Works in cargoes of about 2500 tons, is valued by Glasgow assays at $367.50 per cargo more than Baltimore assays.

Scientific Progress.

Pseudo-Science.

To what extent are men of science responsible for the credulity which everywhere prevails in reference to all matters relating to scientific discovery or accomplishment? This question, says *Science*, is not to be lightly set aside, for the existing condition may well create alarm among all who seriously consider the welfare of science, of scientific men and of the people generally. Several causes have conspired to bring about this condition, two or three of which may be mentioned. To begin with, during the century which is now approaching its end scientific discoveries and their applications have been so numerous and so far reaching as to practically revolutionize conditions of material existence, and they have often been so wonderful in character that it ought not to excite surprise to find intelligent people ready to accept without question announcements of inventions and discoveries of the most improbable and absurd character. Along this line the evil influence of a sensational press is enormous. It was bad enough ten years ago, but it has been greatly magnified by the recent and, on the whole, unfortunate cheapening of processes of illustration to the seductions of which nearly every newspaper in the land has yielded. To this has been added the newspaper "syndicate," by which men who know really nothing of science are employed to furnish sensational articles on scientific discovery, illustrated by sensational pictures, all of which is the more injurious because often founded upon a slender, microscopic tissue of fact. Unfortunately, some men who may be said to inhabit the fringe of genuine scientific activity lend themselves to this sort of thing and are made much of accordingly. Whole pages of this modern journalism are filled with accounts of discoveries that *are going to be made*, for writers of this class are shrewd in taking advantage of the fact that human interest and human memory are now practically restricted to about twenty-four hours in time. The publication of a broadside describing an alleged improvement of the telescope or microscope, in which there is absolutely nothing new that is true or true that is new, adorned with a series of cuts largely imaginary and many of which have no relation to the subject matter, has served the purpose intended when its author has received his pay from the "syndicate," and when the syndicate has scored a triumph in what in these days is called "enterprise." Even the most conservative among men of science are made to appear as willing purveyors of sensationalism by what ought to be looked upon as an unwarranted and illegitimate use of the results of carefully conducted investigations, often before such results have received final consideration and approval at their own hands.



If *all* impressions made by this false popularization of science were to disappear in twenty-four hours the evil would be greatly lessened, but unfortunately there are many very intelligent and thoughtful people, who ought to constitute the best support of scientific work, upon whom they are more lasting. To such the line separating the genuine accomplishments of honest scholarship from the output of sensationalism, which ought to be clear and sharp, is becoming very nebulous, and there is imminent danger of a revolt against the whole thing. The extent to which credulity has been carried was beautifully illustrated not long ago when a widely known scientific man amused himself and many friends by caricaturing, in the columns of one of our standard scientific journals, some of the phases of modern psycho-physics. So perfectly did the burlesque reflect the form and substance of some recent contributions to that science that it was immediately accepted as serious by the large majority of readers.

THE crude materials for the manufacture of carborundum at Niagara Falls are sand, coke, sawdust and salt. These are ready for use except the coke, which has to be ground to a fine powder. The furnaces are built of brick and have the form of an oblong box about 16 feet in length and 5 feet in width and depth. In the center of either end are the terminals, consisting of sixty carbon rods 30 inches long and 3 inches in diameter. The mixture is thrown into the furnace, connection made with the dynamo, and after twenty-four hours the process is complete. The carborundum occurs in the center of the mixture as bright, radiating crystals. In order to prepare the carborundum for the market, it is first placed under heavy iron rolls for the purpose of crushing apart and separating the individual crystals, which are then washed in a solution of acid and water to remove solubles, and finally dried and sifted to separate the different-sized crystals. During the year 1896 the carborundum company produced in round numbers 1,191,000 pounds of crystalline carborundum. Carborundum is used chiefly as an abrasive, for which it is especially well suited, owing to its excessive hardness, which closely approaches that of the diamond.

ACETYLENE may be employed for the determination of copper. The salt to be analyzed is dissolved in water mixed with a little ammonia and heated for a short time on the water bath. Acetylene is then introduced into the dark blue fluid to saturation. The precipitate is complete even in the cold. The copper acetylide is now collected, washed and decomposed by being digested with hot dilute nitric acid, filtered from the carbonaceous residue and the filtrate evaporated to dryness and ignited. The ash is weighed as CuO. For the separation of zinc and copper, as salts of the former metal are not decomposed by acetylene, the method is most useful.

Mechanical Gold Pan.

Herewith is a side elevation view of a placer gold washing and separating apparatus made of steel, which gives a continuous motion to the screen, washer and riffles. But little water is required, and that which is may be reused, as the water is continuously returned from the lower to the upper washing and gold-saving pan. This mechanical gold pan is furnished, as desired, with either rotary or vertical operating mechanism. When the placer dirt and water are frozen they can be thawed by a fire beneath the lower pan. The manufacturers claim that it

Side Elevation.

MECHANICAL GOLD PAN.

can be worked with great rapidity, saving all the gold and concentrates, that it is suited to every climate and all placer deposits, weighing about 100 pounds and easily operated, packed in its own pan with provisions, clothing, etc., skidded and hauled about by one person, rigged up and started in five minutes.

The Parke & Lacy Co., 21 and 23 Fremont street, San Francisco, Cal., are sole agents for this coast. They will have one of these machines in operation at the Golden Jubilee Mining Fair at the Mechanics' Pavilion in San Francisco from January 29 to March 6.

Tin Mining in Perak.

According to the report of the Commissioner of Lands and Mines of Perak, which is a State on the Malay peninsula under British control, the output of tin in 1896 was diminished by two causes—the lower price of the metal and unusually heavy rains. The average price of tin for the past three years has been, commencing with 1894, $37.48, $34.28 and $31.76 per pickul, respectively. This last is the lowest average for six years.

The total weight of metallic tin on which duty was received by the Government, ore being reckoned as containing 65 per cent of metal, amounted to 383,226 pickuls (22,754 tons), being less by 17,720 pikuls, or 1052 tons, than the corresponding figures for 1895. The decrease is chiefly in the weight of the ore, which may partly be accounted for by the Straits Trading Company having called in some of their advances in the Kinta district, the principal scene of their operations. This company is the only European smelting firm in that part of the world. To entirely prohibit charcoal burning, as has been advocated, and to shut down the Chinese smelting *kongsis*, would create a monopoly for this one smelting company, and as that company declines to deal with the lower and more refractory grades of ore, there would be no market for such ores.

The value of tin exported in 1896 was $12,339,877, being $1,713,630 less than the value of the 1895 export. The duty collected was $1,541,052, being $128.038 less than the amount collected in 1896. Owing to the low price prevailing, the government reduced the rate of export duty during the second half of the year. Taking the year through, the duty was equivalent to 12.94 per cent.

Underground mining by means of small shafts, in lines at intervals of about 20 feet on the tin drift, was introduced by Chinese from Australia some four years ago, and has lately obtained considerable development in the southern division of the State. Ages ago this system appears to have been adopted by supposed Siamese miners in Perak. As to tin lode mining, there is nothing encouraging to report at present. The lode at Selibin, upon which a large sum of money had been carefully expended, was abandoned after a year's hard work, and no other tin lodes are being exploited. The Bakit Mass Company started with insufficient capital. It has been reconstructed, and it is hoped that the next annual report will show that satisfactory results have been obtained. The acreage actually alienated for mining at the close of 1896 was 67,553 acres. These figures show that a comparatively small portion of Perak is devoted to mining operations. The report notes that a fall of 15 per cent in the price of tin in two years has been accompanied by a fall in production of 3 per cent only.

Coast Industrial Notes.

—Over 100,000 tons of ice will be stored at Truckee this winter. In some cases it is put up at a cost of 5 cents per ton.

—Capt. D. L. Brainard has awarded to C. H. Frye of Seattle the contract for furnishing 75,000 pounds of bacon at $7.95 per 100 pounds for the Yukon relief expedition.

—The cruiser Chitose, built by the Union Iron Works of San Francisco for the Japanese navy, will be launched next Saturday. This will be a notable event, as it is the first large modern war vessel built in the United States for a foreign government.

—Sixty miles of steel rails for the E. P. & N. E. are in the Ft. Bliss, New Mexico, yards. Nearly thirty miles of the grade is completed, and by March 1st the road will be completed to the Jarilla mining district, thirty-five miles south of La Luz.

—The Southern Pacific and O. R. & Nav. Cos. have advanced passenger rates by rail and water between San Francisco and Portland. For a year the Southern Pacific Co.'s first-class rate between San Francisco and Portland was $10. The new rate is $17. The O. R. & Nav. Co.'s present first-class rate by steamer is $5. This is increased to $12.

—"The story is a pure fake," was what Charles H. Cramp said when shown a dispatch from New York stating that his company contemplated putting $10,000,000 into a ship-building plant at Seattle to undertake the building of war vessels for the Pacific. He added that the Cramp Company has no intention whatever of engaging in the ship-building industry at any place other than Philadelphia.

—Senator Lodge has introduced a bill to provide for the construction of a telegraphic cable from this country to the Hawaiian Islands and Japan, China and Australia. The bill grants a subsidy of $125,000 a year for twenty years on the service to Hawaii and an additional $75,000 a year for the same length of time for the extension of the line to Japan or Australia. A survey by the Secretary of the Navy to ascertain the most feasible route is authorized.

—The steamship Alameda from Australia this week brought nearly 200,000 golden sovereigns, equal to $1,000,000, consigned to the Anglo-Californian Bank of this city. This makes the total gold received during the present season from the same source $12,500,000—a much larger amount than has ever come from Australia as balance of trade in California's favor during the same period of time. Shippers of grain, lumber and canned goods predict a still larger business with Australia for '98.

—The Supreme Court of California has rendered a decision in which it emphasizes the principle of California law that no county, city, town, etc., shall incur indebtedness exceeding in any year the income and revenue provided for that year, and that indebtedness incurred contrary to this provision shall be void. The city of Vallejo made a contract with a San Francisco manufacturer for a certain amount of water pipe, which was delivered and paid for with the exception of $90.85, the special fund for that purpose and for the year being exhausted. The firm sued the treasurer, who demurred on the ground mentioned, which was sustained. The San Francisco man appealed, but the Supreme Court affirmed the judgment of the lower court.

—It is alleged that the builders of the railway from Kramer to Johannesburg, Cal., intend to build to the borax mines, sixty miles distant, and thence fifty miles farther to make a connection with the Carson & Colorado Railway at Keeler. In this regard it is noted that the owners of the Johannesburg road are intimate in the interests of the Vanderbilt lines, which now include the Union Pacific and may purchase the Central Pacific when it comes to be sold under foreclosure. If this be done, it would give the new owners a direct line via Reno, Nev., to southern California and Los Angeles, independent of the Southern Pacific. The contract for the 110 miles of extension has been virtually let to Ramish & Marsh, the contractors who built the present line from Kramer.

—The relations of the great powers are changing, and the Pacific is becoming the center of their striving. The powers that adjoin this ocean are destined to be the actors in the next drama of the world and the Pacific the stage thereof. England is the greatest of these powers. This she owes to Canada and to her possessions in the East. Russia is destined to a future greater than England's present. France is making desperate efforts to build up for herself an Asiatic foothold in this company. China's vast population and wide territory make her another factor in the problem. She may be conquered and enslaved for years, but the great vitality, the great individuality, the exclusive cohesiveness of her people, seem to destine her to an ultimately independent national existence. She must eventually emerge from her position of subjection and inferiority and become one of the great nations of the earth. Japan's role will be a smaller one, but the inherent identity of her interests with China's must make them allies against Europe in working out their common destiny. In the hands of these powers lies the future of the Pacific, and the future of the Pacific is the future of the world. Our country cannot shut its eyes to this condition. The people of America, with a rapidly increasing population producing more than they can consume, with an aggressive character which brooks no opposition, with a coast line greater than that of any power of Europe, dotted with flourishing cities, constitute a factor in the future of the Orient that no apathy, no neglect, can belittle. Whatever policy we may have inherited as to entanglements with European powers must be discarded here. The people of the United States must not be content to see their neighbors to the west, with their boundless potentialities of trade, handed over, an uncontested prize, to the ambitions of Europe. America may attempt to evade the responsibility thrust upon her. She may, with shortsighted resolution, turn her face away from her great future, but she will not succeed. The markets of the Orient are the heritage of her merchants, and the time will inevitably come when the voice of the Republic will be heard in Oriental courts with the same accent of authority as in the commonwealths of South America. It will be well if the certainty of this destiny could be recognized before European statesmanship has barred the way with "vested interests."

Personal.

W. B. DEVEREAUX of Colorado is in Salt Lake City.

JOHN CUPPS is the new Supt. Wheeler mine at Plymouth, Cal.

P. KERWIN of Virginia City, Nev., is in Grass Valley, Cal.

T. A. W. SHOCK is the new Supt. Portland, Or., Gen. Electric Co.

JAS. D. HAGUE has returned to San Francisco from New York City.

A. M. DOBBIE of North Bloomfield, Cal., has returned from Hillsboro, N. M.

MR. LOUIS JANIN has returned to San Francisco from Santa Barbara, Cal.

GEO. P. THURSTON is the new Secy of the Orleans M. Co., of Grass Valley, Cal.

GEO. W. TUTTLE, Supt. Rock Creek M. Co., Grass Valley, Cal., is in San Francisco.

W. H. HUTCHINSON is the new resident Mgr. Am. M. & D. Co., Gibbonsville, Idaho.

T. L. MITCHELL has succeeded L. L. Patrick as Supt. Montezuma mine, Kaslo, B. C.

HIRAM W. HIXON, author of a work on the metallurgy of lead and copper, is in Salt Lake.

P. C. DUBOIS, Supt. German mine, El Dorado, Cal., has returned to the mine from San Francisco.

JAS. M. PAGE of Twin Bridges is the newly elected president of the Montana Society of Mining Engineers.

JAS. CRONAN, recently Supt. of Hale & Norcross, Nevada, has charge of a large property near Hackberry, Arizona.

S. C. WILMANS, formerly of the Rose Creek M. Co., Sonora, Cal., has taken charge of the Boulder mine, Rescue, Cal.

T. H. JENKS, late with the Saginaw M. Co,, Tucson, is now assayer for the Table Mt. Copper Co., Mammoth, Arizona.

D. H. JACKSON of Placerville, Cal., was in Kern Co., Cal., last week examining properties for a New York company.

STEPHEN D. FIELD, whose many inventions in the electrical field are well known, was a recent visitor to San Francisco.

THOS. J. BARBOUR of the Risdon Iron Works, San Francisco, returned this week from a business sojourn in New York City.

COL. THOMAS EWING is in San Francisco, buying machinery for the Bedouin group of mines, Shirt-tail mountain, Arizona.

MR. JOS. MCGILLIVRAY, who has charge of extensive hydraulic mining work in Cariboo, B. C., is in San Francisco buying supplies.

F. W. WILMANS is Supt. of the Rose Creek, Harriman and Old Bonanza mines in Tuolumne Co., with headquarters at Sonora, Cal.

PROF. WALDEMAR LINDGREN, who has been engaged to deliver a course of lectures on practical mining at Stanford University, is at Palo Alto, Cal.

WM. FOSTER, known in California in connection with the Merced Gold M. Co., is now Gen. Mgr. American Mining & Development Co., Butte, Mont.

W. A. BURKHOLDER, who has resigned as Supt. Portland Gen. Electric Co., will, it is locally reported, settle in San Francisco, though remaining in the directory.

MRS. ELLEN PALMER, who is making a success of managing a mine at Hotchkiss mountain, Colo., is the only known woman mine superintendent outside of California.

ISAAC E. BLAKE, Mgr. Utah-Nevada Co. which has bought the copper mines in the Seven Devils region, sixty-five miles northeast of Baker City, Or., has taken charge.

W. C. RALSTON has returned from an extended sojourn on the Atlantic coast. While there he did considerable missionary work in the matter of a department of mines and mining.

U. S. SENATOR TURNER has returned from London and says that his mission was not to sell the Le Roi mine, but to create a market for that mine's stock; that to all inquiries he replied that the price of the mine was $5,000,000.

JOS. SMITH, who, probably as much as any one man, introduced and made profitable the use of cyanide at Mercur, Utah, has been sojourning in San Francisco for some weeks, and returned to Mercur last Monday.

HENRY A. JANVIER and Sydney E. Brown of Bridgeton, N. J., passed through San Francisco this week on their way to a central province of China, where they will build mints for silver and copper for the Chinese Government.

Books Received.

"*Copper*," is the terse title of a 200-page book published by D. Houston & Co., 22 Platt St., New York City, and sent postpaid for $2. It contains considerable new information and valuable statistics, including statements of the operations of several companies, regarding which ordinarily but little is known.

Recent California Mining Incorporations.

Bear Creek G. M. Co., San Francisco; capital stock, $100,000; actually subscribed, $25; J. B. Sherrard, L. Schlessinger, J. Posner, R. E. Ragland, C. J. Murphy.

Kern River Hydraulic Con. P. M. Co., Los Angeles; capital stock, $200,000; subscribed, $190,000; W. H. Barry, J. Hickler, A. Prenzlaner, S. W. Stone, W. G. Campbell.

Bedford G. M. Co., San Francisco; capital stock, $500,000; subscribed, $250; H. W. Morris, J. Buttgenbach, L. Weber, L. Brune, J. P. Wallace.

Princess M. Co., San Francisco; capital stock, $1,500,000; subscribed, $250; W. F. Fickersen, D. S. Sherman, W. A. Turner, E. L. McClure, J. J. Corey.

Golden Crown M. Co., San Jose; capital stock, $300,000; subscribed, $165,500; W. O. Hilbish, E. H. Wimple, A. McDonald, T. A. Perrin, F. P. Russel.

Bear Creek M. & P. Co., Mariposa, Cal.; capital stock, $500,000; subscribed, $625; J. D. Ludwig, W. S. Zeller, T. B. Bisland, J. F. Zimmerman, W. H. Moise.

Recently Declared Mining Dividends.

Mercur, Utah, $25,000; payable Jan. 20.

Silver King, Utah, Jan. 10, $37,500, making a total of $1,387,500.

Mammoth, Utah, $20,000; payable Jan. 20.

Le Roi, B. C., $50,000; Jan. 12. This makes $725,000 paid to date.

Quincy M. Co., Michigan, $3 per share, $300,000, a reduction of $1 from the previous dividend, which was $4 per share, paid Aug. 16, 1897; on Jan. 22, 1897, $8 was paid, $4 being regular and $4 extra. Total dividends declared since organization of the company, $9,770,000.

Morning Star, Iowa Hill, Cal., $6 per share; Jan. 10.

The Santa Maria de La Paz M. Co. at Matehuala announces six dividends for January of $10 each, payable on the 5th, 10th, 15th, 20th, 23d and 30th, under coupons 54 to 59, inclusive.—La Bolsa de Mexico.

Anchoria-Leland M. & M. Co., Colorado, 1 cent per share, $6000; Jan. 15.

Commercial Paragraphs.

THE Colorado Iron Works Co. of Denver, Colo., reports the shipment of four 43-cubic feet capacity self-righting slag trucks to the Detroit Copper Co. of Arizona.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JANUARY 4, 1897.

596,468.—BITUMEN CONVEYOR—A. F. L. Bell, Carpinteria, Cal.
596,648.—FRICTION CLUTCH—G. S. Binckley, S. F.
596,801.—STREAM MOTOR—J. T. Breneman, Walnut Creek, Cal.
596,804.—FEED TROUGH—J. G. Busch, Potter Valley, Cal.
596,805.—WINDOW FLY ESCAPE—A. J. Collar, Yreka, Cal.
596,490.—COUPLING—T. C. Edwards, Salmas, Cal.
596,746.—BOTTLE—W. H. Fulcher, Stockton, Cal.
596,935.—PEACH PITTER—G. E. Grier, Pomona, Cal.
596,678.—BALL BEARING—F. H. Heath, Pomona, Cal.
596,968.—AMALGAMATOR—J. A. Hedge, Los Angeles, Cal.
596,812.—ELECTRIC CONDUIT—W. D. M. Howard, Redwood City, Cal.
596,779.—STEP LADDER—T. M. Jones, Portland, Or.
596,890.—PRUNING TOOL—G. L. Sage, Los Angeles, Cal.
596,606.—FUNNEL—E. D. Middlekauf, S. F.
596,714.—PAPER TOOTHPICKS—M. Purdin, Medford, Or.
596,715.—BRUSH MACHINE—W. C. Read, Oakland, Cal.
596,716.—BRUSH MACHINE—W. C. Read, Oakland, Cal.
596,618.—CHAIN TIGHTENER—F. A. Redmon, S. F.
596,832.—PIPE FOR SMOKING—B. F. Smith, Represa, Cal.
596,645.—WOOD-BENDING MACHINE—Woodward & Brett, National City, Cal.

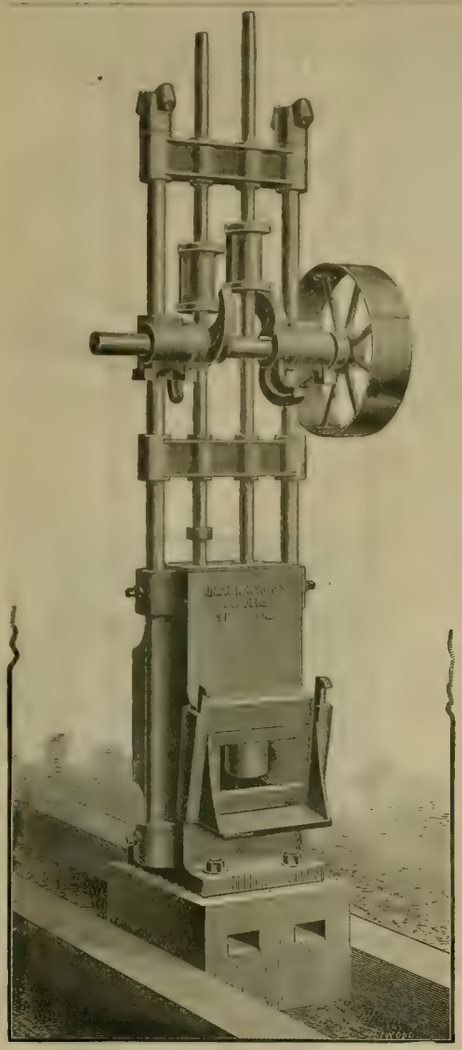
NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAVE AND STREAM MOTOR.—Joseph T. Breneman, M. D., Walnut Creek, Cal. No. 596,801. Dated Jan. 4, 1898. This invention relates to a device for producing power from the movement of the waves or a stream. It consists essentially of swinging suspended gates, the lower ends of which dip beneath the surface of a flowing current, a connection extending from one gate to the other whereby they are so connected in pairs that they will oscillate to and from each other, the floats being journaled vertically so that they may turn to alternately present their flat surfaces to one of the pair of shafts and the edges of the other. This allows the floats which present the flat surface to move in the one direction while the others move freely edgewise of the stream in the other direction. An intermediate mechanism is so arranged as to reverse the position of the floats when they have reached the end of the swing in one direction, and the steam acts to move the other set and return both pairs to the their original position. This oscillation continues and power may be transmitted from the floats to any pulleys or other machanism through which it may be employed.

COMBINED HARVESTER.—Benj. Hale, Stockton. No. 596,446. Dated Dec. 28, 1897. It relates to a novel apparatus for cutting, threshing, separating and cleaning grain in a continuous process by means of a machine which is adapted to travel over the field while carrying on the operation. What are known as "traveling harvesters" have usually been constructed by mounting a threshing machine upon four wheels and hinging to one side of it a large triangular horizontal frame having a reciprocating cutter bar at the front to reap the grain, a horizontal traveling belt or draper behind the cutter upon which the cut grain falls, which draper carries the grain to and delivers it into the feed house, from which it passes to the threshing cylinder and thence through the usual cleaning mechanism. The difficulty with this class of machines lies in the fact that, as the threshing machine portion is supported upon four wheels, it must, unless some provision is made for leveling it, necessarily tilt from side to side as the machine passes over irregular and uneven ground, and this throws the grain to one side or the other of the cleaning mechanism and makes the separation and cleaning very irregular and imperfect. In this new construction the threshing machine has a single large bearing and driving wheel journaled nearly centrally inside the frame and a steering wheel approximately in line with it at the front, so that the threshing machine is carried upon these two wheels in line with each other. When it is properly connected with the header frame, this connection will prevent it from tipping over. The connection between the two consists of a rack bar or equivalent bracing arm, one end of which is movable, so that the header frame inclines upwardly or downwardly in passing over uneven surfaces. The threshing machine can, by means of this connection, always be maintained nearly or quite vertical. Various mechanisms may be employed to make the connection between the two and to adjust it so as to keep the threshing machine level.



PIPES FOR SMOKING.—B. E. Smith, Represa, Cal. No. 596,832. Dated Jan. 4, 1898. This invention relates to improvements in smokers' pipes. It consists essentially in the combination with the bowl and the stem of a drip cup adjacant to the bowl into which liquid may be deposited, a chamber beyond the drip cup having a reduced neck and a larger neck at the opposite end to connect with the pipe stem. An absorbent material is placed within the chamber between the reduced neck and the inner end of the pipe stem and saturated with a vegetable oil which serves to connect the nicotine and disagreeable vapors which remain essentially substantially on the exterior of the absorbent material and will eventually pass back into the drip cup.

PROTECTING BARN AND FEED HOUSE.—John G. Busch, Potter Valley, Cal. No. 596,804. Dated Jan. 4, 1898. This invention relates to a barn or structure which is especially designed for the economical feeding of stock, and the protection particularly of young lambs, kids and other tender animals. It consists of a structure having closed roof and sides, a floor elevated above the surface of the ground to provide a space beneath into which the animals may be collected, while the space above serves to contain hay and other feed. Along the sides of the lower part are racks and troughs arranged to suit the class of animals which are to be fed, and means for depositing the feed therein either from the barn above or from the outside. Exterior to these feeding troughs and racks are hinged doors which in stormy weather may be closed entirely, but under certain conditions can be raised up so as to allow access to the feed devices from the outside as well as the inside, while the doors thus raised practically form shed roofs to protect the animals which are under them. The ends of the barn are also provided with hinged doors and mechanism by which they can be easily raised or allowed to close so as to keep out the cold at night or in very inclement weather.

WINDOW FLY ESCAPE.—Dr. A. J. Collar, Yreka, Cal. No. 596,805. Dated Jan. 4, 1898. This invention relates to an insect guard or means for reducing the number of house flies and other similar insects which congregate in the rooms. It consists essentially in the combination with the window sash of a means by which an aperture is created between the bottom bar of the sash and the window pane, forming a channel beneath the edge of the bar, and a curved plate coinciding with the channel, with intermediate means for supporting the edge of the glass. This construction is such that the flies following their usual habits will when they reach the lower edge of the glass pass out and up the curvature and thus outside of the glass. The tendency of the flies is to move upward rather than downward, consequently, when they have reached this aperture from the inside they may follow it out, but when they reach it from the outside, the tendency will be to pass on to the glass and up the outside of the glass rather than to go down beneath its edge.

TEN WEEKS FOR TEN CENTS!

Strange as it may seem, that big family paper, the *Illustrated Weekly Sentinel*, of Denver, Colorado, (founded 1890) will be sent ten weeks on trial for 10c.; clubs of six, 50c.; 12 for $1. Special offer solely to introduce the paper. Gold rings set with Rocky mountain gems are given free as premiums. Latest mining news and illustrations of grand scenery each week, also true stories of love and adventure. Address as above and mention PRESS. Write today; postage stamps taken.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

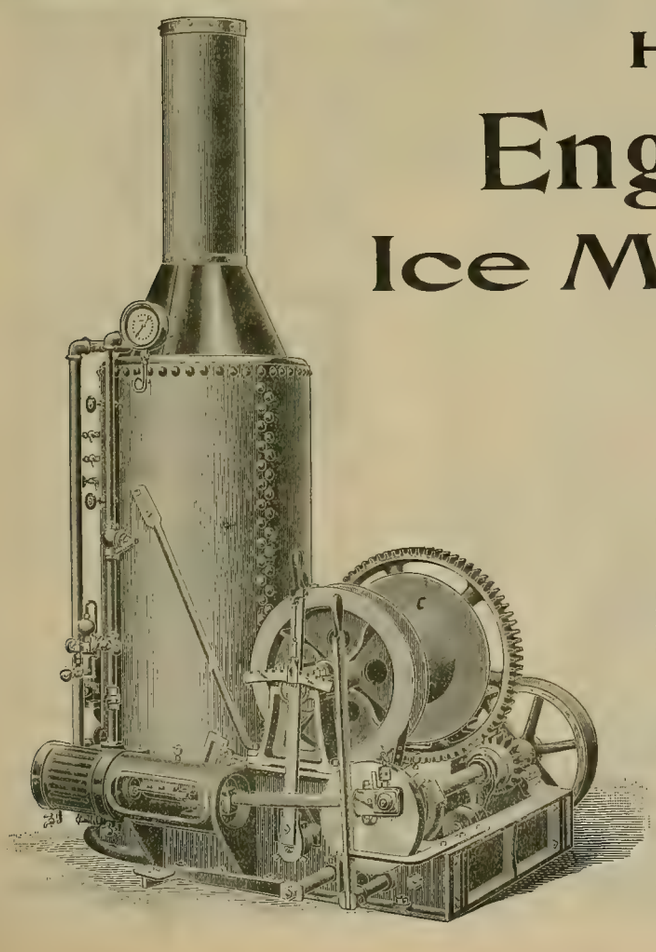
It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

BAKER & HAMILTON,



HIGH GRADE

Engines, Boilers,

Ice Machines,

Mining Tools,

ETC., ETC.

THIS CUT represents our Single Engine **PROSPECTORS' HOIST,** from 6 H. P. up, constructed with sectional iron frame, reversible link motion, improved brake, etc. Engine and Boiler can be disconnected and used for other purposes. Hoist and Engine can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also carry Double Engine Hoists, same type, with or without Boilers, from 12 H. P. up.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

WRITE FOR PRICES; THEY WILL INTEREST YOU.

Mining Engineer and Metallurgist,
Laboratory, 214 Pine St., San Francisco.

JAMES W. ABBOTT,
MINING ENGINEER,
GRANT'S PASS, - - OREGON.
The Mining and Treatment of Quartz and Gravels. Surveys, Maps, Reports.

W. J. ADAMS, E. M.,
PRACTICAL MINING ENGINEER.
Graduate of Columbia School of Mines. Expert Miner and Metallurgist of Gold Ores. Eighteen years' experience. Will report on Mines and Mills, and take full charge of Mining Properties. Address, 132 Market St., Room 15, San Francisco, Cal.

J. HOWARD WILSON,
Assayer and Chemist,
306 Santa Fe Avenue, Pueblo, Colo.
Correspondence solicited with SHIPPERS OF ORE TO COLORADO SMELTERS.

ALMARIN B. PAUL, M. E.,
ROOM 49, CROCKER BUILDING,
Cor. Market and Montgomery Sts., San Francisco.
Will act as AGENT for the sale of RELIABLE Mining Property. Principals desiring valuable quartz or gravel investments at reasonable prices will do well to see what I may have. Only legitimate mining properties handled.

C. E. DeFOREST,
Mining and Mechanical Engineer.
Will Examine and Report on Mines and Metallurgical Projects.
Terms, $15 Per Day and Expenses.
1618 CHAMPA STREET,
Denver.....Colorado.

ROBINSON BROS.,
CRIPPLE CREEK, COLO.
P. O. Box 194.
ASSAYERS AND MINERAL SURVEYORS.
Mines Examined and Reports Furnished.
Samples by Mail Solicited.

ABBOT A. HANKS,
Chemist and Assayer. Successor to Henry G. Hanks, established 1866. The supervision of sampling of ores shipped to San Francisco a specialty.
—718—
Montgomery Street,
San Francisco.

LOUIS FALKENAU,
STATE ASSAY OFFICE,
434 California St., near Montgomery.
Analysis of Ores, Metals, Soils, Waters, Industrial Products, Foods, Medicines, etc., etc.
Court Experting in all branches of Chemical Technology. Working Tests of Ores and Investigation of Metallurgical and Manufacturing Processes. Consultations on all questions of applied chemistry. Instructions given in assaying and all branches of chemistry.

J. J. CRAWFORD,
(Ex-State Mineralogist.)
MINING, METALLURGICAL & HYDRAULIC ENGINEER,
1209-10 Claus Spreckels Bldg., San Francisco.

HENRY RIVES ELLIS,
Mining Engineer and Metallurgist.
Assay Office and Metallurgical Wo ks
No. 318 PINE STREET,
San Francisco.....California.

Pacific Placer Machine.

Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our larger Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb., 400 lb., 550 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

WILFLEY CONCENTRATOR.

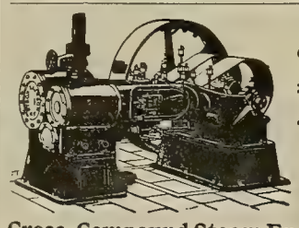
PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

SEND FOR CIRCULARS.

WILFLEY CONCENTRATOR.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:



1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. MINE BELL SIGNALS. Adopted, Used and in Force in Accordance with State Law.
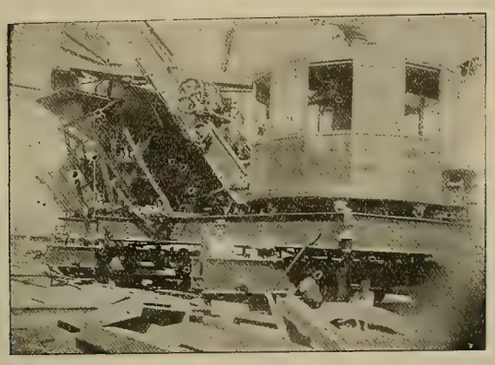
FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

ERASTUS S. BENNETT, President. SAMUEL DEXTER HAYWARD, Vice-President. D. F. COOPER, Secretary.

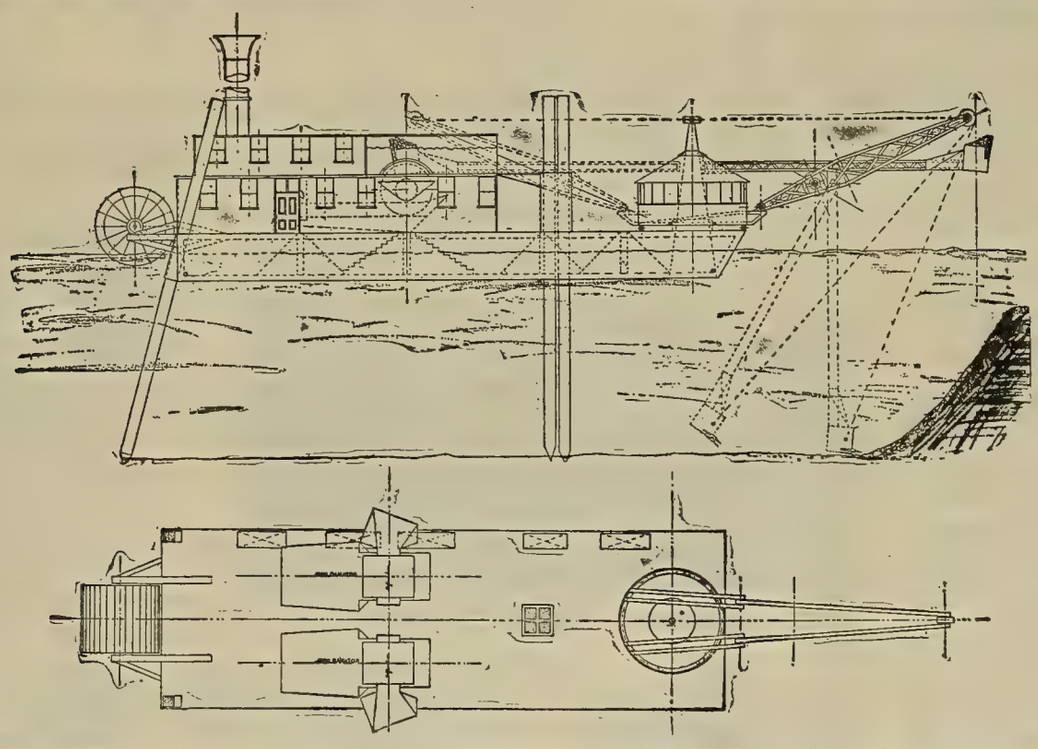
PLACER MINING

WITH THE



Improved Electrical Shovel or Dredge and Amalgamator,

—MANUFACTURED BY—



THE BENNETT AMALGAMATOR MANUFACTURING CO., Denver, Colo., U. S. A.

Works, Corner 36th and Wazee Streets, DENVER, COLO.

Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y. SAMUEL DEXTER HAYWARD, Manager. Cable Address, "Bennetts," Denver or New York. Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1...	2500	2 to 4	25 to 150	150 tons	Single operating plant
2...	5000	2 to 3	50 to 300	300 tons	Duplex operating plant
3...	7500	2 to 2¼	75 to 450	300 tons	Triplex operating plant

SWAMP AND RIVER-BED PLANTS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power) are made single or duplex; any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts and pieces may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or when dry ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for sample), renders them particularly valuable and indispensable in cases where, owing to fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

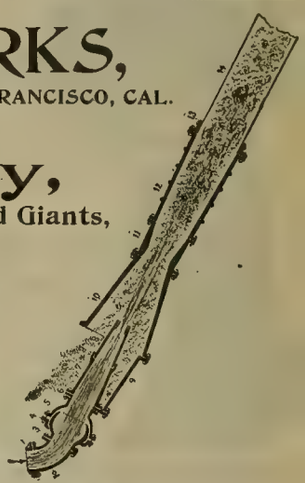
Hydraulic Mining Machinery,

Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.



HYDRAULIC GRAVEL ELEVATOR (in position.)

NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us.

The Double-Jointed Ball-Bearing Giants recently perfected and patented by our MR. JOHN H. HENDY are incontestibly superior to any other form of Giants yet introduced.

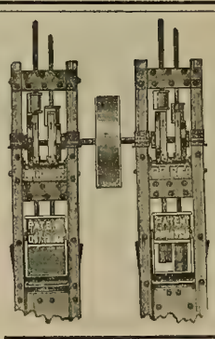
We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.

TRANSVERSE SECTION HYDRAULIC GRAVEL ELEVATOR.

THE GREAT MINING FAIR

WILL OPEN

Saturday Evening, January 29, 1898,



AND CONTINUE FOR FIVE WEEKS,

AT THE MECHANICS' PAVILION, SAN FRANCISCO.

The Fair will contain practical exhibits and demonstrations of quartz, placer and all other methods of mining, and mining machinery. Complete working plans of the North Bloomfield mill will be in operation on a large scale.

In connection with the Fair there will be a complete Klondike outfitting exhibition, together with Klondike cooking lectures and practical demonstrations of packing supplies over the trails by horses, burros and men; also the methods of transporting these supplies across the lakes and down the Yukon river to Dawson.

For information, apply to the Secretary, No. 31 Post Street, San Francisco, Cal.

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 13, 1898.

Trade has been quiet the past week, but everything points to a larger business in all branches of trade and manufacture than ever before enjoyed. Alaska and British Columbia will be large buyers, particularly the former. The different large American transportation lines recognize that San Francisco will be the center for obtaining goods and therefore they will run either direct from here, or else run from here touching at ports up north on the way to Alaska points.

General rains in this State the past week, with prospects favorable for more, have put merchants, manufacturers and all others in a cheerful mood, for they insure, with seasonable spring rains, large crops. The cold weather is quite a factor with fruits, for it puts the season back, which lessens the chance for damage by frosts. Last year several sections were visited by frosts which did considerable damage, particularly to peaches. Good crops and mining boom insure big business.

Regular January disbursements are being made in the local money market, which is going back into the banks for use again. This adds still more to the general cash by increasing the already large supply of idle money. With general rains throughout the State, insuring crops, and a mining boom on, banks are more dispersed to let out funds; but the trouble with them at this writing seems to be a scarcity of good to gilt edge commercial paper, and, so far as can be learned, there will not be much on the market, or at least not the fore part of the year. The money markets at the East are working easier, as they should under heavy disbursements there.

New York Silver Prices.

NEW YORK, Jan. 13. — Following are the closing prices for the week:

Mexican Dollars nominal	47@—

SILVER.—The market advanced, but today was lower in New York and higher in London. It is the belief that if China's new loan goes through that country will take considerable silver. The New York *Wall Street Journal* says that the demand for silver seems to come from India and more recently from Japan. The shipments of silver during the last four weeks have been very large, and advices to silver dealers indicate that there is not likely to be much falling off at least for a few weeks to come. There is some surprise that this demand could be so large from India in view of the agitation for the gold standard there. Nevertheless, the silver in use is reported poor. The demand for coinage throughout the whole of Europe is stated to be growing larger. The fact that Japan is losing its gold makes some dealers think that even if India does go on a gold basis it will not lessen the demand for silver. The last steamer hence for China took out in silver bullion for Bombay $25,000, Hongkong $62,300, and Yokohama $28,300.

MEXICAN DOLLARS.—The market has held fairly steady, considering the falling off in the demand. The last steamer hence for China took out for Japan $158,000 worth, for China $138,383.

COPPER.—The East reports a quiet but firm market. Notwithstanding the engineers' strike in England, the consumption of copper in Europe is fully up to last year at this time. The consumption in 1898 is expected to show an increase over 1897.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12¼@—
Sheet copper	— @16½
Bolt ¾ and 5-16, 20c; ⅜ and larger, 16½	

TIN.—The market is quiet for pig. In plate there has been considerable business on spot and to arrive.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

QUICKSILVER.—The market is fairly firm. The shipments to Mexico the past week by sea aggregate 120 flasks.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market is practically unchanged. The East reports quiet but steady markets.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75 @ 5 00
Sheet	6 30 @ 6 80
Pipe	5 60 @ 6 10

IRON.—The consumption with us is expected to show a large increase over 1897. Eastern advices report the largest placement for 1898 delivery of pig yet recorded. Notwithstanding this prices are unchanged, owing to the very heavy output—larger than ever.

AMERICAN.	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50
ENGLISH.		
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

SHOT.—The market is steady.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

COAL.—The market is firm, with a continued good demand ruling for both house and steam. The exceptionally long spell of cold weather has caused a heavy consumption. Rains the past week will cause more ships with coal to head this way for next season's wheat crop loading. Receipts of coal for the week ending with Tuesday were as follows in tons: Comox, 7460; Nanaimo, 8389; Departure Bay, 4800; Puget sound, 14,813; Newcastle, N. S. W., 3772; total, 39,415.

COKE.—The market is well supplied, bu no lower prices are reported. Imports the past week aggregate 1197 tons from Newcastle, England.

The market is quoted as follows:

Gas Companies'	— — @ — —
English, to load	— @ — —
" spot, in bulk	11 00 @ — —
" in sacks	12 00 @ — —
Cumberland	10 00 @ — —

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is firm with a good demand ruling.

The market is quoted as follows:

Refined, in carload lots, in barrels	6
Refined, in carload lots in sacks	5¾
Powdered, in car lots	6¼
Concentrated, "	5½

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

POWDER.—The market is firm at current quotations.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

Chemicals.

There are signs of reviving business, but no marked increase is looked for until February, and until this comes there will probably be no change in quotations. The East reports no changes, with quiet markets for all chemicals except nitrate of soda, which has been in good demand at firm prices, both for spot to arrive and for shipment.

CYANIDE OF POTASSIUM.—The market is steady.

Our market is quoted for chemical pure 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1¼c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6¼@7c per pound in carboys.

BONEASH.—There is a slow demand.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firmer.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steadier at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA. — The market is quiet, with a firmer tone.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Jan. 13, 1898.

The market held up last Friday, but Monday there was an easier tone in the morning, with light business both on and off call, which was followed by freer offerings by chippers, that resulted in lower prices. Tuesday the market shaded off still more, which caused lower prices Wednesday morning, but at the 2:30 session a steadier tone set in with Sierra Nevada stiffening. During the shading off, Occidental not only held up but moved up slightly, closing firm, with the tendency upwards, owing to confirmed reports that the mine is looking better. A strike of ore is looked for within the next fortnight or two. On the Comstock the situation in several of the mines is far from discouraging; this is particularly the case in Sierra Nevada, Justice and two in Gold Hill. They ought to strike ore in both Sierra Nevada and Justice in February, but, to discourage buying by outsiders, Sierra Nevada may be assessed, as may several others. This opinion is based on experience, that when the market is down and a pool is preparing for a deal, they do everything imaginable to get holders to sell and keep other outsiders from buying. The work in Con. Virginia is reported quite favorable, but talk of assessment is against the shares. There is one thing morally certain, and that is mill owners will have ore in the different groups uncovered before spring passes, so as to keep the mills running, but it is equally as certain that outsiders will not get any of the proceeds from the bullion, for this is one of the perquisites in consideration of uncovering the ore so as to promote better prices for shares. Yet if the public do not buy on the advance, but sell, then the manipulators may be compelled to put prices to higher figures than contemplated. The very large disbursements in this city this month, with trade and crop prospects good, will be instrumental in promoting better prices for shares, particularly with active exploiting of the mines under way.

The news from the Comstock mines officially is not materially changed from last week's advices, but reliable private information is more cheerful and speaks hopefully of two or more ore strikes in the near future, but as to the extent of the ore no opinion is ventured. A south drift has been started in Utah from the end of the northwesterly crossdrift. At last advices it was in favorable formation. Necessary repairs are said to be completed in Sierra Nevada, and work resumed at different points. The downward continuation of the ore found above is expected to be struck within three or four weeks. In Union the work that is being done is unimportant; it seems to be of a kill-time character. They are still going east in Mexican. It looks as if they ought to be through blocking out and killing time, and, incidentally, financially killing off outside holders, and commence work to run for the ore reported to exist in the mine. They are still going west in Ophir on both the central tunnel and 1000-foot levels. In doing this they follow Horace Greeley's advice to go west. The formation in both west crossdrifts is favorable, although the vein matter assays only 50 cents a ton. In Con. Virginia active exploiting is continued on the 1550-foot, 1650-foot and 1750-foot levels with favorable indications, particularly on the latter level, where some bunches of good ore are being found. Work in Best & Belcher and Gould & Curry will be resumed as soon as repairs to the Bonner shaft are completed. The shifting of ground on the Comstock necessitates almost continuous repairing in all the mines, and is a source of large expense, which accounts for the expenditure of much of the money. In Savage the work is practically the same as reported last week. It is in the right direction. No work in Hale & Norcross. The joint repairs by Chollar and Potosi indicate that the foundation is being laid for extensive exploiting work in both mines the coming spring and summer. Repairs are being made to the main incline so as to put it in good order as far down as the 1600-foot level. They are still running a joint Potosi-Bullion drift south. East crossdrift No. 1, above the tunnel level in Potosi, is in 20 feet. The vein matter is low grade. The Crœsus shaft in Bullion is being repaired and retimbered. They are down over 110 feet. After this is through with and work resumed, it will be watched with interest by mining men. They will be ready soon to commence active exploiting work in Alpha. At present they are engaged in repair work. In Con. Imperial the work is the same as heretofore reported. It looks as if the long west crossdrift will drain all of Mount Davidson above that level. The water to the west has been a serious difficulty, but it has been tapped now at the more important points, so that west workings will not be interfered with from this source. Nothing new comes to hand from Confidence or Challenge. There are favorable reports from Yellow Jacket, but a pending assessment makes operators shy of the shares. Active exploiting work is reported in Belcher and Crown Point. There are those who are quite confident that a body of ore will be struck in one of them before spring passes. Justice is proving to be strongly mineralized. They expect to strike the ore they are running for in about two or three weeks. Nothing new from Alta.

News from the Brunswick lodes report active work being done towards the west. The different managements seem to be inspired by more confidence in good results since the expert's report on that lode. The joint work by Con. Virginia, Best & Belcher and Gould & Curry is being carried on on the 600-foot level. Two west crossdrifts and one east crossdrift are being run. The formation to the west is now favorable. In Chollar they are running two west crossdrifts, one on the 200-foot level and the other on the 500-foot level. On the 600-foot level they are running an east crossdrift. In Potosi they are running a joint west crossdrift on the 500-foot level. In Occidental they are running a west crossdrift on the 350-foot level. They are running an east crossdrift on the 650-foot level and running south on the 750-foot level along the east side of the ore body.

The following illustrates the changes of the week:

Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 3rd day of January, 1898, an assessment (No. 12) of 9 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1898, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

THE SAVAGE MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 6th day of January, 1898, an assessment (No. 34) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. B. HOLMES, Secretary.

Office—Room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Humboldt County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 29th day of November, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name	No. Cert.	No. Shares.	Amt.
Harvey M. Binckley	2	1	5 00
Alice E Binckley	20	4	20 00
Alice E. Binckley	23	20	100 00
Alice E. Binckley	24	20	100 00
Alice E. Binckley	25	20	100 00
Alice E. Binckley	26	20	100 00
Alice E Binckley	39	1	5 00
Alice E. Binckley	40	2	10 00
Caroline S. Townsend	18	20	100 00

And in accordance with law, and an order from the Board of Directors, made on the 29th day of November, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the corporation, 125 Beale street, San Francisco, California, on SATURDAY, the 29th day of January, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from B. Freccero, in the Frazer and Swank Gravel mine at Washington Ranch, Calaveras Co., to deposit tailings in an old pit; from Manuel Silva and Joseph Enos, in the Cherokee Flat mine at Cherokee, Butte Co., to deposit tailings on a flat below the mine; from J. Lagomasino, in the Grizzly Bear Placer mine near Johnsville, Plumas Co., to deposit tailings in Squirrel creek; from Paul Zerga et als., in the Last Chance Placer mine near Sierra City, Sierra Co., to deposit tailings on a flat below the mine; from T. T. Kirkham, in the Mt. Vernon mine near Nevada City, Nevada Co., to deposit tailings in Mt. Vernon ravine; from William Ross, in the Clark mine near Oleta, Amador Co., to deposit tailings in Deadman's creek; from Chas. E. Wise, in the White Oak mine near Colfax, Placer Co., to deposit tailings in Live Oak ravine; from John Solari and Joe Devencenzi, in the Red Gulch and Mahala Flat Hill mines near Volcano, Amador Co., to deposit tailings in a ravine below the mines; from J. F. and M. H. Goodman, in the Bicknell mine near Volcano, Amador Co., to deposit tailings in the North Branch of Sutter creek; and from S. R. Hackley, in the Indiana and Gold Bug mine near Omo Ranch, El Dorado Co., to deposit tailings in Perry's creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on January 17, 1898, at 1:30 p. m.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

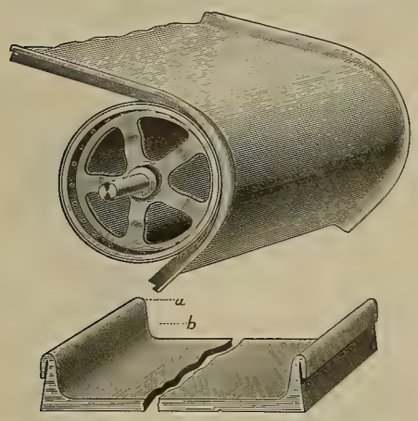
Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Skeleton Mining Report.
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts

Stamp Milling of Gold Ores.
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

DEWEY, STRONG & CO.,
PATENT SOLICITORS,
330 MARKET STREET, - SAN FRANCISCO, CAL.



Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY,
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintdenent.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

The Huntington Mill is so well and favorably known among mining men throughout the world that any description of it would seem superfluous. They are in use in the United States, Canada, Mexico, Central and South America, Australia, China, Japan and South Africa—in fact, wherever mines exist, and have given the best satisfaction of all quartz-crushing mills. The construction of this Mill has lately been much improved and we claim it to be the cheapest, most efficient, simplest and most durable Mill upon the market. Catalogue upon application.

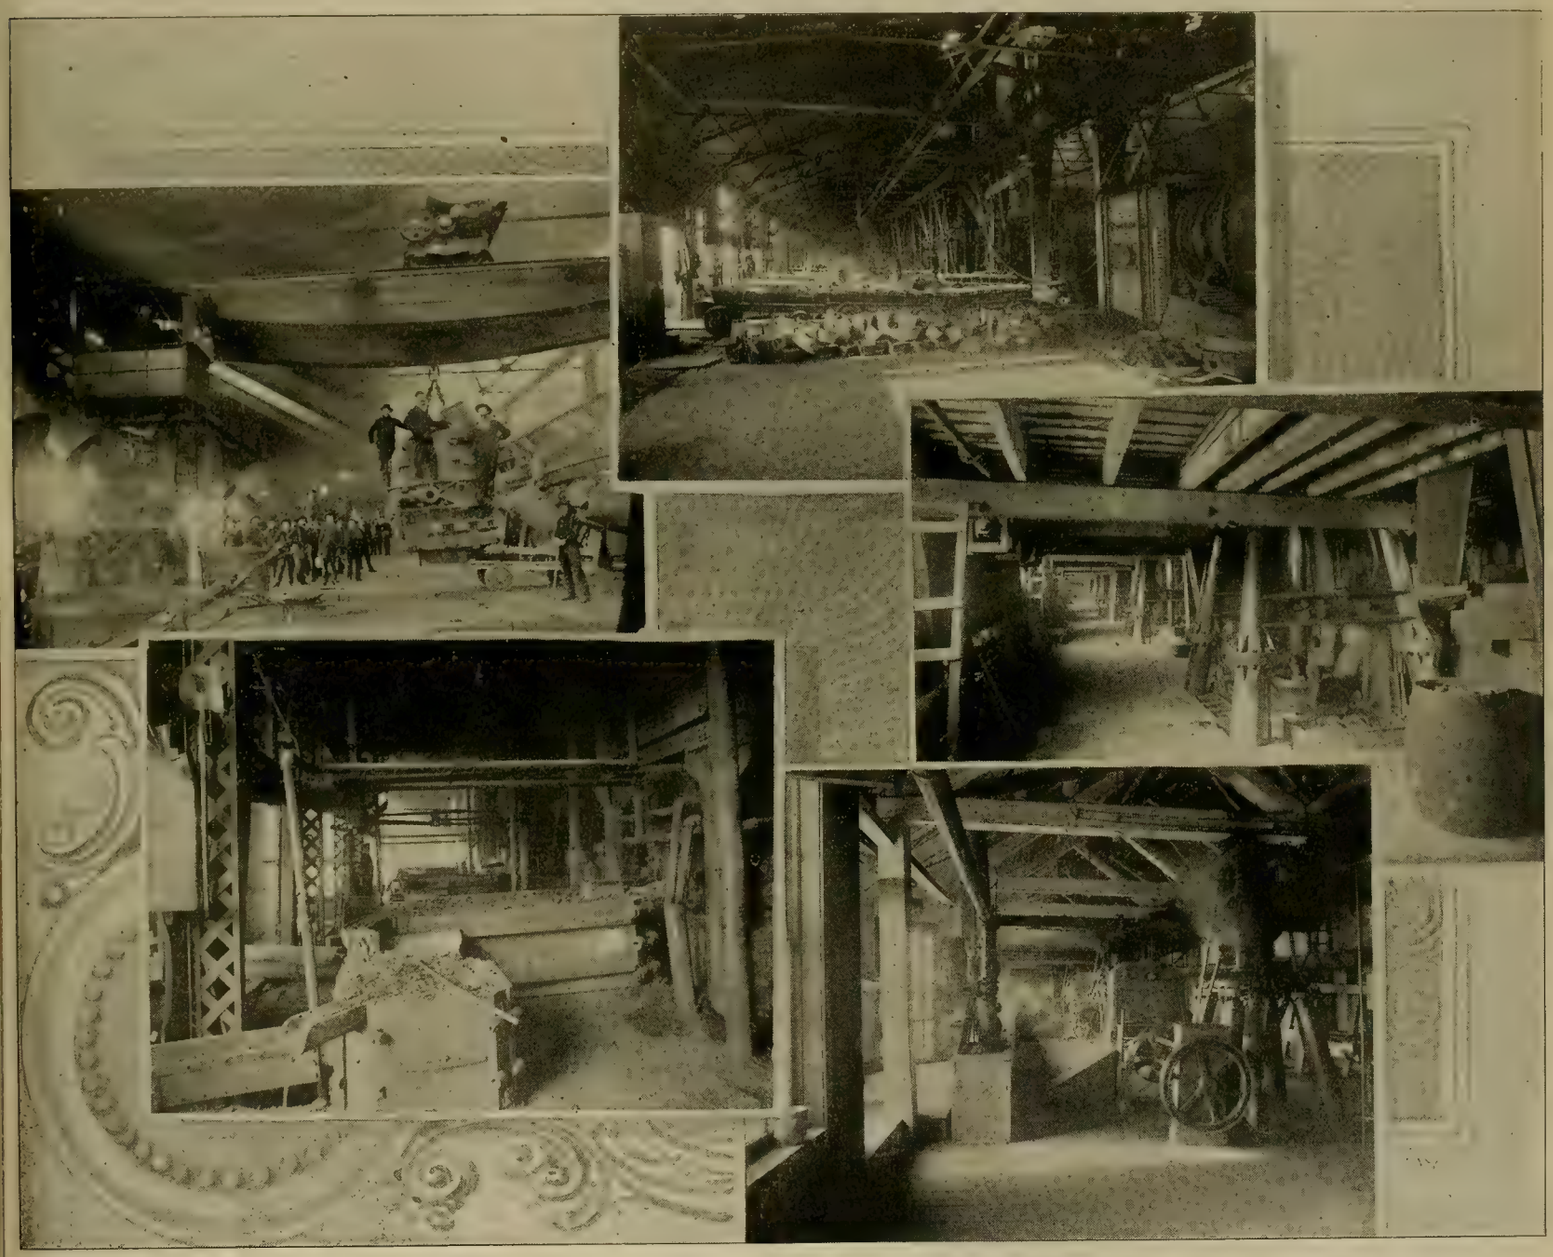
MINING AND SCIENTIFIC PRESS.
AND PACIFIC ELECTRICAL REVIEW.



No. 1959.—VOLUME LXXVI. Number 4. SAN FRANCISCO, SATURDAY, JANUARY 22, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Smelting Plant at Anaconda, Montana.

Herewith is presented, through the courtesy of the Butte *Miner*, some interior scenes of the smelting plant at Anaconda, Montana. In a region noted for big producers, the Anaconda is prominent because of the great magnitude of its operations. From July 1, 1896, to July 1, 1897, the average daily output of the Anaconda group of mines was 3600 tons. The group comprises the Anaconda, St. Lawrence No. 1, St. Lawrence No. 2, High Ore, Green Mountain, Buffalo, Mountain Consolidated, Wake-up-Jim, Bell, Diamond, High Ore No. 2 and Never Sweat. The High Ore and Green Mountain are each 1700 feet deep; the others vary from 1200 to 1600 feet in depth.

The product of these mines is treated in the company's smelters at Anaconda, twenty-seven miles from Butte, and is transported to the works by the train load. The largest locomotive ever built lets the loaded cars down on the hill line from the mines to Rocker, and other locomotives there haul them to Anaconda. The smelting plant is complete in every detail, and furnishes employment to about 2000 men. The company's mines at Butte provide work for between 1500 and 1600 men. During the year the company has paid over $3,000,000 in dividends, and is about to pay another of nearly a million more. Although some of the Anaconda mines are being worked to a fairly good depth, the ore seems to grow richer and the veins wider as they go down. It is understood that the vein of the Never Sweat at the 1200-foot level is nearly all copper glance. The ore of all the Anaconda properties carries a large percentage of both gold and silver—more of the latter than the former, silver at the Anaconda being a "by product."

The great event of '97 in Butte was the pushing deeper of the shafts through which are now hoisted over 5000 tons of ore daily. It had long been prophesied that no mine in that district would pay below the 1000-foot level. There are now twenty mines in Silver Bow county being worked at a greater depth than 1000 feet. Of forty copper-silver mines in and about Butte three are being worked at a depth of 1400 feet, six at 1500, two at 1700, four at 1000, three at 1200 and one at 1600.

IT would be good business in every way to have the mineral exhibit at the Golden Jubilee Mining Fair in this city transferred intact to the Trans-Mississippi Exposition at Omaha. No better advertisement could be secured, and California owes it to herself and to the mining industry to be properly represented with her sister States at that great gathering.

GOV. BUDD has issued the following proclamation: "It is contemplated that the fiftieth anniversary of the discovery of gold in California be celebrated on the 24th day of January, A. D. 1898. Recognizing the significance of that event, and the influence which that discovery has exercised upon the destinies of California and the history of the world, and having been thereunto requested, I, James H. Budd, Governor of California, do hereby proclaim and appoint Monday, January 24th, A. D. 1898, a legal holiday."

THE NATION, the State and the city combine to celebrate next Monday, the 24th inst., which has been selected as the day on which to begin the commemoration of the fiftieth anniversary of the discovery of gold by Marshall in this State. The details have all been arranged, and, if the weather be fine, the parade will be the largest ever seen in San Francisco. From every fort in the harbor will be fired the national salute. On one of the handsomest thoroughfares in America will march several thousand men, representing every social, civic and military organization in the State. The extent of the parade can be judged from the simple statement that, while it is to move promptly at 10:30 A. M., it is thought that the last division will not disband until 4:30 P. M. In the line will appear the largest number of United States troops ever seen on parade at one time in San Francisco, there being eight companies of infantry, eight of artillery and four troops of cavalry. The mining associations, the Pioneers, the Native Sons, and social organizations to the number of many thousands; floats, banners and music, will combine to form a most attractive display. This will be but the beginning of a week of festivities of various natures in commemoration of the great event. On the 29th begins the Golden Jubilee Mining Fair at Mechanics' Pavilion in this city, which will continue until March 6th, and which deserves to be visited by every one directly or indirectly connected with mining interests. Whether experienced or not, every miner will find much in that great building of value to him. It is the intention to have it an epitome of mining from the earliest '49 methods to the latest improved processes of the day. More especially to anyone contemplating a trip to the Yukon region, the exposition will be a school of instruction. The continued, united and earnest efforts of those well qualified to handle such an enterprise justifies the assertion that the entire project will be a success.

Need for a Secretary of Mines and Mining.

House Resolution 5861 was introduced in the House of Representatives, January 6, 1898, by Congressman Barham of California, and referred to the Committee on Mines and Mining.

A Bill to Create an Executive Department of Mines and Mining:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that there shall be at the seat of government an executive department to be known as the "Department of Mines and Mining," the general design and duties of which shall be to acquire, by examination, practical and scientific experiments, geological research, or otherwise, useful information on subjects connected with mining in the general and comprehensive sense of the word, and to diffuse same among the people of the United States.

SEC. 2. That said department shall be under the supervision of a Secretary of Mines and Mining, who shall be appointed by the President, by and with the consent of the Senate; and section one hundred and fifty-eight of the Revised Statutes is hereby amended to include such department, and the provisions of title four of said Revised Statutes, including all amendments thereto, are hereby made applicable to said department.

SEC. 3. That there shall be in said department an Assistant Secretary of Mines and Mining, to be appointed by the President, by and with the advice and consent of the Senate, who shall perform such duties as may be required by law or prescribed by the Secretary thereof.

SEC. 4. That the Secretary of Mines and Mining shall receive the same salary as is paid to the Secretary of each of the executive departments, and the salary of the Assistant Secretary of Mines and Mining shall be the same as that now paid to the First Assistant Secretary of the Department of the Interior.

SEC. 5. That the duties now imposed by all laws and parts of laws relating to mines and mining affairs exclusively upon any existing department of the Government, or any division or bureau thereof, shall, on and after the day this act takes effect, be performed by the Department of Mines and Mining.

SEC. 6. That the Geological Survey is hereby transferred to the Department of Mines and Mining.

SEC. 7. That the sale of the mineral lands of the United States shall be conducted under the auspices of the Department of Mines and Mining.

SEC. 8. That on the organization of this department all officers and employes wholly engaged in official work in any department of the Government, or any division or bureau thereof, engaged in the performance of the duties referred to in section five of this act, and all such employed in the departments referred to in sections six and seven hereof, shall be transferred to the Department of Mines and Mining.

SEC. 9. That all records, maps, documents, instruments, surveys, machinery, and other materials now in the possession and use of any existing department of the Government, or any division or bureau thereof referred to in sections five, six, and seven of this act, are transferred to the Department of Mines and Mining.

SEC. 10. That this act shall go into effect on the fourth day of March, eighteen hundred and ninety-nine.

There is immediate and pressing necessity for the creation of a new department in the Cabinet—a Secretary of Mines and Mining. The idea is not a new one; the need of its existence has long been recognized, and at times has been urged upon the attention of the public and our national legislators.

Upon the prosperity of the mineral industry primarily rests the prosperity of any country; anything that tends to foster and encourage this industry is within the province and should be a part of the purpose of a well-regulated government, of whatever form it may be. The value and extent of the mining industries of this nation are of sufficient importance to justify the creation of a position in the Cabinet, to be filled by a Secretary of equal rights and privileges with the other Secretaries.

The total value of the mineral production in 1894 was $581,211,258; for 1895 it aggregated $678,001,934; for 1896 it totalized $742,770,878; for 1897, $762,061,106. These few figures graphically illustrate the importance of the industry which is at present totally unrepresented in the Cabinet of the nation. It is only by the creation of a Department of Mines and Mining and the appointment of a Secretary that the mineral industry of this nation can be appropriately represented. The creation of the Cabinet of the President of the United States has been a matter of evolution. In the infancy of this country the Cabinet consisted of three members—Secretary of State, of War and of Navy. We now have in addition, Secretary of Interior, Attorney-General, Postmaster-General and Secretary of Agriculture; we should have a Secretary of Mines and Mining. If the agricultural interests of this country justify a Secretary, the mining industry of the country is equally entitled to such representation.

Anyone who has had anything to do with mining legislation, or with the vast and varied interests directly and indirectly connected with mining in this country, realizes how inadequately represented this great industry is. As at present constituted, the only Cabinet connection that this Government has with its great basic industry is a subordinate official in the land department, the land department occupying a subordinate position in the office of the Secretary of the Interior.

Every one knows the lamentable result of such inadequate representation; the rulings adverse to the miners by men who are not to be blamed for not knowing anything about the points upon which they are ruling; contradictory decisions; the constructions of law in one part of the department that were construed precisely opposite in another office; the constant clash of superiors and inferiors, and the evident embarrassment which such style of work entails upon the office in which it originates—are all matters of public regret. In this regard the action of our country is in painful contrast to that of other countries, which, while less progressive in the main, in this instance certainly evince better understanding of existing requirements. We are behind other civilized nations. On the continent of Europe are Government departments of mines and mining under men whose sole duty it is to attend to that great industry, to foster and protect it; and the result of such governmental provision is effective and satisfactory to the citizens of those countries and beneficial to the nations fortunate enough to have such departments of mines and mining.

It is not a question of expense, but of economy. No more economical action could be devised than the creation of the department suggested. It is the duty of the Government to see that the great sources of national wealth are not wasted. Millions upon millions have been irretrievably lost by reason of the neglect that has resulted from the lack of such representation as that urged. The cost would be trivial, and purely as a business proposition there is nothing before the American people sounder in policy or more appropriate from an economic point of view than the creation of this department. It is not a local question; it affects the entire nation; it is as broad in its requirements as the geographical limits of our whole country. There is a general realization throughout the United States of the justice of this proposed measure. Everywhere it is mentioned spring up friends and earnest advocates, for every one realizes how necessary it is that the industry which lies at the base and upholds the other industries of the nation should have appropriate representation in that nation's cabinet.

A MATTER of some interest to California miners terminated last week. The Government had brought suit against the Central Pacific railroad and sundry Butte county residents to secure a reversion of a section of mineral land in that county. In 1866 the public land commissioner granted the land to the railroad company as agricultural land. The company subsequently sold it to the Butte county men, who were made general defendants in the suit, and who developed large mining interests thereon. The Government, through its lawyers, asked that the patent be cancelled by reason of error on the part of the land commissioner, as the land was evidently mineral and not subject to the terms of the original grant. It was further held that the defendents were acquainted with this fact and that they also owned mines in the immediate vicinity of the lands under dispute. The counsel for the Government maintained that this error of the land commissioner could be corrected and that the original patent to the railroad company could be cancelled, which was the view held by Judge Morrow in deciding the case.

DURING the week sufficient rain has fallen in the foothills of the State to practically overcome the serious drought and cold of the preceding two months, which almost entirely cut off water supply and caused the cessation of considerable mining.

Answers to Correspondents.

A mining claim is open to relocation. The only work done on it for the year 1897 was the surveying of said claim preparatory to applying for a patent. Will the surveying hold said claim as assessment work done? The patent has not been granted. Notice of publication has not as yet appeared in county papers. M. S.
White Hills, Arizona.

Neither surface nor underground surveying will count as development work.

J. F. C., Groveland, Cal.: The deepest shaft in the United States is the Red Jacket, Calumet & Hecla, Lake Superior, a little over 4900 feet. The shaft in the Tamarack mine, same district, is 4500 feet deep. The deepest shaft in California is believed to be the Kennedy. Amador Co., 2200 feet, though the Idaho, Nevada Co., and the Sierra Buttes, Plumas Co., are almost the same depth. The deepest shaft in Colorado is the California, 2150 feet; the Geyser, Silver Cliff district, Colo., is almost as deep. The map of the Comstock lode, published on page 55 of last week's issue, graphically answers the remainder of "J. F. C.'s" inquiry.

The annual assessment work required by U. S. law is not performed during 1897 upon claim upon which are buildings and machinery put there for mining purposes. The claim is relocated Jan. 1, 1898. Does the relocator become the owner of the buildings and machinery attached to the surface of the claim, if his title to the claim proper is sustained? H. L. C.
San Diego, Cal.

No; he does not. Failure to comply with any Government requirement affects only the title to the mine itself.

"A" has located a placer claim and has done his assessment work, etc., to comply with all requirements. "B" locates a quartz ledge on said placer claim. Can "B" hold this location, or does a placer location hold all ledges within its boundaries, the location being on unpatented ground? T. R.
Smartsville, Cal.

As stated, "B" can locate and hold the claim. Section 413 of Lindley on Mines lays down the law and cites the authorities: Until an application for a placer patent is filed, any one may locate the lode within the placer, provided there is a *bona fide* discovery of such lode and the location is made peaceably and without force. A placer *patent* carries all lodes not known to exist at the date of the patent application; but a lode discovered within the limits of a placer at any time prior to such application may be located by anybody, and the placer location to this extent must yield to the lode location.

R. W. D., Auburn, Cal.: Under the present California law within sixty days from the date of the discovery of a vein or lode the discoverer must perform $50 worth of labor in developing his discovery, and distinctly mark his location on the ground so that its boundaries can be readily traced, and must file in the office of the county recorder of the county in which the claim is situated a certificate of location, which said certificate shall state the name of the lode or claim; the name of the locator or locators; the date of discovery and posting of the notice provided for in section two of this act, which shall be considered as the date of the location; a description of the claim, defining the exterior boundaries as they are marked upon the ground, and such additional description by reference to some natural objects, or permanent monument, as will identify the claim; a statement that such certificate is the final or competed notice of location, and that he has performed the aforesaid $50 worth of labor in development work thereon within the aforesaid sixty-day period, stating generally the nature thereof. Said certificate shall be dated and signed by or on behalf of the locator or locators, and verified by them or by some one in their behalf, and when filed for record shall be deemed and considered as prima facie evidence of the facts therein recited. A copy of such certificate of location, certified by the county recorder, shall be admitted in evidence in all actions or proceedings with the same effect as the original. The performance of such labor shall be deemed a necessary act in completing such location and a part thereof, and no part thereof shall inure to the benefit of any subsequent location.

The discoverer of placers or other forms of deposit, subject to location and appropriation under mining laws applicable to placers, shall locate his claim in the following manner: First—He must immediately post in a conspicuous place at the point of discovery thereon a notice or certificate of location thereof, containing the name of the claim; the name of the locator or locators; the date of the discovery and posting of the notice hereinbefore provided for, which shall be considered as the date of the location; a description of the claim by reference to legal subdivisions of sections, if the location is made in conformity with the public surveys; otherwise, a description with reference to some natural object or permanent monument as will identify the claim, and where such claim is located by legal subdivisions of the public surveys such locations shall, notwithstanding that fact, be marked by the locator upon the ground, the same as other locations. Second—Within thirty days from the date of such discovery he must record such notice or certificate of location in the office of the county recorder of the county in which such discovery is made, and so distinctly mark his location on the ground that its boundaries can be readily traced. Third—Within sixty days from the date of the discovery the discoverer shall perform labor upon such location or claim in developing the same to an amount which shall be equivalent in the aggregate to at least ten dollars' ($10) worth of such labor for each twenty acres, or fractional part thereof, contained in such location or claim. Fourth—A failure to perform such labor within said time shall cause all rights under such location to be forfeited, and the land covered thereby shall at once be open to location by qualified locators other than the preceding locators, but shall not in any event be open to location by such preceding locators, and any labor peformed by them thereon shall not inure to the benefit of any subsequent locator thereof. Fifth—Such locator shall, upon the performance of such labor, file with the recorder of the county an affidavit showing such performance, and generally the nature and kind of work so done.

J. B., Los Angeles, Cal.: J. B. Reinstein, 217 Sansome St., San Francisco, will furnish upon application full particulars of the international competition for plans for buildings, etc., for the University of California. The sum of $20,000 is available for such plans.

W. A., Stateline, Nevada: A good way to free copper plates from gold is to put them over a charcoal fire and slowly evaporate the quicksilver. The plates should be cooled gradually, then rubbed with muriatic acid, put in a damp place over night, then rubbed with a solution of sal ammoniac and saltpeter, and slowly heated over a thin red fire, but not allowed to get redhot. When the gold scale blisters the plates should be taken from the fire and the gold scraped off. Where the gold has not blistered should be treated with the solution and again fired. Collect the gold scales in an earthen dish, cover with nitric acid till all the copper is dissolved, when the gold can be smelted; after melting, corrosive sublimate should be used in the crucible till a blue flame ceases to burn.

S. J. S., Randsburg, Cal.: One can locate as many mining claims as he or she may be able to hold by proper development work. One can take up but one timber claim, under the law of 1878, and can use the pre-emption or homestead right only once; but this restriction does not apply to mining claims.

F. G., Rossland, B. C.: The following from the *Mining and Industrial Reporter* answers your question: To make canvas waterproof, dissolve one part of genuine beeswax in two parts of gasoline. Rapidly paint this on the canvas. The gasoline evaporates in a few minutes, leaving the beeswax in the fibers of the canvas, making it thoroughly waterproof. This method is cheap and very quick. Care must be taken that genuine, pure beeswax is used, as the cheap article will not do. The operation must not be done near fire or flame of any kind. It should be done in the open air. If done in a room where there is a flame or fire, even a lighted cigar, a dangerous explosion is almost sure to be the result.

C. B. H., Butte, Montana: In the recent publication, "The Law of Mines and Mining in the United States," by Barringer & Adams (1897), the following facts are given for the benefit of locators of mining claims: To enable any deposit of valuable ores or other mineral substances to be located as a lode claim, or, more accurately, to possess all the legal attributes of a true lode, there must always, in the opinion of the authors, be shown to exist a reasonable continuity of ore, or the accompanying mineral matter (gangue), presumably formed at the same time and by much the same agencies as the ore, both occupying some reasonably well defined main channel of mineralization, or there should at least be, in the judgment of trained and educated mining men of practical experience, a reasonable expectation of such continuity of ore. If the continuity and regularity cannot be shown to exist, and the expectation of it can be shown to be unreasonable, the deposit, in the authors' opinion, should be located as a placer claim, and the laws governing this class of claims should apply. The following is a legal, but not a geological or mineralogical, classification:

I.—*Stratified Mineral Deposits.*—A.—Regular: (a) Non-metallic—Coal, fire clay, asphalt, salt, gypsum, alum, potash, graphite, infusorial earth, quarries of stratified rocks, Chili nitrate, etc. (b) Metallic—Iron, manganese, aluminum, gold, tin, and platinum gravels. B.—Irregular: (a) Non-metallic—Asphalt, petroleum, natural gas, alum, banxite, borax, potash, phosphate rock, guano, quarries of rock not sedimentary, mineral paints, sulphur, etc. (b) Metallic—Iron, manganese, aluminum. Should be properly located when on Government lands, according to statutes governing this particular kind of deposit; or generally in the absence of such, or when not found to be in true fissure veins or as regular contact deposits in placer claims, and the law governing this class of deposits should apply.

II.—*Unstratified Mineral Deposits.*—A.—Regular: (a) Fissure veins or true lodes. (b) Regular or continuous contact deposits. Should be located as lode claims and the law governing this class of deposits should apply. B.—Irregular: (a) Discontinuous contact deposits. (b) Isolated deposits on limestone, etc.; also, terminable spurs or offshoots from lodes. (c) Stock work (when irregular, discontinuous and pockety). Should be located as placer claims, and the law governing this class of cases should apply.

A list of the more important minerals and metals which possess commercial value is also given by them, viz.:

Non-Metallic.—Alum, anthracite coal, asbestos, asphalt, barytes, bauxite, bituminous coal, borax, bromine, building stone, calcspar, cement, chromic iron ore, clay deposits (fire clay, brick clay, etc.), coal, corundum (emery), feldspar, flint, fuller's earth, fluorspar, graphite, gypsum, infusorial earth, iodine, lignite coal, limestone, magnesite or dolomite, marls, mica, mineral paints, mineral waters, monazite, natural gas, nitrate of soda, ozocerite, petroleum, phosphate rock, potash, precious stones, pyrites, rutile, salt, silica or quartz, soapstone, sulphur, talc.

Metallic.—Aluminum, antimony, arsenic, bismuth, chromium, cobalt, copper, gold, iron, lead, manganese, mercury, nickel, platinum, silver, tin, tungsten, zinc.

J. E. H., Los Angeles: Antimony occurs in California chiefly in Kern county. There is a mine three-quarters of a mile north of Havilah, at an altitude of 3400 feet, in which the ore, stibnite, occurs in irregular masses in a mineralized zone in the porphyry. Another is the Bousby mine, near the head of San Emidio canyon. The third is a group of small mines on Erskine Creek. The Grace Darling, Padre and San Emidio are also of some importance. The latter consists of nine claims in the southwestern part of the county. The ore averages 40% antimony, and carries silver, iron and arsenical pyrites. George Aitken has a mine about twenty miles from Mojave, and is now shipping to San Francisco antimony ore by the carload, which runs 55%. His is the only antimony mine at present operating in this State at a profit of which we are cognizant. His ore is sent to Mathison & Co., Staten Island, and goes by way of Cape Horn from this city. Mathison & Co. have not removed their smelter to San Francisco. There was what was called the Chaps Smelting Co., which removed from here some time ago; but it has recently been reorganized here under the name of the Chapman Smelting Co. Deposits of antimony are likewise found in Inyo county, on the west slope of the Panamint range, three miles south of Wild Rose Springs; also in Riverside county, three miles south of Riverside, where considerable stibnite of excellent quality has been taken out. In San Benito county, the Ambrose antimony mine is in the McLeod district. Here the ore occurs in a bunchy vein, varying in width from a streak to 2 feet, and is enclosed in quartz trachyte, the antimony being next to the hanging wall. This deposit is chiefly remarkable for the beauty of its crystallized masses. It yields about 50% of metallic antimony. In the Appeal mine, in the same county, the Gleason and the Star sufficient has not been found to justify working at higher than present rates. In San Luis Obispo county, on San Simeon creek, considerable antimony has also been produced, this deposit appearing as a short, bunchy vein in sand-stone. The Selby Smelting Co., of this city, handle only metallic antimony. So far as this paper is able to learn, the chief drawback to development of California antimony mines is the cost of transportation.

In working the assessment work of $50 under the new law, how many days' work will be necessary to comply with the law? or in other words, how many dollars a day is allowed in working assessment work? T. R. J.
Petaluma, Cal.

There is nothing specified in the law as to how many days' work is necessary, nor are the rates of a day's work stated. In this case it is customary to reckon the going wages in the locality—in Sonoma county it being $2.50 per day for miners.

Mills That Grind Slowly.

River improvement moves slowly and not wholly satisfactorily, but from the sluggish progress of events it seems possible that the original plan will be carried out, and that the work as indicated by Col. Mendell fifteen years ago will be taken up. General Wilson, Chief of the United States Engineers, in his report gives encouragement to the idea, wherein he says: "This matter of erecting restraining barriers is the most important feature of the scheme for improving the rivers, as only by such plans will it be carried forward. The Engineer Department will do everything in its power to forward river improvement work."

Some disquieting statements are made by General Wilson regarding appropriation matters, if correctly reported. General Wilson says, referring to the $250,000 joint appropriation made by California to aid and supplement the United States $300,000 appropriation in carrying on such construction as the United States Debris Commission of the State of California may approve: That while Congress has made the necessary enactment to enable the United States Government to receive that State appropriation, yet it has not been turned over to the Federal Government. It is to be hoped that Gen. Wilson is misquoted. It would be unfortunate were the Chief of the United States Corps of Engineers to get mixed up on this point, which is a very plain one, the only tangle being the interminable length of time that seems to be required to do anything in this matter. The California act which appropriated this money provided that whenever the United States Debris Commission had agreed upon plans and fixed upon specifications and entered into contracts for the work they deemed requisite, that the State Debris Commission should examine the same and report to the State Board of Examiners; and upon approval by that body as the work progressed the Federal Commission could draw upon the State Treasurer for money from time to time to the extent of $250,000; the expenditure of the money, certifying to its being due, etc., all to be under the control of the Federal Government.

As there has been no plan agreed upon, as the preliminary work is still in progress, it is not believed that any question need arise as to the turning over of the State money to the Federal Government. Such question has not heretofore arisen. The matter was so thoroughly understood as a joint proposition, and has been so thoroughly gone over heretofore, that it seems unnecessary to recount it all again at this time. As a matter of fact the work should be going on and payments made. How not to do it has heretofore seemed the rule. Meanwhile the untoward conditions that rendered all this appropriation necessary continue, and valley and mountain are unanimous in a desire that talk should cease and work begin. The money is ready and has been ready for years, and all this hemming and hawing and backing and filling is tedious and discouraging to those who have aided in securing the appropriation and to all who realize the absolute and immediate necessity of the work.

English Investments in American Mines.

To the Editor:—As a regular reader of your very valuable paper, I take this opportunity of saying that the editorial pages of your issue of the 27th ult. have been thoroughly appreciated by many of your subscribers on this side, and it is to be hoped that the comprehensive and admirable manner in which you have alluded to the subject "English Purchasers of California Mines" will be the means of helping to revive an interest in California mining ventures, that has for a long time now and until recently been but indifferently indulged in here. As you aptly say, "the question of the purchase of a mine is just as much a matter of scientific mining as anything else in connection with the industry," and, in corroboration of this, I find in your issue of the 4th inst., under the heading of "M. E's., E. M's. and Experts," the following very "fitting" sentence: "And let it never be forgotten that the mining engineer who is a commercial failure cannot be more than a very partial technical success." Your special reference to the term "prospect" and to the wider latitude that it obtains in California than that given to it here, is both interesting and instructive; but, for all that, it may, I fancy, fairly be maintained that the inclination in California is not generally prompted by your interpretation, but goes beyond it and bases values, not upon "information (knowledge) and belief," but upon "belief" only.

Now, as mining values, from a commercial view, even under the most auspicious conditions, are more or less difficult to determine equitably as between seller and buyer, would it not be an advantage if some fixed—so far as anything can be "fixed" that pertains to mines or mining—or recognized rules were applied to the value of properties coming under the name of "prospects?" For instance, a "prospect," though well located, but on which little or no work has been done, should not be valued, as such frequently is, far in excess of one not so well situated, but with much more to show in the matter of development work, and affording accordingly better opportunities for examination. I am not unmindful of the saying that the value of anything is just what it will bring; but by this method the "prospect" owner is seldom guided, for, while he expects the inquiring purchaser to increase his bid, he rarely realizes, at least until he has tired himself out waiting, that it is not impossible that his "prospect" may not be worth so much as he believes it to be, and during the time it has taken him to arrive at this conclusion he has been steadily disregarding the time-worn adage that "time is money."

In dealing with foreigners or foreign capital California mine owners invariably overlook the fact that nearly all capital looking for investment in mining adventures does so collectively, and not individually, consequently, what they (the Californians) lose sight of, or, rather, refuse to recognize, is that "collective" capital requires more in the way of inducement or encouragement to move it than is the case where individual capital becomes interested. During the past four or five years, and perhaps longer, there has been no difficulty in London for those disposed to risk money in mining ventures to loan it at from 8 to 15 per cent per annum, or, say, at an average of 12 per cent per annum on leading mining shares, with a margin on the market price of, say, 10 to 30 per cent. Now, so long as this can be done to almost any extent, it will be obvious to you that anyone here desiring to invest, say, £10 or £20,000 in mining, will prefer to put that sum out in the form of a loan against, say, the shares of a dozen different companies to simply "plumping" it in a prospect that might bring phenomenal returns in the way of profit or that might result in, not only no returns, but a total loss of the principal. It is not, however, the man with the large capital that nowadays either develops or advances any industry; it is the one with £50 or £100, who thinks he sees a chance of doubling his money by running the risk, on the "never venture never gain" theory, and as it is from such a source that money or capital for mining mostly comes, it can only be expected to come when circumstances would seem to warrant a reasonable prospect of profit on the essential preliminary costs of examination, organization, etc.

I regret to have to report that I learn privately from a friend that the shares of the Great Northern Industrial Gold Co., Ltd., (California), to which I referred in my last letter, have been but very indifferently applied for by the public. I am told that the promoters "attribute the non-success to the mine being in California and to the distrust with which mines in that State and in America are looked upon." These views may be partially, but only very partially, correct, as I am quite satisfied that had the mines in question been situated in either Africa, Australia or British Columbia, and been presented or offered to the public in the same way, the response would also have been disappointing to the promoters for the reason that there was a palpable effort on their part to push the issue on "names." The name of the company itself was a fit subject for adverse criticism, so also was the manner in which the directors and others were described in the prospectus. I hear of one or two other California mines that are to be advertised here soon with every promise of a successful outcome. RANDOM.

London, Dec. 27th, '97.

The Permanganate Gold-Recovery Process.

The permanganate gold-recovery process is attracting present attention in New Zealand, where it is deemed an improvement on the older methods of chlorination and "requires no special training or chemical knowledge in its application to suitable ores." In all previous processes of the same nature which have been generally adopted the chlorine is applied to the ore in a gaseous state. With the permanganate process there is no escape of the gas, and the liquid itself is pronounced harmless. The process is a modification of the Etard process, recently described herein. The nature of the Etard discovery was submitted to Dr. Black of the Otago, N. Z., University, who began a series of experiments to satisfy himself that in actual practice the process would accomplish what it promised in theory. The test was satisfactory, a drawback being that while one of the ingredients—hydrochloric acid—is a chemical of little or no commercial value in Europe (where it is allowed to run to waste from the alkali works), in the colonies it has considerable value. To find a cheaper substitute for this acid was the problem Dr. Black set himself to solve. He now claims to have found that sulphuric, a much cheaper acid, together with common salt in combination with permanganate of potash, will accomplish the work of gold extraction equally as well as the Etard solution and with greater rapidity. It is the Black modification of the Etard process which is now being shown to the New Zealand mining public. The ore upon which the process is shown in operation is from the Mount Morgan mine, Queensland, and is so refractory in its nature that it can only be treated successfully by chlorination. In addition to the ordinary sulphides which occur in most gold ores obtained from any depth the Mount Morgan ore contains sufficient copper to make the application of cyanide an impossibility. It is locally stated that an extraction of 92 per cent of the gold contents has been effected with the Black solution in fifteen hours by percolation and in five hours by agitation. Trials made upon bulk samples of one of the most rebellious of Otago, N. Z., ores—the blanket concentrates from the Barewood field—gave extractions of 95 per cent. These concentrates contain both antimony and manganese as well as the usual iron and arsenical pyrites.

How It Feels to be Asphyxiated.

To the Editor:—I have lately had some experience with mine gases, which came very near being fatal.

In our mine we sometimes have to contend with sulphuretted hydrogen, chlorine gas, carbonic acid gas, and marsh gas, sometimes called fire-damp; and lately have had all these to contend with at the same time and place. We had struck the ledge, finding, in addition to these gases, some petroleum, with a heavy flow of water, equal to about 4 miner's inches, when we were driven out of the tunnel by the excess of sulphuric acid gas, called by our miners sore-eye gas, owing to the fact that it affects the eyes so that the men are temporarily blind, and suffer great pain while the eyes are affected. We had discontinued work temporarily, while preparing to put in artificial ventilation. I and my brother went in to examine the tunnel. He had stopped to look at something about 250 feet from the breast. I went ahead to the breast carefully trying for carbonic acid gas along the floor with a candle, also along the roof of the tunnel for marsh (or inflammable) gas. I found neither with the light, but within a few seconds after reaching the breast, where a large flow of water was coming out of the ledge, I found that I was getting very short of breath. I tried to recover, but could not do so. My candle was burning brightly. I turned and ran back towards the mouth of the tunnel, perhaps 100 feet, at the same time calling to my brother to come to me. I began to get weak, lose consciousness, and fell to the floor. I could not rise again, although trying hard to do so. I felt just like one in a nightmare, trying to move, but unable to do so; but felt no pain whatever, not even strangling or coughing sensation. At this point my brother reached me, and pulled me back towards better air, where I revived within a minute or two. In this case asphyxia was probably caused by chlorine gas.

I have several times helped to take men who had been suffocated out of mines, and their faces and positions showed no signs of pain or any suffering. I had wondered at this, but now I know how a person might be asphyxiated while his light burned brightly, and would suffer no pain whatever to warn him of approaching danger.

PHILIP REARDEN,
Supt. Abbott Quicksilver Mining Co., of Illinois.
Sulphur Creek, California.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER II.

By Geo. F. Becker.

In a report made to the British South Africa Company, dated November, '94, Mr. John Hays Hammond describes the auriferous region of Matabeleland and Mashonaland as forming a high plateau along the main divide or watershed of the river systems of the country, being the source of the tributaries of the Limpopo and Sabi rivers on the south and those of the Zambesi on the north. This watershed trends in a northeasterly direction. The great bulk of the country Mr. Hammond reports as granite, the remainder being metamorphic schist, probably dynamometamorphosed igneous material. The schists constitute the gold belt of the country, and occur as broad bands and patches in the granite. It is chiefly in the region of intense metamorphism that the quartz veins occur, the walls usually being highly foliated chloritic schist. The auriferous belts extend for the most part in an easterly and westerly direction, with a width of from five to twenty miles. Mr. Hammond states that millions of pounds sterling worth of gold has undoubtedly been derived from the numerous ancient workings, all of which seem to be shallow. The ancients were probably unable to deal with much water or with sulphidized ores.

The gold fields of the northern portion of the Transvaal resemble those of Mashonaland and Matabeleland. The quartz veins are characteristically associated with schists and granite, and very often, according to Mr. Schmeisser, lie conformably between strata. One may perhaps suspect that schistose surfaces rather than planes of bedding have controlled the position of the veins. The schists for the most part strike east or northeast and dip steeply, as a rule, to the south. The gold fields lie at or near watersheds in the northern portion of the Transvaal, as well as in the British South Africa (or Chartered) Company's territory.

The schistose rocks of the northern Transvaal and the Chartered Company's territory are known as the Swasi schists. Their age is unknown, but it is supposed that they are Silurian. They are not dissimilar in appearance to portions of the Algonkian in the United States, and may in fact include several formations.

Along the southern edge of the auriferous Swasi area and unconformably upon it lies the Lower Cape series. It consists of numerous beds of silicified conglomerate alternating with quartzites and containing subordinate quantities of slate. Its age also is unknown, no definite fossils having been obtained from it. There is no doubt that it is Paleozoic, and a somewhat uncertain correlation with the rocks near Cape Town would assign it to the Devonian or the Lower Carboniferous. Mr. G. A. F. Molengraaff considers this series as divisible into a lower portion, which he calls the Old Schist formation, and the auriferous group, for which he retains the name Lower Cape. I saw no distinct evidence of such a division, though there is doubtless some faulting, and on Mr. Molengraaff's maps no such discordance displays itself. If it exists it would seem to be slight. His Old Schist occurs at the crest of the Witwatersrand and includes the Hospital Hill slates; it is not wholly devoid of auriferous beds.

The Upper Cape series lies unconformably upon the Lower Cape. This discordance, which I have had occasion to examine, is marked and very important to the technology of the district. The Upper Cape contains, close to its base, one auriferous conglomerate, the Black Reef, which at certain points has been successfully mined. An extensive sheet of dolomite overlies the Black Reef, and the dolomite is again overlain, in seeming conformity, by the Gatsrand series.

Overlying the Upper Cape are the coal-bearing beds of the Karoo. They are Triassic, or possibly in part Permian, and lie unconformably on the older rocks. They are nearly horizontal, almost undisturbed, and conceal the older rock over large tracts of country.

Character of the Main Reef Series.—The gold-bearing pudding stones, which make Johannesburg famous, are known as the Main Reef series, and occur in the Lower Cape formation. The gold is not confined to this formation, since the Black Reef is a member of the Upper Cape. Neither is the Main Reef series the only gold-bearing portion of the Lower Cape. All the conglomerates of this series, which is miles in thickness, seem to carry some gold, and, locally at least, some others besides the Main Reef series have proved fairly rich; but none which are yet definitely known not to belong to the Main Reef have become economically important. They have received various names, which are sometimes inconsistently applied through erroneous hypotheses of continuity. Immediately about Johannesburg the more prominent groups of conglomerates of the Lower Cape forma-

*Eighteenth Annual Report Mineral Resources of the United States.

tion, in ascending order, are known as the Main Reef, Bird Reef, Kimberly Reef and the Elsburg series. The intervals between these groups of conglomerates, measured across the croppings, are approximately 3000, 5000 and 10,000 feet, so that the Elsburg series is over three miles from the Main Reef. The distance measured perpendicularly to the stratification is, of course, much smaller and averages somewhat less than one-half of the horizontal distance. In any one section the various puddingstone beds can be distinguished by the size and color of pebbles, the appearance of the matrix and the like. Some miners think they can recognize the Main Reef series at any distance from Johannesburg by the appearance, but little faith is to be placed in such identification, inasmuch as on any continuous stratum of the pudding stone, followed along the strike, the lithological character varies. This I have had many opportunities of observing.

(To be Continued.)

The Bennett Amalgamator.

On various occasions the MINING AND SCIENTIFIC PRESS has devoted some attention to the placer machine and amalgamator invented by E. S. Bennett, an experienced miner and machinist of Denver, Colo. In the issue of December 14th, 1895, appeared an illustrated description of the machine as produced by Mr. Bennett at that time. Since then experiments and practical tests have been made, followed by such improvements in the amalgamator's mechanism as those tests showed were advantageous. As a result it is now considered that the machine has been perfected to such a degree that it will practically and economically save the particles of fine flour gold, which by the ordinary methods of hydraulic mining are admitted to be lost. The perfected machine has been evolved from the patient labors and experiments of the inventor covering a period of twenty years.

One of the first machines was seen by Professor Silliman of Yale College, who on March 1st, 1880, wrote Mr. Bennett as follows:

"I contemplate with great satisfaction this invention of yours, which appears destined by its remarkable success to develop anew the 'Age of Gold.' From what I know of the dormant resources of the country, in placers now idle for want of just such means of treating the sands, I shall not be surprised to see the annual product of gold gradually and rather rapidly rise until it meets fully the output of the early historic years of California and Australia. It is perhaps not too much to say that, in my opinion, your machine stands in relation to the ungarnered crop of gold in the auriferous sands as the cotton gin of Whitney stood in 1800 to the then almost valueless crop of cotton."

The original machine was on wheels hauled by two horses, furnished water by a small engine and pump, the dirt being supplied by horses and scrapers. It did good work in Summit county, Colo., and on the Arkansas river near Buena Vista. There the sand left in the sluice boxes used readily to sell for $10 per ton; but local chronicles state that the sand left after the Bennett amalgamator had extracted the gold was considered worthless.

The next machine was set up in Newland's gulch, about twenty-five miles from Denver, where its operations proved the success of the principles on which the machine was constructed, as it saved the particles of gold which could not be saved in panning; but, owing to the imperfect method of handling the gravel and other unfavorable conditions, the work was not wholly satisfactory. In the new machine, as it stands to-day, whatever minor defects that existed in the old have been corrected. It is the embodiment of a scientific idea mechanically demonstrated.

For ordinary placer mining in gravel beds, on bars, in gulches, or on side-hills, the amalgamator proper is mounted upon a steel-bodied car, and requires a power plant for operating. An electrically-operated shovel gathers the sand and gravel, feeding it into the amalgamator, the waste from which is deposited in winrows on the cleaned up bedrock to one side.

For river-bed or lake-bed mining the same class of machines is mounted upon a steel barge. In this case an electrically operated dredge conveys the sand and other material containing gold particles from the banks, bars and beds under water.

The amalgamator, which is interesting in mechanism though not complicated, consists of a main tank, cylindrical grate and sieve, tailing tank, feed-water pipes, jet nozzles, agitator and amalgam plates. The main tank is 27 feet long, 13 feet wide and 60 inches deep. The bottom has two parallel V-shaped depressions which pass from end to end. The bottom surface has a slant or fall of 1 inch to the foot. One end of the tank stands vertically and the other outward at an angle of 45°. The tank is lined with silver-plated and corrugated amalgam plates in such a manner as to form a series of steps or riffles on side and end surfaces from top to bottom. The steps formed by the corrugations have an inward inclination of 15°, thus forming receptacles or pockets for mercury in bulk. The V-shaped valleys or depressions in the bottom likewise are amalgam-plated and catch the overflow of mercury from the corrugated surfaces above. The cylindrical grate, 9 feet in diameter, revolves at the front end of the tank with one-fourth of it submerged therein. The inner surface of this cylinder is provided with a double screw-like conveyor. The material is fed at one end of the cylinder and the coarse gravel and rocks are carried by the revolving screw-like surface to the opposite end, where they are discharged. The finer material, containing the pay dirt, passes through the inner or coarse cylindrical grate into the space between that and the rim. The outside or rim of the cylinder forms a still finer screen, through which the still finer materials pass, the refuse gravel being carried out by the same kind of screw-like conveyors as those fixed to the interior of the coarse grate. The cylinder revolves about seven times per minute, its load of gravel and sand always being submerged in the tank of water whose surface is described above. The material which finds its way through the two cylindrical screens contains, as a matter of course, all the free gold, both coarse and fine. In its course thus

THE BENNETT AMALGAMATOR.

far the materials have become thoroughly scoured and they are submitted to still more violent agitation in the tank by the action of the water, which is given an advancing spiral motion from a point beneath the cylinder to the tailing tank by a system of jets. The water thus used is forced into the machine at high pressure through the jet nozzles in the bottom of the tank. The heaviest gold particles soon gravitate to the mercury-coated valleys in the bottom of the tank; the lighter ones may be caught on the corrugated surface. The lightest particles which are held in suspension in the water cannot escape contact with the side or end plates and are as surely caught as though they possessed greater gravity. By this device, which cannot be more minutely described in this article, tests have been made whereby have been saved not only the coarse gold but the infinitesimally fine particles which by ordinary hydraulic methods are lost, but which no doubt constitute 90 per cent of the value of the world's placers, taken as a whole.

In the absence of a supply of water by gravity steam pumps are used to convey water to the machine. In some localities artesian wells can be obtained, while in others a sufficient supply of water can be developed from the underflow of rivers, or pumped from lakes or large wells, since the plant is arranged to use the water over and over, if necessary. It is demonstrated by actual work in the field that by this machine the gravel can be handled with forty gallons of water per cubic foot of material, as against 1000 gallons required by the ordinary hydraulic method. The cost of handling gravel with these plants is from 2 to 3 cents per cubic yard.

The smallest standard size plant has a capacity of 2500 cubic yards per twenty-four hours, and includes a 200 H. P. engine and boiler, a 100 H. P. dynamo and five electric motors, and, complete, costs $45,000.

The shovels are so constructed as to dump the material into the hopper on the rear platform, thus obviating the necessity of a double track. Leveling devices enable the operators to maintain the body of the car in a level position. They can be raised to any desired height above the track and a new track laid. These devices also permit the machine to pass over hummocks too hard to dig through. They are also equipped with a device for creating lateral motion, by which they may be shifted from one track to another. They are of the dipper type, the bottom opening and closing automatically at proper points, thus doing away with the need of a man with rope connection to open the dipper. Chains have been dispensed with and crucible steel wire rope, 6 inches wide, substituted. The structure is almost entirely of steel, and so framed and jointed as to have the requisite stiffness and solidity to withstand extraordinary usage.

This $45,000 machine is somewhat of an advance from the first one, which cost $20—this simple statement sufficiently illustrating the growth of the original idea. It may be added that it requires but four men to run the entire plant and power may be transmitted over a wire from a point twenty miles away. In brief, the points claimed are perfect saving of the values, maximum capacity with minimum cost of operation, reliability and durability, ability to treat ground where water is scarce, or where dumping facilities are lacking, where gold is so fine as to be ordinarily unprofitable, and to work on such a large scale as will insure profit.

Those familiar with hydraulic mining by the usual method agree on four principal requirements for profitable work, viz: good ground, coarse gold sufficient to insure a profit, even with the loss of the finer particles, an abundance of water at proper elevation to give requisite pressure at nozzles, and dump room for tailings. The absence of any one of these destroys the profitable character of the work. The areas of placer ground having all these requisites have never been great. They are now more limited than ever before. It is beyond question that 95 per cent of the placer ground in the west half of America is lacking in one or more of these essentials. Any machine or process which effects a saving of 90 per cent of the fine gold which was formerly lost, which to a degree overcomes the water question as considered in connection with ordinary hydraulic methods, which makes it possible to work profitably the vast areas hitherto considered unprofitable, will certainly stand Prof. Silliman's comparison of the Bennett amalgamator with the cotton gin. The Bennett amalgamator, as at present constructed, has not been submitted to the tests of time, nor have experiments extended to all conditions, but in localities where it has been operated the result has been a saving of not only the coarse gold, but the minutest particles of flour gold held in suspension in water. The conditions under which tests have been made are believed to have been representative of placer grounds generally. There is no apparent reason why the practical demonstrations thus far made cannot be carried forward to the point of making profitable those immense areas of gold-bearing gravel where hitherto all attempts to work them have resulted in loss and despair.

The Bennett amalgamator's construction and work involve no new principles, but afford a scientific demonstration of well known laws in hydraulics and gravity.

W. A. SCOTT.

Denver, Colo., Jan. 10th, '98.

English Investments in American Mines.

TO THE EDITOR:—I am much amused at the recent communications in your journal concerning brokers, foreign syndicates and this sort. To any one conversant with this business, none of the parties to the discussion seem to know anything of the subject—not even the English correspondent. The latter speaks of his syndicate being willing to give $500,000 for a mine, but the wicked owners held out for $750,000, on which he reads them a pretty lecture, well-deserved if there was such a property, or if he had a real syndicate behind him. He speaks in good faith evidently, but he is near enough home to know better. There are no "set" syndicates in London wanting mines to invest in; there is not a syndicate in all England with $750,000 of its own money to put into a mine anywhere—above all, one in the United States. Rich men will not be bothered with a mine at a distance, but they will sometimes pretend they want such a property, and if they do, it is not to keep but to float on the market. These companies are frequently quoted as being after this and that; we admit they may be, but they never purchase, but only get bonds and sell to the general public.

So when your English correspondent or others of his ilk in this country speak of their Eastern or foreign backers with millions to put into mines, they make those within the pale, smile. * * * * M

San Francisco, Jan. 5th, '98.

Selection, Handling and Care of Belts.

By CHARLES H. GARLICK.

Nearly every engineer has one or more belts under his care, and from the condition many of them are in it would seem that a word of advice as to their selection and care would not be amiss.

If when in need of a belt the engineer would, instead of simply ordering a certain number of feet of a certain width and thickness, try the experiment of personally selecting the same for the work which he wishes to have the belt do, and then use the same care in placing the belt in use that he does in starting any other piece of new work or new machine much better results would be obtained than is usually the case. There are many, very many rules and formulas for ascertaining the width of belt necessary for transmitting a certain amount of power. No two of these rules agree, because there are so many conditions that enter into the problem that no hard and fast rule can be used.

From the writer's experience he prefers to use the following formula, which in ordinary cases will be found nearly correct:

$$W = \frac{H.\ P. \times 5500}{Velocity \times contact\ in\ feet.}$$

This is single thickness. For double thickness belts:

$$W = \frac{H.\ P. \times 3600}{Velocity \times contact\ in\ feet.}$$

Or the width of the belt can be found by multiplying H. P. to be transmitted by 3600 and dividing the product by the number of feet of the belt that will pass over the pulley per minute multiplied by the number of feet of belt in contact with the driving pulley. A very good "rule of thumb" for single belts is: Belting 1 inch wide having a velocity of 600 feet per minute will transmit one H. P.

It should be borne in mind, however, that the width of the belt necessary to transmit a certain H. P. depends on several conditions, one of which is the tension of the belt. When a belt is too tight there is a constant waste in journal friction, and when too loose a great loss in efficiency from "slip." A belt should be procured that will deliver the power required in a fairly slack condition.

Between a slow speed and a wide belt and high speed and a narrow belt, choose high speed and narrow belt wherever practicable, in designing for the transmission of power. A velocity of belt up to a mile a minute is practicable and advantageous.

In taking lengths for belts where it is not convenient to measure with a tape-line the length required, this rule will be found of service: Add the diameters of the two pulleys together, divide the result by 2 and multiply the quotient by 3½; add the product to twice the distance between the centers of shafting and you have the length required, very nearly.

In buying be sure that the leather is oak tanned, has a smooth, polished surface and a fine fiber. It is a good idea to have the belt unrolled and examine it to see that laps are thoroughly made and fastened. Note whether the belt is of the same uniform thickness throughout its entire length, also that the belt is pliable and not harsh and brittle. Note if possible whether the hides which make up the belts are of uniform thickness or whether the thickness of belt is obtained by splitting the hides, and if the latter is the case reject it.

As to whether you purchase single or double belts it may be said that single belts can be used successfully up to 12 or 14 inches in width, but where more power is required than a belt of this width will transmit under the conditions that exist in your plant, belts of double thickness should be used. With single belts care should be taken to have them of ample width so that there need be no necessity of having them tight. Double belts should be used when a great strain is to be put on the leather, or for slow speed, or when a belt is to be run at one-fourth turn, belts which you are called upon to shift frequently, or which are to run on vertical shafts, should be double.

As to the respective value of rubber or leather belts: Rubber belts do not cost as much as leather, nor do they, under favorable conditions, last as long. They cannot be used in places where the belt rubs, nor where it becomes necessary to shift often; neither can they, as a rule, be run successfully as cross belts. They should not be used where oil is likely to drop on them, nor where they will freeze. They usually last longer than leather belts in damp localities. Rubber belts will adhere to pulleys better than leather. When a rubber belt commences to wear out it is almost impossible to do anything to repair it. Having purchased a new leather belt, it should, if time will permit, be stretched before being placed in work. This can be done in a variety of ways that will present themselves to the engineer, depending on the width and length of belt and the time at the engineer's disposal. One way is to stretch it over two pulleys placed some distance apart and attach weights to either end of the belt. During the stretching period a little oil should be applied to the leather.

Belting for electric lighting machinery must have some characteristics all its own. For ordinary machines a positive steady motion is not absolutely necessary, but with an electric plant it is different. It is necessary for the belt to be endless and of a uniform thickness. Even so small a thing as uneven laps will cause a slight but constant jumping or flickering of lamps. With most dynamos as built to-day provision is made for the purpose of taking up any stretch that may occur in a properly constructed, designed and well-stretched belt. Yet should it become necessary to shorten one of these belts it may be done by using clamps. Care should be taken and the laps made as long as possible, and sufficient time given the work before removing the clamps.

While endless belts are to be preferred for almost all work, yet in many places the time, care and experience required to join them is such that recourse is had to the more convenient method of lacing or fastening with clamps or hooks, and of all the different methods the writer has been more successful with and prefers lacing. But even such a simple piece of work as that of joining a belt by means of a lace—a narrow strip of rawhide—is sometimes done in a manner as to very materially reduce the life of the belt, and very seldom is sufficient time or care given to this work. The ends of the belts should be cut exactly square, using an ordinary tri-square for this purpose. Punch the holes exactly opposite each other in the two ends of the belt to be joined. It is best to use an oval punch for this purpose, the longest diameter of holes being parallel with the belt. Two rows of holes should be made in each end of the belt, the same being staggered. The edges of holes should all be at least ¾-inches from the end or side of belt; be sure and keep the belt square and lace both ends equally tight. The laces should not be crossed on the side that run next to the pulley, but on that side laces should run parallel with the belt. Fig. 1 shows the inside of the lacing, or the side that

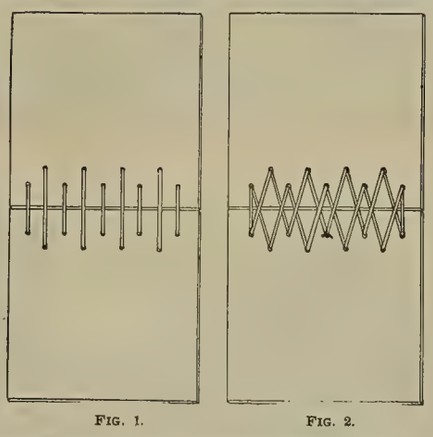

FIG. 1. FIG. 2.

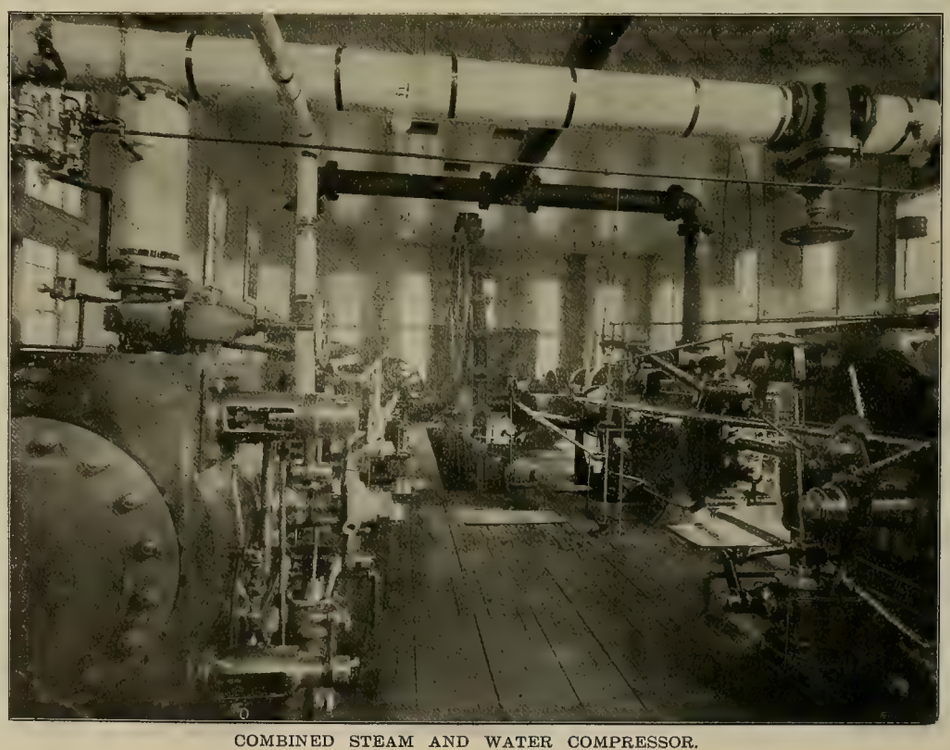
should run next to the pulleys, and Fig. 2 shows the outside of the lacing, the side that is not in contact with the pulley.

In placing the belt on pulley, put it on so that pulley in slipping will run with, and not against splice or joint. While authorities differ as to which side of the belt should be placed next to the pulley, the writer's experience has been that the best results are obtained when the grain side is placed next to the pulley. Experience has proven that it will drive more than when the flesh side is in contact with the pulley, and that the belt will last longer.



If the belt is to be crossed, do not put it on in such a manner that at the places of passing joints or laps will meet and be turned up and ruined in a short time.

How to place a belt on a pulley is one of the little things one can become an adept in only by practice. If the belt is a heavy one and the pulley runs at a high speed, it is best to slow down the machine, then place the belt on the loose pulley or the pulley at rest. Secure a firm footing and with the right hand slowly work the belt up to top of pulley, when a quick jerk down or up, according to the direction the pulley is running, will throw the belt on. When the belt is heavy, or the operator lacks experience, it is best to shut off the power, place the belt on pulley as far as possible, then take a small leather belt, or even a rope, double it, slip one end through the arms of the pulley and around the belt and rim of the pulley ane the other end through the loop formed by the doubld of the small belt or rope; then stand on the floor on the opposite side and draw on the small belt or rope, when the belt will be drawn to the rim of the pulley. When the machine is placed in motion, the belt may be slipped on without any trouble; then by letting go of the small belt or rope when the belt is on the pulley, the noose will be undone and the small belt will be free.

If the belt does not stay on the pulley do not erect guards to keep it on, as they are an eyesore, and soon wear the belt out. Besides, the guards simply cure an effect while the cause remains. The cause may be that the pulley is not in line, or that the belt is not joined squarely, or one side is stretched more than the other. Sometimes a belt running at high speed, transmitting scarcely any power, will wave from one side of the pulley to the other, and if a load is not thrown off will eventually come off. In places where it was not convenient to either put in pulleys of larger diameter, or even wider belts, and where the use of resin, oil and other adhesive matter would not cause the belt to adhere to the pulley, the difficulty has been overcome by running a narrow belt drawn tightly, with ends laced, over the main belt. In one place where occurred a continual slipping of a 10-inch belt the writer took an old 2-inch belt, placed it upon the 10 inch, and the two belts carried the load for years without trouble.

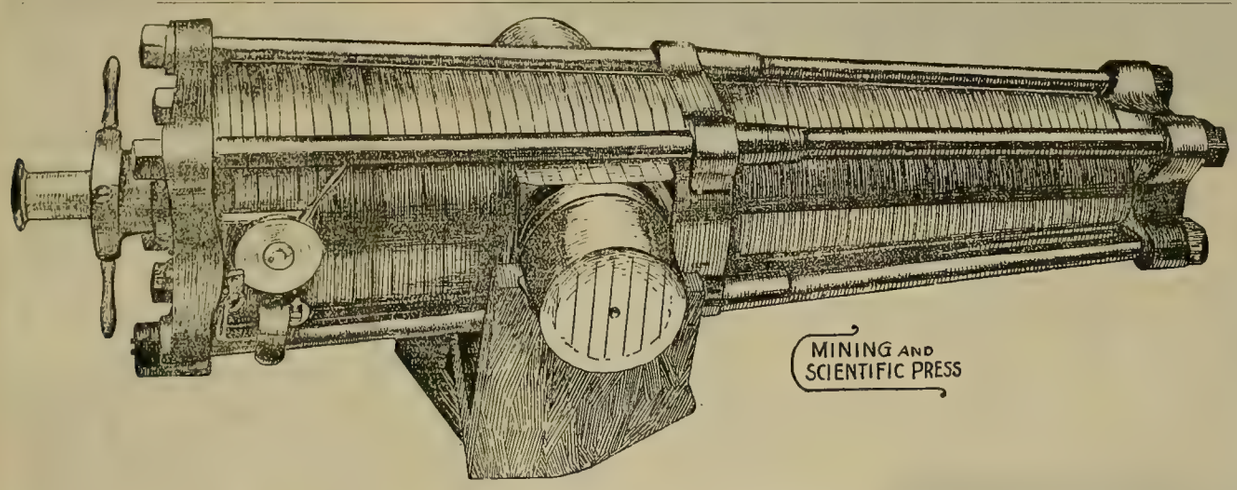
A Combined Steam and Water Compressor.

The cut below illustrates a recent installation at the Alaska-Treadwell mine, Douglass Island, Alaska. This consists of a Duplex-Reidler Compressor, with air cylinders 24 inches in diameter by 36-inch stroke, driven by a horizontal, cross-compound condensing engine, with steam cylinders 24x38x36 inch stroke. The steam cylinders are placed behind the air cylinders, the piston rods being connected by threaded couplings in halves, admitting of disconnecting when operating by water power. The compressor has a capacity when running at seventy-five revolutions of delivering 2800 cubic feet of free air per minute. The wheel is 22 feet in diameter, direct con-

COMBINED STEAM AND WATER COMPRESSOR.

nected to the shaft of the compressors, serving the purpose of a fly-wheel as well as prime mover. It weighs a little upwards of 25,000 pounds, and running under a head of 480 feet at a speed of seventy-five revolutions, develops upwards of 500 H. P. An hydraulic speed regulator is attached to the wheel, which controls its movements so that a uniform air pressure is maintained on the receiver at all times. This is believed by the builders to be the largest tangential wheel ever constructed, and shows the remarkable facility with which Pelton wheels can be adapted to unusual and extraordinary conditions. In a case like this the transmission machinery to carry such an amount of power would involve a heavy outlay, as well as constant expense in maintenance, besides material loss in power. A direct connection of water wheel to machinery to be operated without intermediate gearing is, therefore, obviously of great advantage whenever possible. The superintendent of the above company reports this plant as working very smoothly and with a high degree of efficiency, saving fully 20 per cent in power over the usual means of transmission by rope drive. The compressor and engines were furnished by Fraser & Chalmers, of Chicago, and the wheel by the Pelton Water Wheel Company of San Francisco.

Indestructible Big Cannon.



Experts of the United States Ordnance Department have under consideration a new gun that is expected to revolutionize the art of cannon making. The inventor, Edwin T. Blood of Chicago, says:

"The gun is constructed in sections of moderate weight, each section being made, not of cast, but of rolled steel disks, carbonized to the desired degree. Each section is ring-shaped and of a size to match the central steel tube, which is forced into place through these rings by hydraulic pressure. The sections are held immovably together by means of steel rods which are bolted on crossheads at each end. The largest and heaviest part of the gun is the central tube of thin steel containing the bore. The simplicity and ingenuity of this arrangement of steel tube fitting into steel rings of tapering size will be seen at once. When the inner tube expands with the heat it is only clasped the closer in the embrace of the steel rings which take up the heat. When the gun is cold the rings are tightened by the inner barrel being pressed into the rings by hydraulic force, the indicator on the hydraulic pump used for this purpose showing the degree of force applied. By this means every square inch on the surface of the tapering inner barrel is subjected to exactly the same pressure. Hence, the initial tension imparted to the outer steel disks is regulated and distributed throughout the body of the gun with exact nicety, and can be relaxed at will, relieving the gun from the strain of a high tension when desired.

"It is a well authenticated fact, capable of demonstration in many ways, that vibrations produce changes in the molecular construction of metal, causing granulation and crystalization. In this cannon the seams between the disks forming the body of it check the vibrations produced by the explosion of powder on the same principle that a fracture in a bell checks its vibrations. Hence these disks will not crystallize, and being of the finest fiber under equal tension, they guarantee great durability.

"In case the inner barrel is powder-burned or its rifling impaired, it can be quickly removed and a new one supplied, making practically a new gun.

"Another important feature is, it can be built in a fraction of the time now required to build cannon by any other known method. By this system it is practicable to build a gun of 22-inch caliber in a much shorter time than it is possible to build a gun of 10-inch caliber by the present methods."

CANNON MADE UP OF SMALL PIECES.

Geology of the Yukon.*

NUMBER I.

A voluminous report regarding Alaska is the publication entitled "Geology of the Yukon Gold District of Alaska" by Josiah Edward Spurr, of the United States Geological Survey. The book contains all that the geological survey has been able to obtain regarding Alaska, and is complete in its minute details and description of the various rocks and geological formations of interest to the expert. Mr. Spurr and party went from Juneau up the Lynn canal, across the Chilkoot pass to Lake Lindemann, and thence by boat to the gold mining district. They went down the Yukon to Nulato, thence to St. Michaels and home by Unalaska. H. B. Goodrich, accompanied Mr. Spurr and he makes a specialty of some features of the report.

The report contains a long description on the movement of the earth's crust, describing the migration of material surface through atmospheric agencies. It says among these processes, however, regional movements producing the uplift or depression of great areas and the folding or faulting of the superficial rocks are primarily important, since it is largely upon these that the minor adjustments depend. The features of general importance in the history of rock formations along the gold belt in Alaska are, so far as is imperfectly known, as follows:

The notes which have been made upon the geology of the Yukon gold belt indicates that the geological column in this region begins with the fundamental granite which overlays all thick quartzites; that this quartzite series is overlain by imbedded sedimentary rocks which were regional sandstone, limestone and shales. All these rocks have been subjected to regional pressure, and all have been rendered schistose together. The effects of the shearing, however, are much more marked in the sedimentary rocks than in the more massive granite. At about the same time as the development of the schistose, probably near the beginning of this process, dikes were intruded into the sedimentary rocks and quartz veins were formed. The series of igneous injections thus begun continued for a long period of geological time, and did not cease until after the end of the movements in the rocks which gave rise to the schistose structure. The first dikes which were afterward rendered schistose by the subsequent regional movements were granitic or dioritic, while later dikes, as a rule, were more basic and more acid, and the final injunctions, so far as observed, were of extremely acid dikes, associated with the quartz veins. Previous to the intrusion of these very latest dikes, but at a period when the development of schistosity was nearly at an end, there occurred vast outpourings of basaltic and dibasic lava over large areas, and these igneous rocks were tuffs and impure sandstone largely derived from them, and constituted a very thick series. This volcanic activity seems to have been very nearly to the end of the period of disturbance which had been manifested by the shearing, folding and injunctions of igenous material. Subsequent to the outpouring of the lavas, however, dikes were still intruded, as is proved by the occurrence of these bodies cutting the effusive rocks. But these dikes seem to belong generally to the extreme types which characterize the close of the series of intrusions.

The quartz veins which occur in the district seem to be closely connected with the dikes, and were probably formed at successive periods corresponding with the repeated injunctions of igenous material. Therefore, the oldest veins have been sheared, together with the oldest dikes and the inclosing rocks, and have been followed and stretched so that they are characteristically narrow and nonpersistent, and difficult to follow. The latest veins, however, which accompanied the latest granitic and aplitic intrusions, are, like these dikes, unsheared and practically unfollowed, and therefore may be not placed wide and persistent. All these veins seem to carry gold in varying amounts, and they probably are the chief source of the gold now being taken from placer diggings.

Following the period of the great lava eruptions, limestone and other sediments were laid down, succeeded by more shaly and conglomerate beds. These sediments are largely marine, but have occasional leaf beds, indicating fresh water conditions, and scattered fossils show a range probably from Devonian to Eretraceous. Above these sediments was laid down a very thick series of fresh-water beds, which are largely conglomerate containing abundant plant remains and seams of lignitic coal. This series, on the evidence of its flora, has been referred to the Eocene. Subsequent to the formation of this conglomeratic series, violent movements took place in the earth's crust. Great folds were formed, among them that which has been named the Yukon gænticline, which has a northwest and southeast trend. The beds were upturned and the development of the Alaska of the present day began. By erosion of the Yukon gænticline the different formations were exposed in northwest and southeast trend zones. This is especially the case in the lower schistose gold-bearing formations.

(*To be Continued.*)

*Condensed from advance sheets of "Geology of the Yukon Gold Dist. of Alaska," by Josiah Edward Spurr, of the U. S. Geo. Survey.

Most Convincing Proof.

To the Editor:—Your valuable paper of November 20th, 1897, contains an article headet "The Divining Rod Finds a Champion." It appears to me, that you are a sceptic, therefore i wish to convince you, that both mettals, gold and silver, as well as water can be found with help of a divining rod. I beg you therefore to please give me an opportunity to proovve to you, that i, with the use of a divining rod, witch is really a magnet, with certainty can locate both mettals at distinces up to ten miles or (of my own invention and make).

At this distance i locate blind veins or cropping out, i can give the acurate depth below the surface and with of the mineral bearing part. i can follow anny vein from beginning to end, find burried money. I blame no person for being sceptical, and would not believe the above could be accomplished, if i could not doo it myself. i am 74 years of age, and not strong enough to use my invention for profit, there being a great many fakirs here in california, causing poeple to become sceptics.

Yours truly, A. B A HN.

San Diego, Cal., Jany. 18th, 1898.

Jan. 31st Will Be "Miners' Day."

J. F. Halloran, 330 Market St., City: On Monday, Jan. 31st, at the Golden Jubilee Mining Exposition will be a day known as "Miners' Day," when all miners of the State of California are expected to assemble in the Pavilion and enjoy themselves.

The Southern Pacific Railroad has kindly consented to extend the cut rates until the 4th of February, so as to enable all miners to participate in this celebration at the Pavilion and be enabled to return home on the excursion rates of tickets.

It is sincerely hoped that a large concourse of miners, their wives, mothers, sisters, daughters and sweethearts will assemble on that day and make of it a grand success, which it richly deserves. Very truly yours, Julian Sonntag,

Sec'y California State Miners' Association.

Geographical Society of the Pacific.

At the annual election held Jan. 18th in the rooms of this Society, in the Merchants' Exchange Building, California St., the following members were elected to serve during the current year: Directors—Prof. George Davidson, Charles L. Taylor, John Dolbeer, Edgar J. Bowen, Louis L. Nelson, John Partridge, H. Durbrow. Councillors—Ralph C. Harrison, Mark Sheldon, William Hood, Charles Goodall, James F. Houghton, Gustave Niebaum, Senator George C. Perkins, Henry Lund, Irving M. Scott, Jeremiah Lynch, Adolph Sutro, F. S. Cook.

Electrical Progress.

Electric Locomotive on the Hoboken Shore Road.

The use of electricity for switching purposes on a steam railroad, in place of the noisy drill engine, takes another step forward, this time on the Hoboken Shore Road, Hoboken, New Jersey.

The new electric locomotive was put into regular service on the 4th inst., hauling trains of loaded and empty freight cars between the docks and the Erie track. The difference in its operation from that of the common drill engine is immediately noticeable. The electric locomotive responds instantaneously to the movement of the controller handle and starts without jerk or noise, tightening up the couplings uniformly or coupling the cars together so gently that no blow is perceptible. The locomotive was constructed in the shops of the General Electric Company, at Schenectady, New York, and somewhat resembles in appearance several other electric locomotives built by them. It is mounted on two four-wheel trucks, each axle carrying a General Electric 2000 motor, giving the locomotive a total of 540 rated H. P. The weight on the drivers is 57,200 pounds; the draw-bar pull is 10,000 pounds. The locomotive is driven through a single reduction gear of a very low ratio. The speed is correspondingly low, and is rated at eight miles an hour when hauling a heavy load.

At each end of the locomotive is an automatic coupler, and a small railed platform for the brakeman in charge of the trolley pole. The cab is of iron and resembles a double steam locomotive cab, with a sloping tender shield at each end. Drop windows are set around the four sides of the cab, affording an unobstructed view in all directions to the motorman. On each shield is a headlight; in addition one shield carries a bell, the other a chime whistle. Beneath one of the shields are four packed card resistances, two sand boxes, the compressed air tank and the equalizing air tank; beneath the other, eight resistances, two sand boxes and the engineer's tool box. At one end of the cab is placed a controller of the series parallel type known as the L-2. It contains a magnetic blow-out, and is arranged to operate the motors either four in series, or each two in series-multiple. Besides the controller is the air-brake handle and the two valves of the sanding arrangement, by means of which the sand is blown by the compressed air under the wheels.

In front of the motorman is an air-brake gauge, and above it an ammeter reading to 500 amperes. Fastened to the roof of the cab is an L automatic circuit breaker set at 500 amperes. On the other side of the controller, from the motorman, is an M circuit breaker and an automatic governor switch for the air pump placed at the other end of the cab. This is a single cylinder pump driven by a 3 H. P. iron-clad bipolar slow-speed motor. The operation of this air pump is automatic. When the air in the tanks is at normal pressure the governor switch is opened. Blowing the whistle, applying the brakes, or using the sander, causes the pressure to fall. This closes the switch automatically and starts the motor and pump.

The overhead wire is 00 suspended from wires strung between octagonal cedar poles, except at two or three points, where bracket construction is used. Where the locomotive turns in from Hudson avenue to the river walk, a peculiar condition has caused a special method of bracket construction. It was necessary for the overhead line to be so set as not to infringe upon the limit of the next property. Thus, at this point, the overhead line is suspended from two bracket arms, one 6 feet and the other 18 feet long.

GENERAL ELECTRIC COMPANY'S LOCOMOTIVE, HOBOKEN SHORE ROAD, HOBOKEN, NEW JERSEY.

INTERIOR OF CAB, GENERAL ELECTRIC COMPANY'S LOCOMOTIVE.

According to the *Electrical Review*, T. A. Edison is looking for more worlds to conquer. In its issue of the 5th inst. our New York contemporary says: "Edison, satisfied with the success of his iron mining, is now ready to enter the field of gold placer mining. Contracts have been in his desk for six months awaiting his signature to begin this work. It will be entered upon where the low-grade gold deposits are vast and extensive, as the construction of the mills is very expensive. Many discarded placer mines will undoubtedly become very valuable because of Edison's new process."

Mechanical Progress.

New Boiler Setting.

A newly invented form of boiler setting has for its object to prevent the crumbling or crushing of the setting from undue expansion. It is applied to that class of boiler settings comprising a main or inner wall and an outer wall, with an air space between these walls, the boiler being provided with the usual boiler lugs, which rest upon suitable rollers on a ledge in the inner wall; in the improvement special pains is taken to so set the boiler that not a particle of brick work is in contact therewith, so that the expansion of the boiler is perfectly free and unobstructed. The air space extends between the walls at the sides and at the back, and it also extends from the bottom up through the top of the setting and opens into the outside air, wire netting being provided across this space at the top so as to prevent foreign matter from dropping down into the same and clogging the space. Openings extend through the outer wall at opposite sides of the setting and lead into the air space, so that communication is afforded between the outside air and this space, whereby the latter is kept supplied with fresh, cool air; and for the same purposes openings are provided in the back of the outer wall. The air space extends through the main and outer walls at the front of the setting and is closed by the front plate, this space being provided with a jog at the front in order to bring the space within the limits covered by the plate. Openings are provided in the front of the outer wall and extend into the air space, so that fresh air is also supplied to the space at the front of the furnace.

Thus it will readily be understood that this air space completely encompasses the main wall, and that the space throughout its entire length opens into the outer air at the top, and that fresh, cool air is constantly supplied to said space. Heretofore the air spaces have been provided around the main walls but such spaces have been closed entirely at the top, except that one or more vents have been provided through which the air which has become heated is discharged. In such constructions but very little benefit is obtained from the air spaces, whereas in this improvement fresh, cool air is continually surrounding the main walls, the air, as fast as it is warmed, ascending up through the top of the spaces.

The following process, invented by Mr. Rubbineck, for metallizing wood, is thus described by *Les Mondes:* "The wood is first immersed for three or four days, according to its permeability, in a caustic alkaline lye (calcareous soda) at a temperature from 75 degrees to 90 degrees. From thence it passes immediately into a bath of hyposulphite of calcium, to which is added, after 24 or 36 hours, a concentrated solution of sulphur in caustic potash. The duration of the bath is about 48 hours, and its temperature is from 35 to 50 degrees. Finally the wood is immersed for 30 or 50 hours in a hot solution (35 degrees to 50 degrees) of acetate of lead. The process, as may be seen, is a long one, but the results are surprising. The wood thus prepared, after having undergone a proper drying at a moderate temperature, acquires under a burnisher of hard wood a polished surface, and assumes a very brilliant metallic lustre. The lustre is still further increased if the surface of the wood be first rubbed with a piece of lead, tin, or zinc, and be afterwards polished with a glass or porcelain burnisher. The wood thus assumes the appearance of a true metallic mirror, and is very solid and resistant."

Thomas Storer of Glasgow proposes a new process for the treatment of New Caledonian ores. After being finely ground, the ore is treated in a closed vessel with a solution of ferric chloride at a temperature of 370 degrees Fahrenheit for five to eight hours. The solution of nickel chloride is then run off, any traces of ferrous salt thrown down with chalk, and the nickel recovered in any suitable way. The insoluble ferric oxide is washed, and forms a red pigment. Ores containing 5 to 8 per cent of nickel require about 1700 lbs. of ferric chloride to the ton.

The following process of making blasting and mining fuses has just been patented: A core of nitrocellulose is impregnated with a solution of nitrate and chlorate of potassium containing either prussiate of potash, picrate of potassium or carbonate of potassium, in addition. It is then dried for use. The core may be used direct or may be insulated. As a modification a core is formed of cellulose boiled in a solution of nitrate of potassium, chlorate of potassium and prussiate of potassium, and after being dried it is ready for use.

A plan for constructing an underground pipe, that is not to be subjected to a great pressure, has been employed in France with satisfactory results. A trench is dug and the bottom levelled with cement mortar; an inflated rubber tube covered with canvas is then laid in and cement is poured around and over it. The trench is then filled in and the tube deflated and withdrawn. It is said that 6-inch pipes have been made of hydraulic lime and sand at a cost of 22 cents per yard.

An inventor is endeavoring to perfect a phonographic watch. If he is successful the world will soon see a watch which, by touching a spring, will whisper the time in one's ear.

Scientific Progress.

Liquid Air Intensely Cold.

It is thought that the question of future economy in motive power may be intimately associated with the important discovery of liquefied air. There are so many uses to which it can be put that scientists hardly know where its usefulness will end if it can be produced at a low rate of cost in commercial quantities. Among other advantages, it is claimed that it can be used for illuminating purposes by mixing its escaping gases with atmospheric air in certain definite proportions. Its use in physical experiments has been a most important one in developing the action of intense cold. A most curious phenomenon is shown in the condition of meats at the extremely low temperature derived from the evaporation of liquid air. Mutton becomes so extremely hard that it rings like a piece of porcelain when struck with an iron rod, and can be crushed into a fine dry powder with a hammer, muscle, fat and bone being all mingled together, and as dry as sand.

If a test tube 1½ inches in diameter, having a couple of pounds of mercury in the bottom, is immersed in liquid air, the mercury will be frozen solid in a few seconds, and may be hammered out and manipulated like lead. An alcohol thermometer of large size will be frozen instantly upon being immersed in it, and a tablespoonful poured on about a liquid ounce of whiskey will freeze it at once in flat scales, giving the whole the appearance of cyanide of potassium. It may be emptied out on a table, and will remain frozen in that condition for fully five minutes. A teacupful of liquid air poured on top of a tank of cold water goes into a spheroidal state instantly, in globules of about half the size of ordinary marbles, which fly around on the surface, leaving a trail of white vapor behind them. If any of the liquid be poured on silk, linen or cotton, it will be charred and destroyed just as if it had been put in an oven and browned, though it will make no change in the color.

Professor Linde of Munich has discovered a method of liquifying air which is considered one of the most ingenious methods recently known. It is to be sold by the quart in iron bottles. A quart bottle will do the work of a ten-pound piece of ice. A considerable reduction in cost will be necessary, however, before this commodity will take the place of ice in our refrigerators, and even if it were cheaper there seems to be no way of moderating the cold.

Instead of chilling the air moderately in an ice box, it freezes everything solid; but this will doubtless be overcome in time. In handling the bottles the fingers will be instantly frozen if they are not covered with insulating gloves of rubber. In a few years, it is claimed, the methods may be so perfected that liquid air will be used entirely for refrigeration instead of ice.

THE authorities controlling the electric lighting plant at Geneva are starting a calcium carbide works in order to utilize the idle hours of their plant. The dynamos are driven by water power, of which there is an abundance. Special attention is being paid to the use of good material and the production of the best results. The coke contains but 5 per cent of ash. The lime is very pure, containing 99 to 99.5 per cent of calcium oxide. Each furnace will take 500 H. P. (6000 amperes at 57 volts). They are probably the largest used for the manufacture of calcium carbide. The furnace is a large cylindrical crucible 59 inches in diameter and 32 inches high. The electrode is made of compressed carbon in six pieces, each 60 inches long, 5 2 by 9.2 inches in section. The weight of the six carbons is over 858 lbs., and the total section is 287 square inches. In order to reduce labor charges as much as possible, the pulverizing of the coke, mixing the lime and carbon, and other operations are performed mechanically. From the time the crude material is received until it comes from the furnace but one man's labor is required, most of the operations being automatic.

Total Eclipse of the Sun.

To-day during the space of 120 seconds the sun's light will be extinguished at noon. Mr. Charles Burckhalter, F. R. A. S., and Prof. Campbell of the Lick Observatory represent California in the observers in India. Prof. Burckhalter took a number of instruments especially devised for photographing all parts of the solar corona simultaneously during a total eclipse of the sun. Its duration will be two minutes, the time of occurrence 1 P. M. The eclipse will be total along a tract of land eighty miles in width, across India in a northeast direction from Bombay to Darjeeling.

To view this eclipse the Indian Government and several astronomical societies have arranged to occupy all convenient spots along the line of totality, wherever the railroad system intersects this line. A total eclipse of the sun is a great spectacle. As the dark shadow of the moon steals over the face of the sun the landscape grows dimmer on the horizon with an ashy paleness. The moon sweeps over the entire sun and enshrouds the earth in a pall of darkness. Some of us have, perhaps, stood on a lofty hill and seen far away the green fields stretching beneath us in a wide expanse, and some great river winding its way over the fields like a silver streak; then suddenly a dark cloud swept past the sun, and the coming shadow cast on the ground rushed on over field and river and mountain. So it is with a total eclipse; but the shadow of the moon travels over the earth with a far more impressive velocity, and the ensuing darkness is far more intense. Just before the moment of totality suddenly round the moon, shooting out into the surrounding darkness, appear tongues of fire, often 100,000 miles in length. Their appearance varies in color at different eclipses—sometimes blood red, sometimes rosy pink, and sometimes all the colors of the rainbow. Then comes the corona. Bright ethereal waves of white surround the sun just outside the lurid red, and stretch into the sky a million miles. Around the outer corona sometimes appear white streamers of light, radiating from different parts of the corona and reaching far into space. At the moment of totality the sky is lit up by stars. When the few moments of totality are over the sun appears, the corona vanishes and the red flames of the sun shrink into the disc of the fiery orb.

Cast Steel and Steel Castings.

"Cast steel" is a term that was introduced to distinguish crucible steel from "blister steel" or "weld steel," at the time crucible steel came into use, and once indicated the highest quality. To-day the term means nothing definite, for Bessemer and open-hearth steels, both basic and acid, now are all "cast steels." The term "cast steel" might, by this time, have passed into history were it not due to the practice of many manufacturers of hardware of truthfully stamping the words on inferior articles, and allowing the unsuspecting public to infer that it is the same metal that their great grandfathers thought so highly of. While the "cast steel" of to-day is very likely to be a brittle and worthless material, a good steel casting is quite the opposite. Good steel castings are not only strong, but tough, and have ductility and malleability not much inferior to rolled structural steel. A round rod turned from a steel casting may be tied in a knot, cold; and, after cutting the felloe of a wheel between the spokes, the latter may be twisted up or bent over the hub without a break. Moreover, steel castings may be forged hot or straightened cold.

It is safe to say that any machine or structural casting that can be made in iron can also be as well, or better, made in a steel casting, and with the result that instead of having a weak and brittle object, we have one that is tough, ductile and of as many degrees of strength that may have been decided on beforehand. Steel castings may be safely and economically used in tension as well as compression, which iron castings cannot. Having discovered the general value, utility and economy of steel castings for important work, it will not do to simply order or specify a "steel casting," or we may find that we had better have stuck to iron castings. There have been many so-called steel castings that would bother any metallurgist to classify with any known or recognized product, beyond the fact that they contained nearly 100 per cent of iron; they have lacked many elements that they should have had, and contained to excess many that they should have lacked. To obtain a good steel casting we must have a good specification, and for ordinary and general purposes the following will give good results: Steel castings should be made of acid open-hearth steel, containing not more than .08 of 1 per cent of phosphorus, nor more than .05 of 1 per cent of sulphur. They shall be carefully and uniformly annealed, and test pieces cut from annealed castings shall have a maximum tensile strength of not less than 60,000 pounds to the square inch, and an elongation after fracture of not less than 20 per cent on an original length of 2 inches. Castings shall be true to drawings, smooth, and clean from blow-holes, sponginess and other defects. For important or special work a more elaborate specification should be made, in which the strength may be increased to 90,000 pounds if desirable, the phosphorus and sulphur lowered, and account taken of manganese and silicon, which are important but not dangerous elements in steel castings. It is the general American, but not European, practice to specify elastic limits for structural materials. If this is done for steel castings, the minimum should be placed at 45 per cent of the maximum strength, as owing to lack of work by rolling or forging it will often fall to this point. Acid open-hearth steel has been specified, as it is according to the best practice of the largest steel founders, and for very good reasons. It requires the best of melting stock, and its composition can be accurately calculated beforehand. When the steel is made it can be held in the furnace for a reasonable length of time without change or deterioration, while molds are being placed or changed, which is not the case with basic steel. Welds on steel casting, or in fact in any form of Bessemer open-hearth steel, should be avoided, as they are unreliable.

LORD KELVIN showed in a recent address that all the oxygen in the atmosphere probably came from the action of sunlight on plants. When the earth was a globe of hot liquid it contained no vegetable fuel, and probably no free oxygen. But as it cooled off plants appeared on its surface, and these began to evolve oxygen through the medium of the sunbeams. Upon the oxygen thus derived we depend upon the maintenance of life by breathing. When we burn coal, or other vegetable fuel, we use up oxygen, and it is to plants again that we owe the restoration of the oxygen thus lost to the air. If they failed to keep up a sufficient supply, the atmosphere would gradually part with its oxygen, and the inhabitants of the earth would gradually disappear in consequence of asphyxiation.

A THOROUGHLY good and practical way of blackening aluminum has until recently been unknown. The following, however, is stated to give very good results: Polish the surface to be blackened with fine emery paper, then spread on it a thin film of olive oil, and heat slowly on a spirit flame. After awhile the oil boils and takes a golden color. Then lay on another coat of oil and heat strongly. The golden color becomes brown and soon darkens to an intense black. Let the article cool, wipe off the oil and let dry.

Coast Industrial Notes.

—Asphalt shipped from Santa Barbara Co., Cal., in 1897 amounted to 583 cars, valued at $150,000.

—The sulphur vein recently discovered on the Peak of Orizaba was sold to an American corporation, says *Two Republics*, for $150,000.

—The ranches and live stock of the Detroit Land and Cattle Co. in New Mexico have been sold to Levy Baldwin of Socorro Co., N. M., for $500,000.

—On the San Francisco & San Joaquin Valley road the work of laying track between Hanford and Bakersfield progresses. The road will be completed into Bakersfield March 15th.

—In the State of Jalisco, Mexico, the falls of Juanacatlan, located fifteen miles from the city of Guadajara, which is now supplied with electric lights from this fall, a great source of power exists. Juanacatlan has been called "the Niagara of Mexico." There the River Lerma, which drains Lake Chapala, with a width of over 200 feet, makes a leap of 60 feet. The cotton mills of Tialpan, a suburb of the City of Mexico, are now being moved to these falls. In the northeastern part of the State of Pueblo a whole river make a leap of 997 feet. Near the station of Rascon, on the Tampico branch of the Mexican Central railroad, is the Abra de Caballos, where another river falls in a series of cascades some 300 feet, and in various parts of Mexico, from the State of Chiapas, in the south, to the northern States, there are similar falls, where valuable powers exist. The conformation of Mexico is favorable for the creation of water powers, as the largest part of the country is an elevated tableland, which acts as a large roof, and on all the slopes where the water falls down to the lowlands there are valuable water powers.

—Pres. Robinson of the Mexican Central R. R. says: "Mexico is now prosperous to an unprecedented degree; in fact, the country could not well stand greater prosperity. The Mexican Central R. R. naturally shares in this prosperity. The gross earnings for the year ending Dec. 31st will show a large increase over the preceding year; the deficit after charges will be slightly reduced from our previous estimate of $700,000. During the past year $1,500,000 has been expended, principally for additional rolling stock, to take care of the great volume of traffic offering the road. Forty-six locomotives have been purchased and are now on the ground. The company is now receiving about 46 cents for its silver dollars. We never speculate in them, as they are sold as soon as we receive them. The prospects for 1898 are very good; they are even better than were the indications a year ago for 1897. We have not yet heard from the Mexican Government relative to a reclassification of tariffs, but we expect to hear from them very soon. Their favorable action, which is expected, will be of material benefit to Mexican railroads."

—Commercial missions must bring large results to nations who take intelligent methods to ascertain the needs of the world's markets and adjust their manufactures to the demands of distant peoples. The associated chambers of commerce of England sent out an expedition which submitted to its promoters matters of interest which may prove to be of the greatest importance to English trade. In order that the United States may enlarge foreign trade, it is of the first importance that our manufacturers should know not only what suits American tastes and prejudices, but what other people like and will have, and how to prepare and deliver such goods. The establishment of a commercial museum in Philadelphia and the projecting of another in San Francisco is the first organized effort of the United States business men to supply needful information and illustration of the world's products and demands. One of the most valuable uses of such museums is the exhibition of samples of the kinds of goods used in foreign lands and illustrations of the methods of preparing and putting up such goods as command the favor of the purchasers. This is particularly true in China. It has not unfrequently occurred that the sale of foreign goods has been greatly crippled by having some label placed upon it that was offensive to the Chinese superstition or tastes. Many colors have peculiar recognition by the people; some offend their tastes and others their superstitions. Some are all right on some kinds of goods and all wrong on others. Simply naming these things will not supply sufficient data from which to prepare them. It must be remembered that Chinese art is very peculiar, and a tiger, as ordinarily represented by foreign artists, would not meet with favor with these people. It must be a tiger according to Chinese imagination and art, of unreasonable length of body or bigness of head or curve of tail, and impossible attitudes. On a popular Japanese match box is displayed a monkey standing on its front feet, head nearly touching the ground, with hind feet up in the air, and tail whipping the skies. The grotesque and even hideous, to the American mind, tickles the fancy of the dwellers in Far Cathay. No description can supply adequate information to an engraver or colorer by which he could produce the real thing, and any departure from the Chinese fancy in such things would brand the goods at once as the product of a "foreign devil" and doom it to defeat.

THE sanitary district of Chicago has awarded a contract for an eight-track swing bridge over the drainage canal at Campbell avenue, to cost $320,000. This swing bridge carries the tracks of the P., C. C. & St. Louis, C. & N. P. and Union Stock Yards & Transit Company. The length of the bridge is 316 feet, width 112 feet, and weight of steel 40,000 tons. This is the largest swing bridge in the world, the next largest being that over the Harlem river, on the New York Central road line.

Mining Summary.

CALIFORNIA.

Alpine.

The mines near Woodfords are to be reopened.

Amador.

Dispatch: Sinking in the Pocahontas at Drytown progresses. A drift is being run to connect the Pocahontas, Edson and California.

The Wildman-Mahoney at Sutter Creek is sinking the new three-compartment shaft at the rate of 100 feet per month.

At the Klondike mine near Slabtown surface ore assays $13 in free gold; at the water level it assays $45.

Record: The shaft at the Oneida has reached 1450 feet. At 1500 feet drifting to the ledge will be commenced. Sinking will not be discontinued when drifting is begun.

The *Record* says that the ledge on the Benoist property is 50 feet thick and averages enough to justify the erection of a mill.

Butte.

(Special Correspondence).—The Butte Co. Electric L. & Power Co. has obtained a franchise and is erecting its lines. The capital stock is $150,000, all subscribed. The officers of the Co. are Robt. A. Friedrichs, O. T. Webber, S. J. Hendy and R. White.

Chico, Jan. 18th, '98.

P. Riordan is building a 5-stamp mill on his mine near Enterprise.

D. Jacocs sold to J. M. McClung and C. A. Brazelton one-third of the Mammoth and Monumental at Forbestown.

The American Gravel M. Co. of San Francisco is opening a claim opposite Centerville.

Capt. Thos. Couch and Frank Southerland have launched their dredger on Feather river, seven miles northeast of Biggs, and the machinery is being placed. The dredge is expected to handle 2000 cubic yards per day at a cost of 3 cents per cubic yard. The ground is said to pay from 15 to 40 cents per yard throughout the tract of 1200 acres.

Calaveras.

Operations on the May Day are in progress. C. Y. De Lay is Supt.

At the El Encino, at Junction, the old incline has been cleaned to a depth of 70 feet. J. Regan is Supt.

The Dry Creek M. Co. began suit against the California.

The Spanish Bar placer mine, above Esperanza, is to be operated by an hydraulic elevator.

A tunnel is being run on the Wickham property which was bonded some time ago by a Scotch company.

J. N. Burns started work on the Oriental mine.

The Farrington G. M. Co. is working on the Beeler property.

Demarest & Co's. mine and 5-stamp mill, on Cherokee creek, are in operation.

H. & O. Beauchemin ground three tons of rock last week which paid $50 per ton.

Six tons of ore from the Mitterbauer property yielded $310.

Good rock is being taken out at the Blizzard.

The company that bonded the Herbert ranch is sinking a shaft to tap the ledge. It has reached 60 feet.

Echo: Operations have ceased at the Calaveras Con. mine, at Robinson's Ferry, the tracks taken out, and the machinery moved.

There are employed in this district, says the *Echo*, 451 stamps, numerous arrastras, seven chlorination furnaces, and one cyanide plant.

The Blair mine, on Smith Flat, started last week.

Del Norte.

The work of clearing the tunnels on the Union copper claim at Low Divide is advancing, so that Kemp, the Iron Mountain Co.'s representative, is enabled to examine the ledge and make his report.

El Dorado.

(Special Correspondence).—The Montauk M. Co. are making several notable improvements in their electric and hoisting plant. The mill is running on fair grade ore from the 600 and 700 levels.

The Try Again hydraulic mine, a new venture, is ready to begin operations as soon as the weather modifies and water can be had.

It is current news here that work is soon to be started on the Columbus mine, an old-time property of good record.

J. B Polk has brought suit in partition of the Gold Note and Philadelphia mines against the Septimus Development Co. and Parker Bros. The property is situated at Omo Ranch P. O., twenty-seven miles east of here.

The Boulder M. Co. has secured daily mail service and changed its postoffice from Rescue to Shingle Springs.

Placerville, Jan. 18, '98.

Beilick & Gray have exposed a ledge of good rock near Fairplay.

A. Herrill is taking out good rock at his Inaugural mine, near Coloma.

In the Pittsburg, fifteen miles above Placerville, the tunnel is 400 feet.

Nugget: The upper tunnel in the Skinner mine, adjoining town, is 80 feet to the vein, and 300 feet on the vein. The lower crosscut tunnel is 225 feet to the vein, 57 feet on the vein and 40 feet across, with no footwall in sight. There are thirteen tons at the mill awaiting crushing. The mine has produced $10,000 since Dec. 15.

Kern.

The Wedge mine, at Randsburg, is being developed with encouraging results. From a recent millrun nearly $5000 was obtained from forty tons of ore.

Valuable copper discoveries are said to have been made near Granite Wells, twenty-six miles east of Randsburg.

One hundred men are employed in the Yellow Aster Co.'s mines.

Ore was discovered in the W. J. Bryan mine last week, 16 to 18 inches in width, said to be high-grade.

The company that built the railroad to Kramer have let a contract for the building of a 50-stamp mill at Barstow.

Fire destroyed thirty buildings in Randsburg last Wednesday. The loss reaches $50,000, with little, if any, insurance.

The *Miner* is informed that the Yellow Aster M. Co. will soon put in four gasoline hoists.

Lassen.

(Special Correspondence).—The mines of Hayden Hill are on a stable basis. The Golden Eagle after a successful summer's run is closed down for the winter. A cyanide plant for the treatment of tailings, which was added to the mine's equipment last spring has proved a success.

The Hayseed shaft is being sunk to the 280 level, and other operations are for the present suspended. The mine promises to become one of the best in the camp; the ore averages about $20 per ton.

The Hayden Hill Con. M. Co., a corporation of local mining men, is driving a tunnel into the hill from the southeast. They are now in about 1900 feet and the work is being pushed ahead.

Mariposa.

(Special Correspondence).—S. B. Terrill, of San Jose, who has recently purchased the Geary claim, near the Tendron mine, at Whitlocks, is erecting a 4-stamp mill on the property.

The California Exploration Co. has taken over the two claims belonging to Mark Parker and A. Shimer, adjoining the Virginia mine on the southeast. These claims cover 3000 feet of the lode and the price is in the neighborhood of $10,000.

A number of Fresno parties are negotiating for a bond on a group of six or seven claims belonging to Thos. M. Carroll, located near the Crown Lead properties between Coulterville and the Merced river.

M. J. Heller, representing J. W. Mackay and others, has secured an option on Marble Springs property, on the North Fork of Merced river, from Miner Hilliard and H. Hedges. The consideration is not stated.

Sinking of the three-compartment shaft is in progress at the Mary Harrison. About forty men will be employed in the development work on the mine.

Surveys are in progress for a wagon road from Coulterville to the Sierra R. R., near Chinese Camp. The new road will follow closely the mother lode, past the Penon Blanco and Moccasin creek, and will be about ten miles shorter and much easier than the route via Priests. The cost will be defrayed by private subscription.

Mariposa, Jan. 17th, '98.

The Geary mine, on Whitlocks, was recently purchased by Terrill & Schroeder who are developing the property and erecting a mill.

The Boston News Bureau, under date of Jan. 8th, publishes what is apparently an authorized statement by the Merced management of the condition and plans of the company. Briefly it is that the mine for the past six months has been producing from $10,000 to $15,000 monthly, which has netted a small profit each month and paid for the development work; that the ore has yielded "over $7 per ton" and costs a little less than $6 to mine and mill, an apparent profit of $1 per ton which can be increased to $3 if the ore can be treated "in bulk" whatever that may mean. That certain interested parties will now lend the company $60,000 for development and if 120,000 or more tons of pay ore can be blocked out in addition to 60,000 tons said to be already in sight an assessment will be levied and the mill facilities enlarged with the aim or earning a dividend of $3 per share.

While the statement as a whole agrees pretty closely with the known facts, as they are understood locally, parts of it are liable to be misleading. It will be a surprise to learn that the monthly output is so low as $10,000 to $15,000. It has been generally believed to be much higher, especially for the past ninety days, but no definite figures are obtainable as the company ships only part of its bullion by express, the remainder going by private messenger and leaving no record. No account seems to have been taken of the rich streak of rock which is known to exist in the Mary Harrison mine, although it was very much in evidence at the recent preliminary examination of the miners charged with ore stealing. The manager then testified that the ore in the streak stolen on which the two men had been kept at work was worth about $10,000 per ton, and several sacks of the rock now in custody of the sheriff as evidence appear to substantiate the statement. The local manager armed with search warrants is still searching miners' houses for more of the ore, and it seems unlikely he would do this for such amount of $7 rock as the men might carry away in their dinner pails. The ore on the 600 level is known to show considerable gold when broken, and looks to be better than the figure stated. If the mill, which has been crushing fully 100 tons per day, has saved $6 per ton and the men working on the specimen streak have sent down even a fraction of a ton per month, it would seem that the output is understated.

The statement that the mine has paid for all development work is literally true but loses some of its force when it is recalled that no development work has been done, the local management not even being allowed to sink the shaft below the 400 level while stoping on the 600. The estimate of $500,000 in machinery, shafts, etc., on the mines now closed is probably an error. Exclusive of the Mary Harrison mine all the improvements on the property will hardly foot up half that sum. In the course of recent land office proceedings affidavits of the value of most of these improvements have been filed in San Francisco by officials of the company. These set the value of the 1000-foot Malvina shaft, buildings and machinery at slightly less than $42,000 and all other mining improvements on the west vein at $8000. It is probable that the workings on the Malvina vein amounting to some 3000 feet of crosscuts and drifts and a 400-foot winze were omitted from this statement, but for these $40,000 should be a liberal figure. The 40-stamp mill in the same showing is set down at $65,000, which is about double the ruling cost of similar plants in the State.

The only other work of consequence on the abandoned mines was the Nelson shaft on the Louisa mine, which was sunk 300 feet, with a winze about 300 feet deeper, and something like 1500 feet of drifts and crosscuts, for which $55,000 would be a liberal estimate. The company's other improvements and their approximate cost are: Storage reservoir, $15,000; tramway, $10,000; machine shops, assay office, etc., $15,000; this makes a total of $250,000, of which about one-half is based on sworn statements from the company's office. Any one familiar with California prices can slightly vary the figures perhaps; they only purport to be approximations.

The stockholders have paid in $12 per share on 100,000 shares, of which $300,000 is understood to represent the purchase price, the balance of $900,000 (increased by at least $100,000, which is known to have been taken out in the mill), has all gone into the property, except $20,000 reported as in the treasury since the mine became self-sustaining.

The dividend of $3 per share, which the News Bureau contemplates would thus be equivalent to 25 per cent per annum to the stockholders as they stand to-day, or to 20 per cent as they will stand if the balance of $3 per share shall be called in. This would certainly be a handsome return on the investment, but the suggestion of so high a rate of dividend savors of the kiting which sent the stock up to $40 two years ago before a mill was placed on the property. There are 100,000 shares; therefore, to earn a $3 dividend there must be net earnings of $300,000, and, even if the ore is "handled and milled in bulk" at a profit of $3 per share as outlined, there would have to be milled 100,000 tons per annum, or 8333 per month. The best that the 40-stamp mill can be expected to do is 2700 tons per month, so the milling capacity would require to be trebled at least.

Unless new and large shoots of ore can be uncovered it is preposterous to expect the Mary Harrison mine to sustain a 120-stamp mill, and there is little prospect of the mines once opened, and now abandoned, lending much aid to swell the dividend roll. The test run of the Louisa ore netted something under $2, if we recollect rightly, and the 5868 tons milled, principally from the Malvina, in March, April and May, '96, averaged, according to published statements, $2.63 per ton in gold and 62% in sulphurets.

The policy of the company in borrowing $60,000 from some insiders at a time when there was yet $300,000 due on stock, and subject to call, has been questioned. If, as the News Bureau says, the mine "is largely owned by its managers and directors," it may seem immaterial whether these latter furnish the money as a loan or as an assessment on their stock. In case, however, the property should fail to realize expectations, the difference in position between judgment creditors and stockholders would become material, and the loan would savor less of philanthropy.

We have no disposition to decry this property; it has suffered enough; its record is history now. A million and a quarter dollars have gone into the property, one claim out of thirteen has been proven valuable, but the improvements which the company has placed on that, together with the mill, reservoir, tramway and shops could be duplicated for $150,000. Most of the rest of the vast sum is gone. The Mary has made a plucky up-hill fight and has won it by demonstrating that she can yet pay her way and more. With reasonable capitalization and efficient management she will have as bright promise as any mine in the State of California. It is unjust to saddle her with the million dollars which was squandered on the property. It is unfair to stockholders to lead them to expect that they may receive 25 per cent dividends on this wasted money.

These are the things we deprecate, especially at a time when every scribbler seems to think he has license to attack California mines and mining investments. Our mines are all right if managements will give them a show.

Nevada.

(Special Correspondence).—The Mud Springs and Lily mills have temporarily shut down for the want of sufficient water. Both these mills depend upon water from their shafts to supply their engines and batteries; owing to the failure of rains the supply of water is now extremely low. Both of these mines have ample supply of ore in sight.

Ellis & Thrower are developing the Glen mine near O'Neals. This vein has heretofore furnished good ore.

W. R. DeFrees is reopening the old Reub Williams mine, at Hildreth.

At the Live Yankee, near Graniteville, an encouraging gravel deposit has been encountered in the main tunnel.

Telegrayh: Lauctot & Barnett on the Monitor have a 6-foot vein which has been traced on the surface for 3000 feet. The ore prospects well.

Union: The Manzanita mine, at Sweetland has a permit to hydraulic. The company will begin work so soon as the water season opens.

Transcript: At the Cadmus the mill is running on ore from the 320 level. On the 500 a crosscut is being run to tap the ledge.

At the Home the shaft is 400 feet on the ledge.

Union: I. Haas has purchased a third interest in the Alta-California placer mine.

Supt. Buffington reports progress at the Kirkham mine. The new mill has commenced crushing. The prospects are encouraging.

J. R. Ritchie moved his mill from Maybert to Omega to prospect the Celia quartz mine.

Union: It is reported that a new chute of ore has been struck at the Gaston Ridge mine.

Tidings: The Eagle Bird, at Maybert, will be opened for work next month. Good ore is being taken out. Good ore is taken from the Round Mountain mine, a mile from Navada City. This is a new section. The Mistletoe, near Rough and Ready, will be opened by Grass Valley and Nevada City men.

Placer.

The Jupiter Con. G. M. Co. was organized in Auburn Jan. 8th, to operate the Winchester and Jupiter gravel mines on the Iowa Hill divide.

W. Rablin, of Dutch Flat, has started work on the tailings of the Alta.

H. Sangmaster is working in his claim at Shady Run.

The statement of the Pioneer M. Co. for December is as follows: Tons rock crushed, 780; value gold bars, $11,461; payroll, $4103; bills, $1518; total expenses, $5621; net earnings, $5839; average value rock, $14.70; men employed, 49.

Plumas.

Bulletin: D. M. Butterfield has taken ten nuggets from his mine, one of which weighed $41 and another $140.

San Bernardino.

A sale is reported, twelve miles from the Needles, of a group of six mines by Seburn & Shafer for $50,000 to Missouri capitalists, who will put on machinery.

San Diego.

One-half interest in the California mine in Defiance district has been sold to W. S. Clark for $1000.

Shasta.

(Special Correspondence).—Development on the Mt. Shasta property, four miles from Shasta, is progressing. Work on the surface cuts and tunnel has produced sufficient good ore to reimburse the purchasers, who are said to have paid $8000 for the property.

At Muletown, near Shasta, a prospector is taking out ore that nets him $380 per ton. This district is producing some good properties. The ore is mostly a smelting proposition, but all of it yields good values.

Work on the Dry Creek Slide, owned by McCarthy & Co., is moving rapidly. The property comprises five claims and is about one-half mile above the smelter. The tunnel is over 400 feet on a 4-foot vein of medium grade. There will be rail connection with the Mountain Copper Co. smelter, to which they will furnish thirty tons per day.

Shasta, Jan. 17th, '98.

Press: W. Z. Turney has a ledge near Clover assaying $18 per ton.

The Three Sisters mine, near French Gulch, is bonded for $20,000 for nine months to Howell & Motherwell.

F. Hurst is developing the Colorado mine, near Whiskytown, which he recently purchased from G. Lyman.

E. P. Connor of Middle Creek, in his Corrinne location, crosscut the ledge at 130 feet, drifted 62 feet, made an upraise of 60 feet, in ore all the way, that will mill $30 a ton.

At the Afterthought smelter on North Cow creek, from 1000 tons of roasted ore, sixty tons of high-grade matte was obtained. The smelter closed down January 4th for a short time pending the settlement of the estate of J. Enright.

Searchlight: Assays of the tailings at the Niagara mine run from $5 to $7 per ton. Investigations show it would be profitable to treat them by the cyanide process. The dump contains 3000 tons.

The Milkmaid mine at French Gulch, under the supervision of D. B. Hunt, is doing well.

LaDue & Adams, on Portuguese Flat, are drifting into good pay gravel.

The Kotzebue C. & M. Co. of Redding, formed to carry on mining business in the Kotzebue sound country, Alaska, decided to purchase the Andrew Hicks sailing vessel. The intention is to start in April.

Sierra.

(Special Correspondence).—Ed. Brown has bonded the Kennet mine, comprising two claims, with an 18-stamp mill, to Los Angeles parties. The property is two miles below Alleghany.

Siskiyou.

The Aromas Co. began work near Sawyer's Bar. A hydraulic elevator will be worked in addition to giants.

Good quartz has been found in the Mexican mine on the South Fork.

The Schroeder mine shows richer ore on the 1200-foot level than at any place above.

The new company, which bonded the river bottom along Scott river, between Etna and Callahan, started prospect work last week.

Work is progressing at the Salmon River Hydraulic M. & D. Co. About 6000 feet of ditch is completed, also 1150 feet of flume, with two miles of flume and a mile and a half of ditch to build. Two giants will be in operation.

The Distlehorst dredger is still at work in the Klamath river.

The Manaha mine, on Salmon river, has begun operations under the supervision of W. C. Stanly.

Trinity.

P. Larcine is opening a body of cinnabar ore at New River.

The Integral Co. is developing its property at Cinnabar.

At the Highland mine, Taylor's Flat, piping is carried on three hours a day. As soon as the water comes the mine will be worked night and day. G. Pelletreau is Supt.

Tuolumne.

Sinking on the vein of the Arbona, at Tuttletown, was resumed last week at a depth of 180 feet. The shaft will sunk 1000 feet.

A mill will be erected on the Sell mine, in Sonora.

Yuba.

A few men are at work in the Pennsylvania mine, Brown's Valley.

The *Appeal* says that the Good Title Co.

is adding five more stamps to its mill, making fifteen in all. T. J. Carson is Mgr.

NEVADA.

At Tuscarora the Dexter is erecting a mill and putting in an electric power plant. The cost will be $100,000. They employ 125 men and pay $3 per day.

J. Smith has secured a bond on the old Wilson mine at Pine Grove. Future operations will involve an outlay of $75,000. The tailings dump amounts to about 25,000 tons and is valued at $9 per ton. This will be handled at the rate of fifty tons a day, while the mine itself will be worked steadily. The ore averages $25 per ton.

At the Golden Eagle M. Co.'s property in Humboldt county the vein recently encountered shows an average of $54 in gold. The vein is 6 feet wide. C. Wilbur is the Gen. Mgr.

At DeLamar the output is averaging 300 tons a day.

The ledge in the Mountain View is 4 feet wide and shows native and horn silver.

The tunnel on the Zip Coon and Gold Eagle at De Lamar has cut a promising 4 foot ledge.

The ore in the Star's lowest workings at Ely is from 6 to 7 feet wide.

Gaby & Buntin at Osceola have uncovered a good vein on the Exchange mine.

OREGON.

At the Abbott mine, near Grants Pass, a tunnel has been run 70 feet on the lode, which is 2 feet wide, in free milling ore ranging from $50 to $75 per ton. There are twenty-five tons of ore on the dump.

The Oak Flat Hydraulic M. Co. has two giants in operation.

A. Lemke has a 5-foot vein of high-grade ore which has the appearance of copper sulphides. The mine has 1200 feet of tunnels.

Two No. 1 giants and 1400 feet of pipe are being placed on the Powell creek property, near Grants Pass. E. M. Corbus is Supt.

Supt. W. O. Reynolds of the French-Flagstaff M. Co., Baker City, is adding machinery for the cyanide process.

The Timber Canyon mine near Sparta has a vein 4 feet in quartz porphyry. Development work is progressing. There are nine claims in the group. If the mine meets expectations it will be ready in the spring for a 20-stamp mill.

The Flagstaff near Baker City has ceased work for six weeks, until the cyanide process is in place.

WASHINGTON.

The New Year at Colville has reached 30 feet on 4 feet of ore that will run forty-four per cent lead and fourteen ounces silver.

The German American Co. on the Colville reservation has finished a tunnel which taps the ledge at 230 feet depth, and another contract for 100 feet has been let. The ledge is 60 feet wide.

BRITISH COLUMBIA.

(Special Correspondence). — Several members of the Golden Cache Co. at Lillooet have put in an application for 5000 shares of treasury stock at $1 per share for the purpose of continuing work on the mine and ascertaining to a greater extent the continuity of the vein. In the open market the stock is selling at 50 cents, having dropped to that figure from $1.80 as a result of thirty days' run of the Golden Cache mill, which proved 750 tons of ore to contain an average of $4.40 per ton in gold.

Vancouver.

The Snowshoe at Greenwood has been bonded for $65,000, payable 10 per cent April 1, 10 per cent July 1, 40 per cent October 1, and balance on January 1, 1899. There is a shaft 70 feet on the footwall, from which good ore is obtained.

With an increased water supply the Tinhorn mine at Fairview will mill forty tons per day, instead of four tons, as heretofore.

The Fern, near Nelson, returns a net profit of $16,500 for three months from a 10-stamp mill.

The Channe M. Co. have decided to reduce the amount of capitalization from $1,000,000 to $250,000.

The London & British Columbia G. F., at its recent annual meeting, reported the profits of the Ruth £31,941.

The *Spokesman-Review* reports the Wallingford group in Rossland sold to an English company for $75,000.

Mr. A. S. Hallidie of San Francisco is this week in receipt of several specimens of ore from Quatsino sound, in the extreme northern part of Vancouver island, which illustrates the remarkable mineral wealth of that region, which is as yet almost wholly undeveloped. The specimens show gold, copper and other metals, and indicate a profitable field for active work.

The Chieftain of Cariboo has been bonded by Burns & McKenzie for $65,000. The Southern Chief of Slocan has been sold for $2500. The Iron Mountain group, near Christina lake, has been bonded to Hobbs, Jeffrey & Co. for $50,000. The property is equipped with a 10-stamp mill. The Relief, near Creightown, is under bond for $30,000. There are 400 tons of ore on the dump.

The British America Corporation of London, which had the Alaska Commercial Co., the Le Roi mine and other ictas—in its prospectus—seems to have miscalculated all round. Now the deal for the Le Roi is off, W. D. Turner, president of the Le Roi M. & S. Co., says: "I never thought for a moment that a sale would be consummated to that company. To my mind it looked much as if the people who drew that prospectus used the name of the Le Roi mine to attract the attention of the English investing public. They never had the right to use the name of the mine in any way, but their prospectus was cleverly worded. In this country, however, such actions would be termed obtaining money under false pretenses. The mine is in good condition and has a large daily output. It was the intention to start up the smelter this morning, but owing to a delay in securing coke the opening has been postponed."

THE KLONDIKE.

Dawson City residents state that they have received no mail since July and August, and they know nothing of what has happened in the outside world since late in September.

The begira of '98 has begun; the steamship Walla Walla sailed from San Francisco last Sunday with 360 passengers for the Klondike.

SIBERIA.

There are now about 40,000 miners at work in the gold mines of eastern and southern Siberia. The grains of Siberian gold are said to be on an average larger than those of any other part of the world. All efforts to obtain anything like correct information regarding the output of gold in Siberia have so far proved unavailing. No one outside of a few Russian officials is permitted to know.

IDAHO.

The report recently sent out that the Iowa mine in Boise basin had been sold for $75,000 is denied. A 10-stamp mill is running steadily on part of the product but the ore is base. The cyanide process will be introduced.

The Poorman at Burke has been closed indefinitely and over 100 men are thrown out of employment.

Adjoining it is the Hope mine, on which work is progressing under bond.

At the Camas No. 2 the cyanide plant will be started as soon as the weather permits.

At the Tip Top they are taking out ore that yields $30 gold in addition to considerable copper.

Work has been resumed on the tunnel of the Kootenai M. Co. on Mica peak, at Cœur d'Alene. It is in the ledge 175 feet, and shows a body of ore which assays from $10 to $25.

The mineral product for '97, as estimated by the Government assay office in Boise, is: Gold, $2,500,000; silver, 5,500,000 ounces: lead, 100,000,000 pounds. Computing the silver at the coining value, and lead at 3½ cents, gives the following figures:

Gold	$2,500 000
Silver	7,100,000
Lead	3.510,000
Total	$13,110,000
Production in 1896	11,762,845

UTAH.

The Sacramento at Mercur is treating 100 tons of oxidized ore daily.

A company has been organized to operate the Granite Mountain group at Mercur. They begin sinking at once and work will be continuously prosecuted.

A carload of ore from the Utah at Fish Springs was marketed last week yielding 100 ounces silver and 35 per cent lead.

G. H. Townsend has inaugurated work on his property at Deep creek.

Promising copper mines have been discovered near Vernal. There are two veins, one 3½ feet deep which assays 47 per cent copper at a depth of 50 feet, and another 6 feet, which returns 17½ per cent copper.

At Mammoth the Sioux-Ajax tunnel is in about 3000 feet. The connection of the tunnel with the Sioux ore bodies promises to make a very heavy producer of that property.

The Mercur mine at Mercur is turning out 300 tons a day.

The *Tribune* says that the consent of the railways to a reclassification of cyanide of potassium means a saving to the Mercur camp alone of $10,000 a year.

Six cars of crude ore were shipped last week from the Horn Silver mine.

Late advices from Silver City state that the Sunbeam made a strike showing 40 ounces silver, 30 per cent lead and 15 per cent copper.

SOUTH DAKOTA.

H. Schenk has sold the North Star group, near Custer, for $15,000.

The shaft of the Chicago and Two-Bit Co. has reached 110 feet.

MONTANA.

Montana's mineral production last year reached nearly $53,000,000, an increase of $2,000,000 over 1896.

W. G. Galigher is shipping ore from the Tilden mine, near Argenta.

Ormsly & Leash made a five-ton shipment of galena ore from the Buckeye No. 1 at Sheridan.

Three hundred sacks of ore were shipped from the Fisher mine, near Sheridan.

L. D. Porter has bonded five claims near Junction. A carload of ore from this mine averaged $50 per ton.

Planlapp Bros. shipped 500 sacks of high grade ore from Nobleville.

The Butte *Miner* presents the following figures showing the production of copper in pounds fine for Montana from 1882 to 1897:

1882	9,058,284	1891	112,359,320
1883	24,698,345	1892	161,051,477
1884	43 098,951	1893	154.3 0. 00
1885	67,707,861	1894	183.494 755
1886	57,611.621	1895	194 788,925
1887	78,699.677	1896	228,958,184
1888	97,8 7,0 8	1897(estimated)	2 0,00.0,000
1889	98,222,444		
1890	110,955,733	Total	1,872,571,629

Taking copper at an average value of 11 cents, the total value of copper alone taken from Butte is $200,000,000.

The largest mining shaft in Montana is on the West Colusa property of the Boston & Montana Co. in Butte. It is a three-compartment shaft with end pieces 9 feet in the clear, and wall plates 16 feet 8 inches in the clear. The shaft is being sunk from the 800 to the 1500-foot level. Mules are to be introduced in the mine for hauling ore to the shaft in long distance levels.

The Livingston Union Coal Co., four miles west of Livingston, is turning out fifty tons of coal daily. The management has put on an additional force and will increase the output to seventy-five tons daily.

ONTARIO.

(Special Correspondence.)—The Golden Star M. & Ex. Co. of Ontario are working thirty-five men. Depth of shaft 159 feet, length of drifts at 75-foot level, north 105 feet, from which point a winze, to connect with the 150 foot level, is now 40 feet, south drift 80 feet. Average width of vein 4 feet, average value $14 72. 82 per cent free, silver from $1 to $2; 1200 tons of ore on dump.

Bonheur mine, in Saw Bill district, depth 210 feet, stoping from 60 and 120-foot levels, ten stamps and two plain belt vanners and one corrugated belt vanner. Monthly output about $6000.

Olive mine, depth 110 feet, 2-stamp prospecting mill, output from 176 tons, $7,852 50.

Duluth, Minn., Jan. 10th, '98

At the Caldwell mine, Rat Portage, eighty tons are crushed daily and the value of the ore is said to be $15 to $20 per ton. The shaft is down 400 feet, and a 30-stamp mill is in operation.

The Mikado, in the Rat Portage country, is producing $20,000 to $25,000 a month.

At the Regina, Lake of the Woods, the main shaft is 385 feet. The ore increases in quantity and value with depth. There is a 20-stamp mill in operation.

The Little American, at Rainy Lake City, has struck ore on the 210-foot level that mills $30.

COLORADO.

The Nightingale resumed shipments with three cars of ore. One car will average one ounce, and two cars were of two-ounce ore.

The May Belle, at Lawrence, has been leased to an Eastern company for eighteen months, which will at once resume operations.

The Pharmacist received returns on a portion of last week's shipments, showing a decided gain over shipments marketed for some time. Three tons brought $598 a ton, and nineteen tons $98 60 a ton.

An entire train load of mineral, of an estimated value of $100 a ton, was sent out last week from the Emma No. 2, at Cripple Creek—the result of a week's work.

Keith & Co. recently made a 10-ton shipment of two-ounce ore from the Homestake.

Production on the Dickerman the past week averaged above forty tons a day, and the ground opened will permit this output for several months.

The Colorado King, Cripple Creek, is sinking its shaft for a second level. The ore body holds out under all development done, and is good for weekly shipments of about two-ounce grade.

Work has started on the Surprise, at Yankee Hill. This property was recently sold to Colorado Springs parties for $15,000.

The Ivenness, in Clear Creek county, has found pay-streak at a depth of 52 feet. The vein is 5 feet wide.

The tunnel on the Chamberlain will cut the new find, in 1800 feet, at nearly 1000 feet depth.

At Yankee Hill B. Warner has secured a bond on the Eureka. It has a vein of sulphide ore 15 feet wide, averaging $20 per ton.

The Wire Go'd Group, at Yankee Hill, has been bonded to a New York company for $50,000, half of which was paid in cash.

The Whale mine, in Clear Creek county, has been bonded to Thrall & Co. The shaft is in 50 feet on a good vein. The Louisa has been bonded to Bell & Co. Both properties are to be developed.

The mill at Yankee Hill is completed on the Alice placer. The mine is owned by Crocker of San Francisco and is managed by Taylor. The vein is a dyke, 400 feet wide. The mineral across this entire deposit runs $10 in gold.

The A. Y., at Leadville, has been started by J. R. Newton & Co.

After eighteen months' cessation, the Rex shaft at Leadville will resume operations. It is understood that C. M. Priddy, T. S. Woods, C. Boetcher and Baer Bros. are leading spirits in the enterprise.

A drift has been extended 140 feet on the 350 level of the Garbutt, at Leadville, which shows well in copper sulphides.

At the Thespian mine, Leadville, a drift is being run on the contact between the porphyry and lime which has reached 160 feet.

The returns from the last Ridgway shipment, at Silverton, were $1800.

Froch Bros. & Heck, of Victor, disposed of their Gold Star lode to J. Ellis & Co. for $30,000.

W. E. Waybright has control of the Atlas property, Lake City, and will at once develop it.

R. Taylor, of the Sherman mine, near Lake City, struck ore that will run 175 ounces copper.

Mineral county in 1897 produced $217,000 in gold, a gain of $164,117 over 1896.

The Weir, at Cripple Creek, at 75 feet has a 2½-foot vein of talc, running four ounces in gold.

The Colorado G. M. Co., operating near the town of Gillett, has installed an air drill and compressor. The breast of the bore is in 300 feet and will be driven another 200 feet before any drifting is done.

One hundred and twenty tons, of an average value of $75, were shipped from the Abe Lincoln last week.

On the Granite Hill a new body of pay ore has been encountered at a depth of 180 feet.

A. Edwards is taking out copper, iron and honeycomb quartz on the Queen Blanche, near Boulder; the average assay is $15 in gold.

The Vindicator, at Cripple Creek, is running forty tons daily.

D. H. Weaver is driving a tunnel on the Blue Cut, near Boulder; the quartz assay is $12 per ton.

The Independent mine, at Saguache, is cleaning up $1400 a week.

Hazzard & Brown, near Saguache, have a 5-foot vein assaying $30 per ton.

On the Big Six, at Leadville, the vein recently discovered opened out to 6 feet and is rich in iron carbonate containing a small percentage of lead plentifully covered with native silver.

Ten tons per day is being shipped from the Waldorf shaft, of the Black Prince porperty, at Leadville. The ore carries silver, gold, lead and iron.

The Boston & Trinidad G. S. & R. Co. has been incorporated, to operate the smelting and reduction works at Trinidad, general offices in Denver. Capital stock is $1,000,000. H. L. Prentice, R. C. Roy and E. P. Smith are the directors. The smelter which the company is to run has been in course of construction for two years past and is just completed.

The Portland, near Gladstone, made a new find, averaging 4 feet, giving returns of 9 ounces silver, 52 per cent lead and 14 per cent copper.

The Mollie Gibson and Argentum at Aspen are about to erect a concentrating plant of 700 tons daily capacity.

Large shipments of manganese iron continue from the Catalpa and Crescent mines at Leadville.

The Dollie B. shipped four wagon loads of mineral, the first shipment made by this mine.

The Ingham at Cripple Creek is shipping fifteen tons a day, the ore averaging $30. The Jack G. was bought by the Ingham on a bond for $35,000; proceeds of the royalties paid for the property in sixty days.

Rountree & O'Brien of the Deadwood at Cripple Creek made a 15-ton shipment of $90 ore last week. Goldfield mines produced 350 tons of ore a day during the past month. The Crawford at Cripple Creek shipped four carloads last week of $80 ore. The January output thus far of the Vindicator will average forty tons a day. The Lillie at Goldfields is making a regular output of thirty tons a day. The Silver Mountain Co., at Georgetown, last week, shipped the first car of ore. It assayed $75. D. Wood, near Ouray, uncovered galena ore in the Faith mine, carrying sulphurets, yellow copper and silver.

NEW MEXICO.

The Crown Point group, near Bland, has been bonded by the Cochiti G. M. Co. for six months, during which time $10,000 is to be expended in development. This is practically a sale for an amount exceeding $100,000. The development work amounts to about 1500 feet. The average value of the ore is $30.

The Victor group has been bonded to H. Posey for $20,000 for six months. The Victor possesses a vein 14 feet wide at a depth of 65 feet.

New Mexican: Development work is in progress on the bodies of gold-bearing quartz at Amizett, La Belle, Red River, Elizabethtown, Cochiti, Dolores, Golden, San Pedro, Hillsboro, Pinos Altos, Mogollon, White Oaks and other districts.

The Ortiz Co., a mile from Dolores, is doing extensive work. The shaft is 300 feet. The company employs thirty men. L. C. Erman is Mgr.

ARIZONA.

A complaint has been filed at Prescott in connection with the Crowned King M. Co., suit being begun by O. F. Place, owner of more than one-third of the capital stock of the company, against the company. The complaint alleges that Sheckels and Herrington in 1894 caused themselves to be made joint superintendents of the company's property, and, being in control, had their salaries fixed at $1200 per month to manage a 10-stamp mill and an average of thirty men, besides $550 per month paid the mine foreman, mill foreman, bookkeeper and assayer; that a competent and skillful superintendent can be had for $400 per month, and that the present superintendents work the mine as follows: Sink 100 feet at a time, then stope out all valuable ore and run it through the mill, then shut down the mill and sink another 100 feet, making no development, but in this way gutting the mine. The bill states that only nominal dividends are being paid, and the profits, which should be at least $100,000 per year, are being wrongfully appropriated.

The Mocking Bird mine, Mohave Co., shipped a bar of bullion last week. The Providence G. Co., Yavapai Co., is building a 20-ton chlorination plant. V. H. Igo has bonded a group near Tombstone for $10.000. Ewing & Helmrod have purchased the Kingman Sampling Works. Cushing & Doran have bonded a group adjacent to the Congress mine for $40,000. One hundred and eighty men are employed by the Table Mountain Co. at Klondike. A smelter will soon be in operation. West & Rice of San Francisco are at Kingman awaiting the arrival of the mills they purchased for the C. O. D. mine. The Gold Reef group, in Cochise Co., has been bonded to a Kansas City Co. for $40,000. Active work on a group in the Dragoon mountains has been commenced by an English Co. E. L. Giroux, for W. A. Clark of the United Verde Co., has bonded the Copper Belle group on the San Carlos reservation for $50,000, the date of the bond to commence within thirty days after the completion of the survey which segregates the coal fields from the reservation.

The mineral product for 1897 was $4,136,000 in gold and the silver yield was 1,240,000 ounces, lead 888,000 pounds and copper 64,280,000 pounds.

At the Kassar mine the double compartment shaft is completed to 200 feet and the mine continues to show improvement. The supply of ore is abundant.

Four bars of bullion were brought from the San Miguelita mine in Sonora last week.

The Franco-American in Pima Co. continues development with good results.

The Guijas G. M. Co. shipped a carload.

The Old Glory mine is dropping thirty stamps, running eighty tons of ore daily at a cost not exceeding $1.80 per ton for mining and milling.

The Arizona Copper Co.'s concentrator at Clifton was destroyed by fire last week. The store and smelting plant were saved. The loss is estimated at $25,000.

The Saginaw smelter will work on copper ore from the Silver Bell district. It is said there are 3000 tons of ore on the dump.

The Jerome copper mine comprises eleven

claims located across the vein from which the United Verde people are taking ore. It is developed by a shaft, an incline and a tunnel, which will reach the ore body with 300 feet. The main tunnel is 800 feet below the top of the mountain and leads directly to the plant where the ore will be treated.

The United Verde produced 21,000,000 pounds of copper in 1896, and the production in 1897 was still larger. The mine has been sending out sixty to eighty tons of bullion a day.

Owen McNeely of Kingman last week shipped eighteen tons of seven-ounce gold ore.

Stanton & McClellan shipped twenty-two tons from the Oro Plata.

The Temple Bar Con. M. Co. has twenty men at work at Temple Bar putting in the big piers and glance boom. The company expects to have the work completed before the spring rise in the river.

The Oro Plata mine is said to have struck a body of ore that runs twenty-four ounces gold and ten ounces silver to the ton.

R. Toohey has bonded four claims to J. H. Johnson for $75,000.

A. J. Shotwell has bonded three claims in the Ajo district for $75,000. The property is to be worked 20 feet per month, and necessary machinery erected.

Capt. S. O. Hemenway has a plan for a steam dredger for placer mining on the bar of the Yaqui river, Sonora. The boat is 120 feet in length, 26-foot beam and 3½-foot hold, with a recess 20 feet long by 6 feet wide for the elevator to work in. She will draw 10 inches. The elevator will be 50 feet in length, working 16-inch steel cups bolted to a steel endless chain 18 inches apart. The lower end of the elevator will be protected by a "grizzly," so that nothing larger than 2⅛ inches will enter the cups. The inboard end of the elevator will be elevated 12 feet above the deck of the boat. The cups will discharge their contents into a hopper, with chutes on either side, to two jigs of six compartments each, size 24x36x12 inches, with copper sieve bottoms. The material raised by the elevators will pass over 24 feet of fine meshes, and discharge into a tank 6 feet deep, in which revolving paddles will keep moving.

The lead and silver claims at Castle Dome are producing quantities of ore, averaging seventy-five per cent lead and thirty ounces of silver per ton.

Development on the Free Gold Group, in Chocolate mountains, is being pushed, developing a body of high-grade ore. T. D. McLeod is Supt.

MEXICO.

The Panuco Copper Co., in Nuevo Leon, contemplate the erection of a smelter.

The gold mines of the Panuco district continue to ship ore in carload lots running between two and six ounces of gold per ton.

Two Republics is informed that the Compania Aurifera has $60,000 in its treasury.

Reed & Gunby, who purchased the San Luis mine, near Coronilla, Guerrero, are negotiating for the mines and mill of the Compania Mexicana, in the district of Mina. These are thirty in number, and yield gold, silver and lead.

The San Felipe continues to yield gold ore. This is the only strictly gold property discovered near Coronilla.

A good vein of quicksilver has recently been discovered near Tetela del Rio, and is being developed.

The Santa Rosalia shipped seventeen tons that brought $30,000. There is said to be 4 feet of ore in the shaft, which is past the 250 level.

The Esmeralda, near Minas Prietas, Sonora, has 1300 tons of ore on the dump averaging one ounce of gold to the ton.

The Kansas City Smelting and Refining Co. has obtained a concession for the erection of a smelter at Carmen, on the Mexican bank of the Rio Grande.

It is believed the Miguelita group in Sonora, under bond to ex-Gov. Thornton and associates, will be taken by the final payment of $150,000.

SPAIN.

Spain is the home of 11,806 mining companies, among which are represented the following products: Iron, 3027; coal, 461; lead and silver, 31. In these are employed 62,968 men, women and children in the proportion of 85 per cent, 11½ per cent and 3½ per cent.

SOUTH AFRICA.

The December output of the Rand district was 310,713 ounces—the largest monthly total in the history of that district. The output for the entire year of 1897 is 3,034,675 crude ounces, which about equals 2,433,000 ounces fine gold.

Commercial Paragraphs.

THE Lunkenheimer Co., Cincinnati, has been preparing a shipment of valves and machine fittings for South Africa that will aggregate 26,000 pounds. This company has just consigned 4000 pounds of brass fittings to Sweden.

THE A. Van der Naillen School of Engineering has incorporated in San Francisco, capital stock $50,000. Directors are Albert Van der Naillen Sr., Victoria Van der Naillen, Albert Van der Naillen Jr., Ralph L. Van der Naillen and E. E. Cochran.

THOS. J. BARBOUR, mining engineer of the Risdon Iron Works, returned from New York last week. Mr. Barbour was East on mining business, and while in Boston closed a large contract with the North American Gold Dredging Co. for two dredge boats, each of a capacity of 2000 yards per day. The Risdon Iron Works will build these boats on the Swan river in Colorado, and it is believed that the gravel will be worked for from 3 to 5 cents per yard. Mr. Ben Stanley Revett is the general manager, and after looking over the entire field of dredging decided on Mr. Barbour's statements to place contracts with the Risdon.

Personal.

S. W. TRAYLOR of Denver is in Randsburg, Cal.

C. E. CLINCH of Grass Valley, Cal., is in San Francisco.

W. S. MCKNIGHT is Supt. Old Glory mine, near Tucson.

J. J. YECKEL is Mgr. Evening Star mine at Silverton, Col.

L. DURKEE is the new Supt. Guijas G. M. Co., Tucson, Ariz.

RALPH DILLON, Pres. Jerome Copper Co. of Arizona, is in Denver.

E. BIND, Supt. Gold Hope, near Randsburg, Cal., is in San Francisco.

C. D. LANE of San Francisco is in Washington on his way to Mexico.

J. H. MILLER, Supt. Hilda mine, Sierra City, Cal., is in San Francisco.

P. R. BRADLEY, Supt. Spanish mine, Washington, Cal., is in San Francisco.

JEAN F. WEBB, Gen. Mgr. Pocahontas, at El Dorado, Cal., is in San Francisco.

GEO. MCAULEY succeeds W. Rule as Supt. Mayflower mine, Forest Hill, Cal.

B. HANCOCK succeeds F. B. Wilson as Supt. Iron Mountain mine, Keswick, Cal.

J. C. ADAMS succeeds Sam Silverman as Mgr. Badger mine, Elk City, Idaho.

HON. J. H. NEFF was inspecting mining property this week near Placerville, Cal.

R. C. CAMPBEL-JOHNSON has resigned as Mgr. Queen Eess mine in Slocan district.

FRANK MANSON, Supt. Sierra G. Co., Downieville, Cal., has returned from Chicago.

J. S. LAWRENCE succeeds D. McCarthy as Supt. Pharmacist mine, Cripple Creek, Col.

F. J. MARTIN, Supt. Fortuna mine, has returned from San Francisco to Phœnix, Ariz.

J. WEISSBEIN, Mgr. W. Y. O. D., has returned from San Francisco to Grass Valley, Cal.

J. W. GRAY, M. E., has returned to Oakland from examination of property in Siskiyou Co., Cal.

MR. E. I. PARSONS of the California Wire Works has returned from a business visit to Mexico.

WM. C. REYNOLDS of Chicago, who is interested in California mining properties, is in San Francisco.

RD. ROWLANDS of Placerville, Cal., mining man, is in San Francisco on his way home from the north.

JOHN J. HALPIN of New York, Mgr. Brunswick Con. G. M. Co., Grass Valley, Cal., is visiting the mine.

C. M. SHOECRAFT, M. E., of Nevada City, Cal., has charge of the Nevada county exhibit at the Jubilee Fair.

GEO. CLARK, Supt. Laudecker, Placerville, Cal., has charge of El Dorado county's exhibit at the Jubilee Fair.

H. P. GORDON has returned to San Francisco from superintending a hydraulic mine in the U. S. of Colombia, S. A.

P. LANGHAMMER, Ph. D., who has extensive gold properties on the Similkameen, Wash., is in San Francisco buying machinery.

E. EDGAR BURCLE, D. H. Bromley and F. D. Harvey of London are inspecting American mining methods in this State previous to making an examination of some New Zealand mining properties for an English syndicate.

Recently Declared Mining Dividends.

Parrot Co., Butte, Montana, 6 per cent, $138,000; Jan. 1.

Dutch M. & M. Co., No. 5, 5 cents per share; Jan. 18.

Alaska Treadwell M. Co., 37½ cents per share, $75,000; payable Jan. 28.

Homestake M. Co., South Dakota, 25 cents per share; payable Jan. 25.

Fern Gold M. & M. Co., B. C., 5%; payable Jan. 24.

Alaska-Mexican M. Co., Alaska, 10c per share, $18,000; payable Jan. 28.

Boston & Montana M. Co., Montana, $3 per share; payable Feb. 20.

Recent California Mining Incorporations.

Sheep Trail Con. M. Co., San Francisco; capital stock, $2,500,000; subscribed, $125; W. Bowers, T. Cole, W. Bannan, H. G. Hinckley, R. R. Grayson.

Minnie Con. M. Co., San Francisco; capital stock, $2,500,000; subscribed, $125; same directors.

Santa Teresa Quicksilver M. & D. Co., San Jose; capital stock, $500,000; subscribed, $300,000; H. V. Morehouse, E. A. Hazen, J. B. Kerwin, F. J. Hambly, F. Fisher.

French Gulch G. D. Co., Pasadena; capital stock, $1,000,000; subscribed, $960,000; W. H. Barry, J. Hickler, A. Prenzlauer, W. G. Campbell, S. W. Stone.

Lone Star M. Co., Ontario; capital stock, $1,000,000; to work the Lone Star and Yankee Doodle mines.

North American River M. Co., Los Angeles; capital stock $100,000; subscribed $37,600; C. G. Garrison, H. C. Wood; J. W. A. Off, M. E. C. Munday, J. J. Everharty, J. W. Montague, A. H. Cargill.

French Gulch Gold Dredging Co., Los Angeles; capital stock $1,000,000; subscribed $960,100; W. H Barry, J. Hickler, A. Prenzlauer, S. W. Stone, W. G. Campbell.

Spanish Bar G. M. Co., San Francisco; capital stock $50,000; subscribed $250; J. Hey, H. J. Grauerholz, J. Daisley, J. Klein, W. T. Robinson.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JAN. 11, 1897.

597,252.—THRASHER FEEDER — F. H. Ackerman, Shedds, Or.

597,257.—FRUIT DRIER—A. H. Blackburn, Petaluma, Cal.

597,101.—WRENCH—F. O. Collins, Vancouver, Wash.

597,175.—ANTI-FRICTION BEARING—J. R. Coryelle, S. F.

597,316.—WELL BORER—G. W. Durbrow, Salton, Cal.

597,273.—APPARATUS FOR RAISING LIQUIDS — R. W. Elliott, Brentwood, Cal.

597,237 —GATE—L. M. Hawes, Sacramento, Cal.

596,998.—BICYCLE CANTEEN—Hawkins & Gardner, Jerome, A. T.

597,166 —COMPASS—Heinrich & Wood, S. F.

597,287.—BICYCLE ATTACHMENT—F. P. Hurst, Aurora, Or.

597,167.—VEHICLE JACK—J. F. Killian, Stockton, Cal.

597,116.—TANK—A. W. Krause, Los Angeles, Cal.

597,241.—SCREEN FOR DITCHES—N. Lamb, Yreka, Cal.

597,295.—PENCIL HOLDER—O. R. Pihl, Portland, Or.

597,301.—CHANGE MAKING DEVICE—A. A. Smith, Aberdeen, Wash.

597,336.—HEAD REST—Nellie R. Stone, Bryanmawr, Cal.

597,210.—PEANUT HEATER — T. M. Walker, Portland, Or.

28,159.—DESIGN BEARING BRACKET—R. H. Postlethwaite, S. F.

28,160.—DESIGN BEARING BRACKET—R. H. Postlethwaite, S. F.

28,161.—DESIGN BEARING BRACKET—R. H. Postlethwaite, S. F.

28,153 —BICYCLE CARRIER—R. G. Woodward, Alameda, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CHLORIDIZING SILVER ORES.—Ernst Heiligendorfer, Canelas, Estado de Durango, Mexico. No. 597,238. Dated Jan. 11, 1898. This invention relates to a process for chloridizing silver ores so that a much larger quantity of the precious metals can be saved, and the objections to a combination of chlorination and amalgamation and those attendant upon what is known as a chloridizing roasting process are overcome. It consists essentially in subjecting the ore, either raw or oxidized, to the action of copper chloride in conjunction with chloride of sodium under certain conditions which will produce the reactions with the ores treated, which is especially advantageous with rebellious ores.

SELF-CLEANING SCREEN FOR DITCHES.—N. Lamb, Yreka, Cal. No. 597,241. Dated Jan. 11, 1898. The object of this invention is to provide an automatically operating device by which ditches may be cleared of chips and other refuse which float in the ditches, and also to prevent fish from entering the ditches where the same water is employed in pisciculture. This invention consists essentially of a series of vertical bars or teeth fixed at the lower ends to a horizontal rod and a series of curved teeth fixed spirally upon a revolving shaft, so that these teeth will pass between the vertical bars and lift up any material which may be flowing through the ditch and arrive at these bars. The material is thrown out at one side through an embrasure, where it falls upon the ground or into a suitable receptacle. The revolving shaft carrying spirally arranged teeth is rotated by means of a water-wheel, journaled a little distance therefrom, so that the current of water in the ditch will turn this wheel. A belt or band from the water-wheel shaft to the shaft of the spiral arms will turn the latter. The vertical bars are sufficiently near together to prevent the refuse passing between, and will also prevent young fish which may have escaped from their nurseries from passing, and the revolving arms passing between these vertical bars will lift anything which arrives, and, by reason of their spiral arrangement, discharge it to one side. In the case of fish, they may be delivered into a receiver containing water, so that they can be preserved alive.

SUBTERRANEAN ELECTRIC CONDUIT.—Wm. D. M. Howard, San Francisco, Cal. No. 596,812. Dated January 4, 1898. This invention relates to a means for transmitting and supplying an electric current to movable objects, and is more especially designed to provide a subterranean electric conduit within which the trolley wires, rods or tracks are suspended, insulated, and protected from the action of moisture, the tendency to leakage, and induced currects. The object of this invention is to transmit underground electric currents from conducting or trolley wires to a moving object with safety, economy and durability, both mechanically and electrically, thus conveying a current of high electrical efficiency at a small cost of maintenance, and avoiding the use of the unsightly poles and naked wires employed in ordinary trolley systems, together with the danger arising from such wires on account of the necessary high voltage of the current carried by them. The invention is especially adaptable to the transmission of an electric current to street cars for the purpose of propelling them. The conduit consists of two concentric tubes made of iron or other suitable material, the outer tube enclosing the inner one, which is held in position by iron columns or standards centrally fixed in the bottom of the outer tube and having the inner tube bolted or otherwise secured upon the inner ends of the standards. The outer tube has a longitudinal slot made in the upper part of its periphery, forming a continuous channel through which connection is made from the car to the interior of the tube. The interior tube is left open at the bottom for about one-fourth the circumference and the edges are turned inwardly to form guide rails for a plow or carrier which is adapted to travel thereon. The electric current is transferred from the trolley wires, which are contained in the inner tube, to the moving object, or the circuit is completed by means of the traveling plow or carrier, the plates forming this carrier projecting downwardly through the opening in the bottom of the inner tube, thence curving around so as to encircle this tube out of contact with it and the outer tube. These plates unite in a shank which passes up through the slot in the outer tube and makes connection with the car. A peculiarly arranged truss frame supports the shank and the connected plows, springs being so arranged that a freedom of movement is allowed when the car passes curves, and the plow is allowed to adjust itself to the curvature of the slot.

AUTOMATIC GATE.—Levi M. Hawes, Sacramento, Cal. No. 597,237. Dated Jan. 11, 1898. This invention relates to improvements in gates of that class which are adapted to be opened and closed by the approaching and receding vehicle. It consists essentially of a fixed post to which the gate is hinged, upper hinge pins bent diagonally having supporting bracket braces, corresponding eyes let into and fixed to the top of the inner ends of the gate, concaved segments fixed to the lower ends of the inner gate stiles and corresponding segments pivoted to the bottom of the fixed post having sockets upon each side of their pivot points adapted to engage the ends of the gate stile segments, so that the gate is retained in a closed position when the turnable segments are in their normal position, and is tilted so as to swing when the the segments are turned to an angle.

New York Silver Exports for 1897.

The total exports of silver from the port of New York to all countries during the year 1897 were as follows:

	Ounces.	*Value.*
January	5,443,300	$3,528,470 00
February	5,451,000	3,527,991 75
March	6,596,910	4,168,041 30
April	6,322,000	3,919,640 00
May	5,988,000	3,798,572 50
June	6,724,000	4,038,288 75
July	6,595,950	3,932,135 50
August	6,450,280	3,475,007 18
September	5,958,950	3,292,607 00
October	5,578,350	3,215,999 50
November	5,453,750	3,172,556 25
December	7,628,570	4,414,767 25

This

Three-Stamp Iron Frame Battery

WAS MADE BY THE

UNION IRON WORKS

FOR THE

NEVADA METALLURGICAL WORKS.

The stamps weigh 350 lbs.

The total weight of the battery is 5000 lbs.

The weight of the heaviest piece is 1300 lbs.

Capacity, five tons per day.

The COLORADO IRON WORKS CO., Denver, Colo.,

ENGINEERS AND MANUFACTURERS,

Beg to draw your attention to the introduction of the . . .

FINLAYSON PATENT WIRE ROPE TRAMWAY.

It is of the double rope pattern and the newest and best thing in its line ever placed on the market. The automatic features, simplicity of construction, ease of running and economy in operation places the

Finlayson Tramway

far ahead of all other systems of aerial ropeways. It is unsurpassed in tonnage capacity. It is on the principle of "You push the button and the machine does the rest." If interested send for special catalogue.

Our Line of Manufactures includes all kinds of Modern Equipments for the Successful Milling and Smelting of Metalliferous Ores. Special Catalogues on Application.

CALIFORNIA ELECTRICAL WORKS.

6x8 BOLTHOFF COMBINED NOISELESS GEAR AND FRICTION HOIST.—Pat. Oct. 6, 1896.

Men cling to what they see through, like an insect to a pane of glass.—*Geo. Francis Train.*

Perhaps this Accounts for the Great Popularity of the

Bolthoff Combined Noiseless Gear and Friction Hoist.

IT HAS AN OPEN GEAR. :: YOU CAN SEE THROUGH THAT.

It is extensively used, and universally recommended. Any one can see that theoretically it is correct in design and that mechanically it is the strongest, most desirable, best finished.

THE GREAT MINING FAIR

WILL OPEN

Saturday Evening, January 29, 1898,

AND CONTINUE FOR FIVE WEEKS,

AT THE MECHANICS' PAVILION, SAN FRANCISCO.

The Fair will contain practical exhibits and demonstrations of quartz, placer and all other methods of mining, and mining machinery. Complete working plans of the North Bloomfield mill will be in operation on a large scale.

In connection with the Fair there will be a complete Klondike outfitting exhibition, together with Klondike cooking lectures and practical demonstrations of packing supplies over the trai s by horses, burros and men; also the methods of transporting these supplies across the lakes and down the Yukon river to Dawson.

For information, apply to the Secretary, No. 31 Post Street, San Francisco, Cal.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

611 and 613 Front St., San Francisco, Cal.

Pacific Placer Machine.

Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our larger Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb., 400 lb., 550 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

Assaying Gold
.....AND.....
Silver Ores.

A Standard Work.

THIRD EDITION JUST OUT.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay: Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1895. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 20, 1898.

Jobbers report business quite satisfactory and considerably larger in volume than the corresponding month in 1897. The outlook is of the most promising character for a year of general prosperity with the trade, manufacturers and all business men in general. Rains the past week have improved crops still more, and, with the usual spring rains, California will have the largest grain crop for several years past. This will be of particular advantage owing to Australia's wheat crop being poor, necessitating importing from us by that colony so as to supply her wants. A poor crop there also means more ships to come to this port with coal so as to get cargoes of wheat to England. The rush of gold seekers to the Klondike has set in and promises to increase as the season advances. This is beginning to affect trade, as the demand for several lines of goods is enlarging. It is stated that more California products have been bought already for shipment there within the next three months than have been bought altogether for three years past. This will help us quite materially, Iron workers state that the outlook for business was never before so bright, and they also say that fairly good profits seem assured.

The local money market is inactive, with the supply of funds in bank showing a decided increase. It is safe to say that the banks never before held so much money, although considerable is held at the East. Gilt-edge security and good two-name paper are scarce, and persons having them have no difficulty in securing special rates of discount. The disbursements in this city in the current month are very heavy. The greater portion of it is going back into bank, although there is quite a proportion seeking investment. Savings banks are said to have trouble in placing surplus funds on security called for by law, owing to the call for accommodation being light. The East reports growing ease in the money markets, which is favorably affecting the speculative markets there. There is considerable loaning at New York on sterling. This shows that this country is fast assuming an important position in the financial world so far as loaning money is concerned.

New York Silver Prices.

NEW YORK, Jan. 20. — Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	26	58½
Saturday	26¾	57⅞
Monday	26⅝	57⅛
Tuesday	26⅝	57¼
Wednesday	26⅛	56⅜
Thursday	26¼	56⅞

	Copper.	Lead.	Iron.	Tin.
Fri.	10 85 @11 00	3 67½	10 00@12 25	13 85
Sat.	10 85 @11 00	3 67½	10 00@12 25	13 85
Mon.	10 85 @11 00	3 65	10 00@12 25	13 80
Tue.	10 85 @11 00	3 65	10 00@12 25	13 80
Wed.	10 85 @11 00	3 62½	10 00@12 25	13 80
Thur.	10 90 @11 00	3 62½	10 00@12 25	13 80

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	12½c Prem
New York Telegraphic Transfer	15c Prem
London Bankers' 60 days	$4.83¾
London Merchants	$4.81½
London Sight Bankers	$4.85½
Refined Silver, per oz., 1000 fine	56⅞
Mexican Dollars nominal	47@—

SILVER.—The market at home and abroad has settled to lower prices, although at the close there appears to be a slightly better tone. The decline is doubtless sentimental and owing to reports that India will adopt the gold standard, but advices point to increased money requirements in China, Japan and India, but more especially by the latter, which will call for more silver. There is no doubt that the market is quite sensitive and rises and falls according to the demand. The last steamer hence for China took out $99,000 in bullion for China and $64,000 for Bombay.

MEXICAN DOLLARS.—The market has been fairly steady notwithstanding a lessened call. The last steamer hence for China took out $198,500.

COPPER.—The market has held to fairly firm prices.

Our market is quoted as follows:

Ingot casting, jobbing	—	@13
Ingot " wholesale	—	@12½
Sheet copper	—	@16½
Bolt ¾ and 5-16, 20c; ⅜ and larger, 16½		

TIN.—Imports of ingots aggregated nearly 1400 from Australia the past week. The market for both plate and ingot is easy and buyers of round lots find no difficulty in securing concessions.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@	15
Plate, I C coke, heavy, per box	$4 10@4 25	
" " " light, "	4 00@—	

QUICKSILVER.—The last steamer for Mexico took out 100 flasks. The market is quiet but steady.

LEAD.—The market has shaded off still more at the East, closing barely steady. It is stated that corroders are not buying much, but when they enter as free buyers values will appreciate.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75 @	5 00
Sheet	@	6 50
Pipe	5 30 @	5 80

IRON.—The imports continue fair. The consumption is largely in excess of the corresponding month in 1897. The East reports very active markets, with the outlook pointing to a considerably larger output this year than in 1897, which was the largest on record. This will be due to a larger home consumption and a heavy export movement.

SHOT.—The demand is good at current quotations.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

COAL.—The market is strong, with the tendency for near-by, spot and yard advancing owing to a scarcity of vessels for coal carriage from coast ports—all in service to Alaskan ports.

Receipts of coal for the week ending Tuesday were as follows in tons: Comox 1500, Puget Sound 5840, Departure Bay 2336, Coos Bay 1120; total, 10,796 tons.

COKE.—The market is steady.

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is firm with a good demand ruling.

The market is quoted as follows:

Refined, in carload lots, in barrels	7
Refined, in carload lots in sacks	6¾
Powdered, in car lots	7
Concentrated, "	6½

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

POWDER.—The market is firm at current quotations.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

Chemicals.

There is an improving demand, but as yet it does not make itself felt enough to change the general situation. The East reports a fairly steady market, but no change in prices outside of nitrate of soda, which fluctuates.

CYANIDE OF POTASSIUM.—The market is steady.

Our market is quoted for chemical pure 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1¾c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6½@7c per pound in carboys.

BONEASH.—There is a fair demand.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firmer.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steadier at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA. — The market is steady.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Jan. 20, 1898.

The market has been draggy all week. Prices have not varied much, but the general appearance of the market was made to look as if it would go to pieces at any time. To keep outsiders from buying, points are out, "Don't buy yet, but very soon." If shares are a buy soon, then at the current cheap prices ruling for such as Savage, Union, Mexican, Chollar, Belcher, Crown Point and several others, buyers cannot lose much, if anything, and stand a chance of at least 16 to 1 of making "quite a little killing" before spring passes. The writer has been commenting on the mining share market for over twelve years, and he has yet to see a spring pass that prices do not move up from three to fully ten times, and some seasons even more, than the low prices at which sales were made in January. It is quite safe that the coming spring will be no exception, notwithstanding the reports put out that there is no ore, and deep mining must be done so as to revive the Comstock. Active exploiting work is being done in several of the Comstock mines, while preparatory work is being done in some of the others for active exploiting. This work, if all confirmed information is not misleading, will unquestionably result in striking ore. Aside from the work on the Comstock, that on the Brunswick grows in interest as the work in several advances in the direction stated by the two experts that will result in striking ore that will pay well. It is expected that it will take several weeks yet before the objective point is reached. This makes the shares of the mines, Occidental, Potosi, Chollar, Savage, Gould & Curry, Best & Belcher and Con. Virginia, located on that lode a good gamble—particularly the lower priced ones. Inside points are still out that Con. Virginia must sell lower before it is safe for outsiders to buy. If this keeps the latter from buying, then who is taking the shares sold on the two exchanges? Probably not within the history of speculation in mining shares has a year opened so favorable as 1898 for promoting a big bull campaign. There is a plethora of funds at every financial center in the United States, notwithstanding over $60,000,000 have been loaned at New York on sterling bills, and this money can be drawn from England when required. Mining is attracting attention at home and abroad and money is forthcoming in almost any quantity desired to invest in any kind of proposition which promises a fair return. Reports from the Klondike confirmatory of rich gold mines are increasing the desire to invest in mining speculation on this coast and it would not take much to create a mining share craze.

The news from the Comstock mines is practically about the same as reported last week. The important work heretofore noted in several is being pushed ahead, and as each day passes, brings them nearer the objective point; this is particularly the case in Sierra Nevada. While the street looks for the downward continuation of the ore to be cut by the Riley tunnel this month, our advices do not warrant expecting it before some time in February. The shorter time has been put out by the mining share manipulator for the purpose of having reports circulated that "it is a failure," so as to depress the market. In Utah they are still driving ahead in north drift with formation of a generally favorable character. In Sierra Nevada they have about finished repairing the north drift on the Layton tunnel. They are again driving ahead in the Riley tunnel. On the 900-foot Union shaft level they have advanced west crossdrift No. 5 about 100 feet. It is likely they will stop this crossdrift just in time not to strike the west lode. In Union they are still drifting ahead the No. 2 east crossdrift from raise above the 900-foot level. In Mexican they are going east on the 1000 foot level in the north drift from the Ophir shaft station. No change is reported in the general formation. It is in over 625 feet. The west crossdrift in Ophir on the 1000-foot level is in about 800 feet. A crossdrift is being run also on the Central Tunnel level. Work in Con. Virginia is reported to be confined still to the 1550-foot, 1650-foot and 1750-foot levels.

So far as the official letter reports, there has not been any change in the character of the work on the different levels, neither has there been any change in the formation. A west crossdrift from an upraise above the 1650-foot level is passing through streaks of rich ore which goes over $50 to the ton. The west crossdrift on the 175-foot level in Andes is in porphyry and quartz. It is in over 30 feet. They have resumed work in the Best & Belcher and Gould & Curry joint east crossdrift on the 800-foot Bonner shaft level. In Savage the work and formation is about the same as reported last week. No work in Hale & Norcross. They have put in two sets of timbers in the Chollar mine incline above the 1100-foot level. They are still repairing the main airway on the 1000-foot level.

In Potosi on the tunnel level the joint Potosi-Bullion south drift is being driven ahead. They are also going east from the sixth floor of the south upraise, tunnel level. They are still repairing and retimbering the old Crœsus shaft in the Bullion. In Alpha they are repairing the north drift on the 500-foot level and also putting in drain pipes. In Con. Imperial they continue to drive the long west crossdrift ahead. The flow of water continues strong. From Confidence, Challenge and Yellow Jacket nothing new comes to hand. No work is reported in Kentuck. There is nothing new reported in the letters from Crown Point, Belcher, Seg. Belcher and Overman. The work is practically the same as reported last week. They ought to strike the ore soon that they are running for in Justice.

Interest continues to be largely centered on the Brunswick lode, and if expectations are realized operators will come to the front as buyers of the shares. The management of Occidental have the courage of their convictions, for they continue to buy the shares, believing that the prospects warrant them to look for an important strike of ore. The west crossdrift in this mine on the 500-foot level is in over 20 feet. On the 650-foot and 750-foot levels no change is reported in the work. The main south drift of the 750-foot level is skirting the footwall. At last advices it was in fair grade ore. In Potosi they have made air connection between 500-foot and 600-foot, and commenced work in the south drift on the former level. On the 500-foot level west crossdrift No. 3 is being run ahead. In Chollar repair work is engaging about all their attention. It will be through soon. So far as official letters go there is no change in the work in Savage or in the joint work of Con. Virginia, Best & Belcher and Gould & Curry.

The following illustrates the changes of the week:

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,
330 Market Street, San Francisco, Cal.

Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco. California. location of works, Sunny Hill, Shasta County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 3rd day of January, 1898, an assessment (No. 12) of 9 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

THE SAVAGE MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 6th day of January, 1898, an assessment (No. 34) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. B. HOLMES, Secretary.

Office—Room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

FALL RIVER CONSOLIDATED GOLD QUARTZ Company.—Location of principal place of business, San Francisco, California; location of works, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 15th day of January, 1898, an assessment (No. 11) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 313-315 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on THURSDAY, the 21st day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. LORSBACH, Secretary.

Office—313-315 Front street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of January, 1898, an assessment (No. 9) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of February, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

DELINQUENT SALE NOTICE.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Humboldt County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 29th day of November, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Harvey M Binckley	2	1	5 00
Alice E. Binckley	20	4	20 00
Alice E. Binckley	23	20	100 00
Alice E. Binckley	24	20	100 00
Alice E. Binckley	25	20	100 00
Alice E. Binckley	26	20	100 00
Alice E. Binckley	39	1	5 00
Alice E. Binckley	40	2	10 00
Caroline S. Townsend	18	20	100 00

And in accordance with law, and an order from the Board of Directors, made on the 29th day of November, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the corporation, 125 Beale street, San Francisco, California, on SATURDAY, the 29th day of January, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Mill Construction, Assaying, Blow-Pipe Analysis, Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application

The College has also Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.

By P. M. Randall.....$2 00

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....60 cts

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. & Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

A Model California Stamp Mill.

Elsewhere in this issue appear correct portrayals of early mining appliances in California. The engravings are mostly reproduced from the original wood cuts made for the MINING AND SCIENTIFIC PRESS by Nahl and other pioneer artists thirty-five years ago. By way of contrast between the past and the present it was desired to place on this page a California stamp mill of '98, and through the courtesy of the Union Iron Works a large perspective view, drawn to the scale, was made especially for this issue, of which the above is a reduced engraving. It speaks for itself and requires no note or comment. It is a correct portraiture of a model California 10-stamp mill, with direct electrical connection, etc., and is believed to be the embodiment of present improvement on the first stamp mill in this State, which was built in the winter of '50–'51, and of which considerable is said elsewhere.

It is a long step from the ancient arrastra portrayed on page 114 to the modern stamp mill, and the progress is largely the result of accumulated practical experience on the part of California builders and designers of mills, and California millmen in the handling of the various gold ores. Time was when a yield of 40 per cent was a good average—these figures being now more than doubled in daily results. Many old miners recollect when anything less than $20 ore could not be worked at a profit. California gold ore is being to-day worked at a total cost of 60 cents per ton for mining and milling.

The tendency in modern California stamp mill practice is to run at what is considered a high rate of speed, making 100 drops per minute, and increasing the weight of the stamp, which sometimes weighs as high as 1000 and even 1400 pounds, the height of drop varying from 4 inches to 12 inches above the top of the die. The chief difference between the California and Colorado stamp mills is in the weight of the stamps and their speed. An average Colorado stamp will weigh 550 pounds, with thirty drops per minute, of from 6 to 20 inches. The average duty of the Colorado stamp is one ton per twenty-four hours; in California, with ore of like hardness, two and one-half to four. The ore is dissimilar, and what is good practice in Colorado would be poor in California, and vice versa. As a rule, California ore does not require to be so finely pulverized as that of Colorado. Science may be defined as organized knowledge, and art as the application of science; and in this regard both California and Colorado methods may be considered as scientific evolutions from knowledge bought by costly experience. It may further be said in this regard that the highest percentage of gold saved from mill plates does not always indicate the highest financial prosperity. If 85 per cent of the gold can be saved at a not excessive cost, where the saving of an additional 5 per cent would cost largely more than that extra 5 per cent would amount to as a commercial proposition, it would not be considered good mill practice to attempt the saving of the extra 5 per cent; though, as a general thing, the higher percentage saved the better the ore pays.

But a word, however, is to be said in this short notice regarding the amalgamating tables. It will be noticed in the engraving that they are wider than the short apron and narrow sluice plate of the old California mill, giving better service and being deemed a great improvement on former practices.

SO FAR as known, the South African gold yield for '97 was $55,000,000, of which over $51,000,000 was from the Witwatersrand district.

THE 1897 production of gold in California is estimated to aggregate $18,500,000. To date California has produced over $1,300,000,000 gold.

DURING '97 exports of silver to the Orient from London aggregated $37,255,807; from New York City to all countries, $44,911,966; from San Francisco to the Orient, $11,156,202.

TO THOSE who are not regular readers of this paper it is due to say that many of the usual features are necessarily omitted in this issue to make room for articles of general and timely interest.

MR. B. M. NEWCOMB, general superintendent of three California quicksilver properties, states that during the calendar year 1897 the Etna Con., Napa county, Cal., produced 3600 flasks of 76½ pounds each, the Napa Con. 6400 flasks, and the New Idria, San Benito county, 3605.

THE greatest depth ever attained on the Comstock, Nevada, lode was in the Union Con. in the north end—3350 feet—just fifteen years ago, when the clamor for dividends caused the mines to be allowed to fill with water. Many miners argue with considerable show of reason that to unwater and push deeper would unearth a third bonanza.

GOLD AND COPPER occupy a present unique position in mining products. Copper is the only metal whose price has materially advanced in recent years. Gold is the one product of all others that is above and beyond the ordinary laws of supply and demand. In the case of gold the buyer seeks the seller, the market is unlimited at a fixed price, with no competition and transportation charges at the minimum.

A NOTICEABLE feature in California mining in '97 was the increased production of copper, due largely to the steady output of the Mountain Copper Co., which is now credited with a very large daily output of matte from the smelters which goes from Keswick to Galveston, Texas, by rail, thence by sea to Newport News, Virginia, where it is again transferred by smaller vessel to the company's refineries at Elizabeth, N. J.

The Semi-Centennial Celebration.

Never in the history of any American commonwealth was there a more hearty, widespread and spontaneous accord in the celebration of an important event than that in response to the modest little suggestion in this paper last August that the fiftieth anniversary of the discovery of gold in California could and should be fittingly celebrated. California has set so high a standard for celebrations, and San Francisco is so noted for its efforts in that regard, that to set a new record was more than ordinarily difficult. It is with pleasure the fact is here recorded that the celebration of the epoch—for epoch it is—has been fully commensurate with all expectations. What the landing of the Pilgrims was to the North Atlantic coast, or the coming of the Cavaliers to the South Atlantic coast, the rush of '49 was to this coast. This last event practically gave half a continent to the United States, and did more than any one thing since the Revolutionary War toward making this the foremost nation of the earth. The thought of what California would be today had no gold been discovered here, in contrast to what the State is and what it will be, sufficiently emphasizes this point so far as this coast is concerned. The knowledge of the great impetus given to populating the region west of the Rocky mountains by the discovery which gave a billion dollars in gold to the nation when it needed it the most demonstrates the historic magnitude of the discovery.

The fitness of celebrating such a great event so appealed to the good sense of everybody that it required no argument. The only question was, "How shall it best be done?" and the answer culminated this week in a magnificent commemoration. The beginning was the great procession of the 24th inst., which was nearly three hours in passing a given point, the cost of each minute of those three hours being over one thousand dollars. The preceding sentence partially illustrates the scope of the parade. To fully realize what that parade meant, a sight of it alone was necessary to the thoughtful. The parade itself was a record maker and a record breaker; it exemplified the entire history of California; everything in it was typically Californian, and the history of fifty years was written in its lines. Wherever the eye turned history was seen moving in living form. There rode four of the men who gathered round Marshall on that historic morning when he picked up the first gold nugget at Sutter's Mill; there rode such men as General Bidwell, who were here in 1841; there rode the pioneers of those earlier years, the men who could with truth say, "All of which I saw, and part of which I was;" there rode aged women, who were belles "before the Gringo came." Every department of California mining, mercantile, mechanical, manufacturing and social life was represented; turning from the men with whom the shadows of life slope eastward, the eye fell upon thousands and thousands of native sons and daughters, marching in solid array; and to fittingly round out the stirring scene, came, with steady step, thousands of boys and girls from the public schools of California. The music, banners and floats; the thousands of United States military troops and State militia; the allegorical representations—all these have been duly described in the daily press. The effect of the whole thing was something sublime—far more than the ordinary parade, gorgeous as the ordinary parade may be made. It was symbolical of California everywhere; California's golden colors, showing the whole gamut of human life and emotion, played in the yellow sunlight of that January day. It was something to be long remembered.

In the subsequent literary exercises of the day, Niles Searles, "the old man eloquent," and others, did full justice to the great theme.

The entire week has been given up to festivities of various sorts, and to-night the Golden Jubilee Mining Fair is to be opened with elaborate ceremony. This Mining Fair is deserving of a visit from every one at all interested in gold mining in any of its forms; and any one contemplating having anything to do with mining for gold within the sunny limits of this commonwealth, or elsewhere throughout the world, will find it a school of instruction during the next five weeks.

The occasion throughout has been a great one and has been greatly commemorated.

THOS. A. EDISON is now credited by the daily press with the assertion that his magnetic process of working iron ore in New Jersey justifies him in extension of his achievements to working gold mines. In an alleged interview he is quoted as saying that "by a new process which I have invented I can profitably mine ore which contains as little as $1.25 gold to the ton, and I prefer low to high grade ores. In mining gold I shall employ substantially the same process that I am now using for mining iron. When I speak of mining it is not in the sense that the term is generally used. The day of the old-fashioned miner—the man who digs the ground with a pick—is past so far as I am concerned. I have no use for him. My mining is all done by machinery, and it does the work after a fashion that is practically automatic." So much is published in sensational dailies as being said and sung by Mr. Edison and other distinguished men that the appearance of an "interview" needs more than ordinary newspaper statement to carry credence. It is possible Mr. E. may have said something like the quotation, but not probable. Mr. E. or anybody else would find considerable difficulty in gold mining to dispense with "the man who digs the ground with a pick." He is also credited with saying that "at present it is impossible to profitably operate gold ore going less than $1.25 per ton," which is not in consonance with the facts. At various places on this coast gold ore yielding less than $1.25 per ton has been and is being profitably treated.

THE 1960th issue of the MINING AND SCIENTIFIC PRESS is intended to commemorate the fiftieth anniversary of the discovery of gold by James W. Marshall in this State at Coloma, El Dorado county, on the 19th of January, 1848. Most of its contents is naturally of a reminiscent nature, though, like the State and the industry it represents, the MINING AND SCIENTIFIC PRESS does not rest content with the recital of what has been done. Such crude engravings as those on pages 107 and 114, which were fine in their day, and which are reproduced from the pages of this paper of thirty years ago, are in marked contrast to the finer work of the artist by the methods of '98, as shown on pages 103 and 130; and the trade announcements are of themselves a sufficient epitome of up-to-date methods of scientific mining. A very large edition has been printed, and it is believed that this issue will be referred to for the next half century as authoritative illustration of what has been done during the eventful fifty years since the finding of the historic nugget changed the history of this entire west half of America.

THE estimated value of the silver mined in Montana in '97 is $20 550,000 at its coinage value, as compared with $20,324,887 for '96. Silver, under its present conditions, must continue to be a by-product, for the most part. An increase in the tonnage of the Butte copper mines will increase the production of silver, while a decrease in the number of tons mined from the copper producers means a decrease in the production of silver. While less lead was produced in Montana this year than last, its value was greater, owing to higher prices. The value of the estimated production of lead mined in Montana during '97 is $750,000.

NEVADA papers are saying some bitter things about the Peck Bros., who have been operating a new process for treating tailings. At the time the process was introduced an effort to secure some technical data for publication herein was met by the statement that the process was "a secret one." The results do not seem to share in that attribute.

THE Czar's big Siberian road will cost $200,000,000. When it is completed it will be possible to go around the world in thirty-three days. From New York to Bremen seven days; Bremen to St. Petersburg, one and a half days; St. Petersburg to Vladivostock, ten days; Vladivostock to San Francisco, ten days; to New York, four and a half days.

The Mother Lode of California.

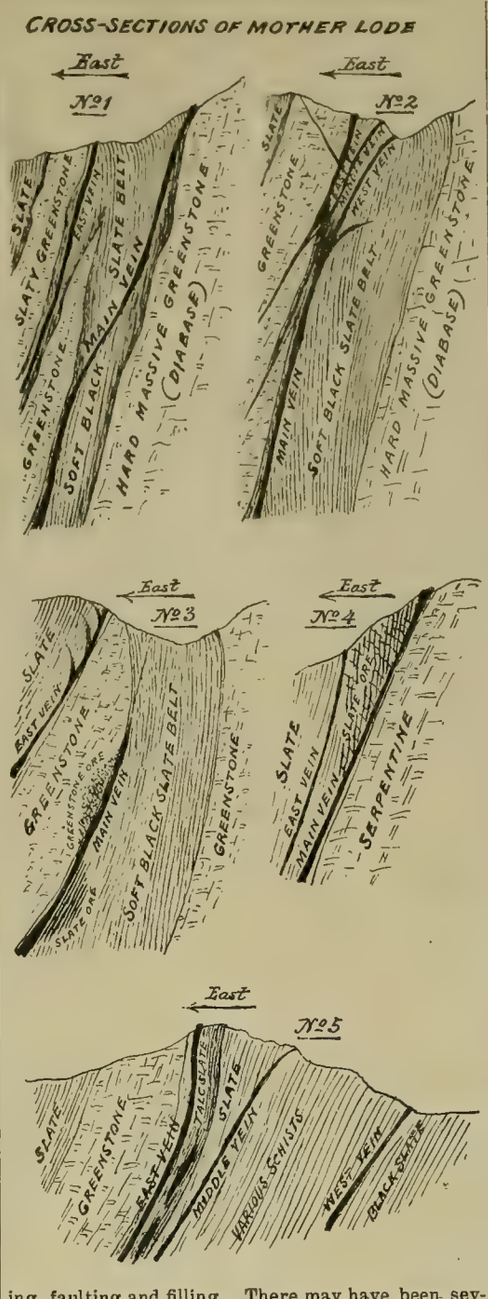
Written for the MINING AND SCIENTIFIC PRESS by
ROSS E. BROWNE, Mining Engineer.

The so-called "auriferous slate belt" of California, in which the Mother Lode occurs, begins south of Mariposa county and extends northwesterly along the western flank of the Sierra Nevada to the north line of Plumas county, and doubtless further, but is thence covered with vast sheets of barren lava. As described, it is about 250 miles long and twenty to seventy miles wide, and forms about one-third of the precious mineral-bearing area of the State—so far the most productive part.

This belt is composed of a more or less conformable series of highly tilted slates and metamorphic schists, with intervening layers and occasional intrusions of igneous rocks. The general strike of the strata is northwesterly—parallel with the axis of the Sierra—and the dip very steep to the northeast. The cleavage of the slates corresponds practically with the tilted bedding planes.

Within this area are vast accumulations of auriferous gravels, and a countless number of gold-bearing quartz veins, commonly following the strike and dip of the strata, occasionally crossing them. Only a small per cent of the great number of these veins contain gold enough to pay the expense of mining and milling, though they all contribute value to the gravels. However, there are in the belt several zones and irregular areas, within the limits of which the veins contain more than the average amount of gold and have produced many valuable mines. The most important of these better mineralized areas are the Grass Valley and Nevada City district, the so-called Mother Lode belt, and the east belt of Tuolumne and neighboring counties.

The Lode.—The Mother Lode is centrally located in the "auriferous slate belt," and is remarkable for its great length and strength, extending over 100 miles in a northwesterly direction through Mariposa, Tuolumne, Calaveras, Amador and El Dorado counties. It is a continuous series of parallel quartz veins, following more or less persistently a narrow belt of soft black slate. This belt is bounded laterally by harder slates, greenstones (diabase) and nearly allied schists (amphibolite), serpentines and occasionally by masses of intrusive granitic rocks. The strike of the strata is between north and west, while the dip varies from 60° to the northeast to 80° to the southwest, but is most commonly 70° or 80° to the northeast. Near to the surface the tilted strata are usually bent downward with the slope of the hill. In some of the sections they stand vertical or even dip to the west.



The veins follow the slates very closely in strike, but cut the strata at acute angles on the dip, being 10° or 15° flatter. The average dip is between 50° and 70° to the northeast. The veins are generally in the black slate either wholly or at one of its contacts with greenstone or serpentine, but occasionally they pass, for short distances, entirely into the amphibolite schist or slaty portions of the greenstone.

Cross Sections.—Several typical cross sections of the lode are herewith presented.

Continuity.—The actual continuity of a single vein throughout the entire 100 miles length is not apparent, and it is not believed that such will ever be definitely established. With more development it is probable that continuous veins will be traced through Tuolumne and Amador counties where the lode is well confined within narrow limits, but there are difficulties in the way of connecting these through the central part of Calaveras county where the branches are widely scattered.

Probably there occurred, at some time while the mountain masses of the Sierra were uplifting and readjusting, one great break and fault following the length of the soft slate belt as a line of least resistance. This break is doubtless represented in some sections by one or two large fissures only and in others by a great number of small fissures following the strata, overlapping and interconnecting somewhat obscurely.

The filling of such fissures would form one great vein with a system of interconnected branches. But there is no authority for assuming that the various veins of the belt represent but one period of fissuring, faulting and filling. There may have been several distinct periods, and upon this depend some important questions of identity and the propriety of applying the term "Mother Lode" to the main vein as the feeder of all others of the section.

The Quartz Bodies.—The main vein always carries a strong gouge either on the foot or hanging wall. The quartz bodies forming the ore shoots occur in lenticular masses from a few inches to fifty feet or more in thickness, from one hundred to one thousand feet long in strike and often of greater extent in the direction of the dip. They are irregularly distributed along the line of the great fissure. Between these bodies the line of fissure is marked by gouge matter, smooth walls, etc., and is easily followed. The walls are more or less ribbed and polished—evidences of motion.

A green mineral, known as mariposite, colors great masses of the veins, and characterizes a large portion of the lode, notably in Mariposa, Tuolumne and the south end of Calaveras counties, to some extent in El Dorado, but not to any important extent in Amador.

Concerning the trend of the ore shoots in depth, various local rules are put forward, but all that may be said in a general way is that they go down on the dip and are longer in that direction than with the strike, but are otherwise quite irregular in outline.

The Ores.—The ore bodies are mainly quartz, more or less mixed with stringers of slate or bunches of greenstone. They are at times partly colored with mariposite, and usually include some seams of calcspar.

The ores contain free gold and gold-bearing sulphurets—mostly iron pyrites, with more or less copper and arsenical pyrites, and occasionally galena and zincblende. In large quantities the ores carry from $1 to $25 per ton in free gold, and from 1 to 4 per cent of sulphurets valued at $40 to $125 per ton. Ores containing less than $7 per ton are considered low grade, $7 to $12 medium grade, above $12 high grade. The average pay ores contain 1 or 2 per cent of sulphurets worth $75 to $100 per ton. Rich sulphurets generally mean good values in free gold—poor sulphurets the contrary.

There are occasional occurrences of rich telluride ores, notably in the northern part of Tuolumne and southern part of Calaveras counties, but they seldom form any important part of the ore output of the mine.

The gold is mostly fine and pretty well distributed along the length of the ore shoot. There is apt to be quite as wide a variation in values across the thickness of the vein as along the length of the shoot.

Coarse gold is generally exceptional, but has been found in considerable quantities in some of the sections—for example in the southern part of Calaveras county, where more than $1,000,000 worth of coarse gold is said to have been obtained by the early miners.

So-called ribbon rock is characteristic of a great part of the lode. It is quartz ore with a banded structure, due to many black slaty seams parallel to the walls of the vein. The structure is more pronounced near to one of the walls, usually the foot. In well mineralized sections of the lode the ribbon rock contains the better values—the slaty seams being rich. It occurs as well, however, in poorly mineralized sections, where it contains little value, of course.

Quartz often extends from the vein irregularly into more or less shattered portions of the wall rocks—in large part by substitution, it is believed. This quartz occasionally carries sufficient valuable mineral with it to form considerable bodies of profitable ore, usually low-grade, however.

In some sections of the lode there are extensive bodies of "mineralized" talcose slates, directly associated with one of the main fissures. These sometimes contain several dollars per ton in fine gold and have been mined to some extent near to the surface.

The hanging-wall slates, near to the surface, are in places fissured and traversed by a great number of small seams of quartz, carrying coarse gold. Many such bodies have been mined by open-cut work, but peter out or become unprofitable in depth.

At the northerly end of El Dorado county, where the mother lode belt divides and apparently scatters, there are a number of so-called seam diggings—occurrences somewhat similar to the above, but not directly connected with a large fissure, at least not apparently. These are belts of soft, finely laminated slate, somewhat talcose, seamed with innumerable veinlets and stringers of quartz, and containing considerable coarse gold. Most of the seams cut the laminæ at very acute angles, while others are nearly at right angles. These belts are 100 or 200 feet wide and have been mined to a considerable extent by open-cut work, especially at the Georgia Slide and Spanish Dry Diggings.

The average thickness of the underground ore bodies, so far mined in the lode proper, has been probably five or six feet, varying from one to fifty or more. The average yield has been about $10 per ton, varying from $3 to $25. But it must be borne in mind that the greater part of the ore has been extracted from the richer sections of the lode. With the new enterprises now under way, and the larger milling capacities, the average yield will doubtless be reduced to $5 or $6 in time.

The Gold Product.—The total product of the lode is difficult to estimate with any satisfactory degree of approximation.

Several of the mines have yielded between $5,000,000 and $12,000,000 each—the Keystone, Old Eureka, Utica, Plymouth Consolidated and Kennedy—several others $2,000,000 or $3,000,000, and a great number between $100,000 and $1,000,000 each.

There is more work done on the lode in Amador than in other counties, and the yield there has been over $35,000,000 and probably less than $50,000,000. The product of the entire lode, exclusive of the pla-

cers partly derived from it, has doubtless been more than $70,000,000, and less than $100,000,000.

For a number of years past the lode has been yielding about a fifth of the State's annual gold product, and its entire yield has been between a quarter and a third of the quartz mining product of the State.

The more productive mines have been very profitable.

Treatment of Ores.—The treatment of the ores is, of course, by simple stamp milling, amalgamation of the free gold, concentration and subsequent chlorination of the sulphurets. The tendency of late has been to use coarser screens and thus increase the capacity of the mill and avoid unnecessary sliming of the sulphurets. Formerly two tons to the stamp per day was deemed a good average; now it is three or four.

The process applied to these ores is cheap and efficient, costing from 50 cents to $1 per ton, and yielding from 90 to 95 per cent of the gold content.

Cost of Production.—The cost of production by the prevailing methods of working is shown by the records of a number of important mines on the lode, which have been continuously operated for the past ten or fifteen years. From these it appears that the average expense, after establishing the plant and sinking the shafts far enough to begin the development and extraction of ore, has been about $5 per ton of ore milled. This includes, besides the cost of immediate mining and milling, the dead work required to keep the ground opened ahead, the minor additions to the plant, the repairs, etc.—it is practically the difference between product and dividend.

The dead work once completed, it has at times been found profitable to break, hoist and mill ores of as low grade as $3 per ton.

Several of the better equipped mines are now operating at a materially less cost—less, it is claimed, than $3 per ton. This may be so, but figures based upon accounts covering short periods should not be too readily adopted as averages.

Reducing the Cost.—The importance of reducing the operating expenses per ton of ore milled is even greater than might at first appear. The quartz bodies of the lode yielding between $2 and $5 per ton are much more numerous and greater in extent than those yielding more than that amount. With the operating expense at $5 per ton there was only a small part of the length of the lode promising an attractive return for the expense of opening, but with figures reduced to $3 the area of vein promising profit is much greater—doubtless several times greater.

In considering how the cost per ton may be reduced, the following approximate subdivision of running expenses is of interest: First, cost of operating the mining plant, including the power supply, labor of topmen, repairs to machinery, etc.—20 or 25% of the total operating expense; second, cost of labor and supplies consumed in making the underground excavations, tramming, etc.—25 or 30%; third, cost of timbering in supporting and maintaining the underground excavations—25 or 30%; fourth, cost of treating the ores, milling and chlorination—15 or 20%; fifth, cost of management, 5%.

It will be seen that the bulk of the expense is connected with the mining, *i. e.*, the work of excavating, protecting the openings and delivering the ores to the surface—the cost of treating the ores is relatively small.

It must be said, furthermore, that the prevailing methods of mining are far less satisfactory than the prevailing methods of treating the ores, and that the improvement of the former offers by far the greater opportunity for important saving.

The methods of opening the mines for deep work, the hoisting capacity of the shafts, and the manner of protecting the openings (the timbering), particularly, call for improvement.

Methods of Opening.—The mines of the lode have generally been opened, and, with few exceptions, are still being operated through inclined shafts closely following the vein. The reasons for this are evident. The ground near to the vein is soft and easily excavated, and good progress in sinking can be made at small first expense. The approximate following of the vein on its dip enables, from the start, frequent inspection and test of the ores as the work progresses.

The typical incline has two hoisting compartments and a ladderway. The first cost in sinking and timbering is from $30 to $50 per running foot, and the progress from 10 to 25 feet per week.

The hoists are small, double-geared, and provided for running both with steam and water power. The water power is generally cheaper, but steam relay is necessary in case of accident to the water supply.

Pine wood is used as fuel, costing $4 to $7 per cord. Water costs 15 or 20 cents per miner's inch per twenty-four hours (15,000 gallons). It is claimed that pine wood at $5 per cord is about as cheap to run the works with as water power under 175 feet fall at a cost of 20 cents per inch.

The rock is hoisted in large self-dumping skips carrying loads of two or three tons.

The amount of water encountered in the lode is small, amounting to a flow of 1 to 10 miner's inches (10 to 100 gallons per minute) in each mine. This is mostly surface water, not extending to very great depth. As a rule, if all the water above the 700 or 800-foot levels is caught up and delivered to the surface, the balance of the ground in depth remains practically dry. This water is generally handled in the same way as the rock, in preference to pumping.

Owing to the soft swelling ground near to the vein, the timbering requires close attention and frequent repairs. The dip of the lode is somewhat irregular, varying occasionally from 45° to 70° in a single section, and in trying to follow it even approximately there occur bends or marked changes in the inclination of the shaft. The ultimate result is great expense of repairs and material reduction of the safe speed of hoisting.

These disadvantages are not felt in the beginning, but invariably become matters of serious concern when considerable depth is attained. After reaching depths of 1500 or 2000 feet, the cost of keeping a single incline in barely passable repair is occasionally as great as $4000 or $5000 per year, and the safe speed of hoisting is lowered to 300 or 400 feet per minute, reducing the capacity to such an extent that there are required two or three such inclines to supply a 60-stamp mill. In fact the limit in depth where low grade ores may no longer be profitably worked is reached long before there appears any serious drawback due to natural causes.

Vertical Shafts.—Messrs. Thomas & McClure of the Gwin mine have made a step in advance. They put down a vertical shaft to tap the vein under the old works at a depth of 1500 feet, and are now supplying a 40 stamp mill with 150 tons of ore per day at less than the usual cost. When their mill is enlarged, they will doubtless reduce the running expense per ton of ore very materially.

The Merced and Oneida companies are also opening their mines with vertical shafts, and it is understood that the Kennedy and Wildman companies are contemplating the sinking of deep vertical shafts to operate through. The Oneida shaft is down nearly 1500 feet and is designed to tap the vein at 1750 feet. It is equipped with a hoist easily capable of supplying an 80-stamp mill with ore from a depth of 2500 feet or more. The works were designed and erected by Mr. H. C. Behr and are the most capacious on the lode.

The advantages of the vertical shaft for deep working are manifest. It is removed from the lode, in firmer rock, is easily kept in repair, and is adapted to rapid hoisting. A single shaft may be made to do the work of several crooked inclines and thus make a great saving in the operating expenses.

It is true that much greater lengths of crosscut are required to reach the vein, and this disadvantage is prohibitive in developing flat veins such as those of Grass Valley and Nevada City with dips of 25° to 45°; but in the case of the Mother Lode, with an average dip of 60° or 70°, it becomes less significant.

The cost of the Gwin shaft is understood to have been not more than that of the average incline—$35 or $40 per foot. The Oneida shaft is larger, in harder rock, and had much more water to contend with; it cost about $65 per foot.

The Oneida shaft was laid out with the length of the collar parallel to the croppings of the vein and the strike of the slates. It was expected that the strata would pitch to the east, but they were found vertical through the depth of the shaft, and the ground was exceedingly difficult to break in consequence. Machine drills could not be used to advantage, it being impracticable to put down machine holes otherwise than parallel with the seams and strata, giving the powder little chance to break and throw the rock. The progress made by hand drilling with three shifts of six men each was forty to eighty feet per month; average sixty. The amount of water handled is from two to ten miners' inches, according to the season. Had the collar of the shaft been laid out to cut across the strike of the slates, better progress would certainly have resulted, and the experience is worth remembering.

It may be said that the incline is the preferable means of prospecting, developing and working the mine to moderate depth, while the vertical shaft is much the better for operations to great depth.

Beginning with a virgin mine on the lode, the start is very properly made with an incline following the vein. After operating to depths of 800 or 1000 feet it is found that the expense of repairs is rapidly growing, while the capacity of the incline is rapidly diminishing. Then is the time to stop and inaugurate a better system of work, if the showing justifies it. But an oversanguine spirit, impatience and improvidence are apt to prevail. If in good ore, it is generally preferred to follow the old system as long as it pays expenses, with the hope of finding something still better. An unfortunate turn destroys confidence and credit, and the mine, which might have paid well under better management, is closed indefinitely. This is doubtless the history of a number of the mines. Some of them were better managed—others have paid notwithstanding bad management—still others never had an attractive showing.

Developments.—In order to illustrate the proportion of the lode already worked, if we should plot it all upon a longitudinal section, it would impress us as insignificant compared with the area still unexplored in depth. The greater part of such area is, of course, likely to be poor, but there are many sections in it attracting test, and some with values practically established.

Twenty or thirty shafts have been sunk on the lode to depths exceeding 1000 feet—two of them exceeding 2000 feet. The developments made have inspired the utmost confidence in the permanency of the main fissure, and its mineralization—in fact, it is commonly asserted that the lode improves with depth, but this claim is doubtless oversanguine.

In Amador county the Kennedy mine, after developing low and medium grade ores down to a depth of 400 or 500 feet, passed through a comparatively barren zone, and at a depth of 900 feet encountered a high-grade ore body extending down 1000 feet farther and yielding several millions of dollars. Quite recently a new body of high-grade ore was opened at a depth of 2200 feet.

The neighboring company, the Argonaut, encouraged by these developments, but with a very poor showing on the surface, put down a deep shaft, and at a depth of 1000 feet made an apparently equally valuable discovery.

The Utica mine, in Calaveras county, proved richer in depth than at the surface; and the same is said of a few others.

But there are several important mines of the lode developed to depths of 1200 or 1500 feet with much poorer results below the 800 or 900-foot levels than above.

All these tests have naturally been made in sections with a good showing on the immediate surface or near at hand.

Chance in Depth.—The facts doubtless warrant the assumption of just as good a chance of discovery at great depth as near to the surface. The chance is certainly favorable in most of the sections which have been good on the surface—depending, of course, to some extent upon local conditions.

There appear excellent reasons for confidence in the main fissure—the lode proper—to greater depth than the miner is likely ever to reach.

Width of Belt.—As already stated, the Mother Lode belt is alternately widespread, containing many parallel veins, and narrowly confined, with only one or two important veins. The width generally recognized as the area within which the main fissure may be sought varies from 100 feet to a mile or two.

The greater number of the more valuable discoveries have been made in the narrower sections thus defined, but several notable exceptions prevent the adoption of a rule. All that may be said properly is that great strength of fissure is one of the important factors in making a great and lasting mine, and is more apt to be found in the better confined than in the widespread section—but the conditions which favor the strongest mineralization are little understood and doubtless complicated.

A Field for Deep Mining.—The rich spots on the surface of the lode, the poor man's diggings, have long since been exhausted, but unfortunately many of the claims awaiting proper test are still held by men unable to open them and unreasonable in their expectations. Such men retard development.

There remain to be tested a number of sections which were good on the surface but became poor at moderate depths, and many more which show only low grade ore on the surface.

On the whole there is an excellent field for deep mining in the better mineralized sections of this Mother Lode, but it is one that should be entered only with large capital and a rational mining spirit.

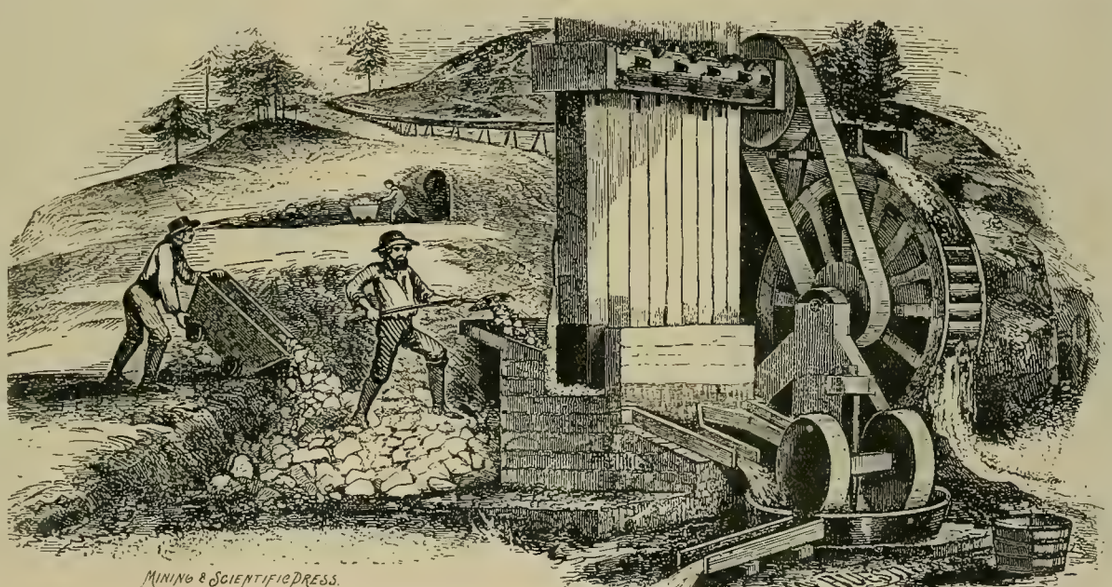
Literature.—The geological features of the lode are best presented by Mr. Fairbanks in the State Mineralogist's Tenth Annual Report, 1890, accompanied by a map showing approximately the distribution of the various enclosing rocks, and the line of most important claims; also by Messrs. Lindgren and Turner in the published atlas sheets of the United States Geological Survey. The latter are considered the most authoritative regarding the surface formation, but the scale is too small to illustrate the location of individual mines.

There is a certain amount of information to be had concerning the mines of the lode in the United States Reports on Mineral Resources, in the various reports of the State Mineralogist, and in the files of the MINING AND SCIENTIFIC PRESS Probably the best information to be had concerning the early workings is in the volume of Mineral Resources of 1868.

It must be said that in view of the importance of the subject there is a notable dearth of accurate and reliable information to be had in published form. A correct map of the underground workings, with a detailed history of the values of the ores, and the more important experiences in mining, would be of great value in the future. Many expensive mistakes will doubtless be made owing to lack of information which might be furnished by a suitable system of record.

It is believed that a good purpose would be served if the State should compel the filing of such information where it would be open to public inspection. It is greatly to the interest of the mining industry to discourage deception and narrow-minded secrecy.

Origin of the California Stamp.



Written for the MINING AND SCIENTIFIC PRESS.

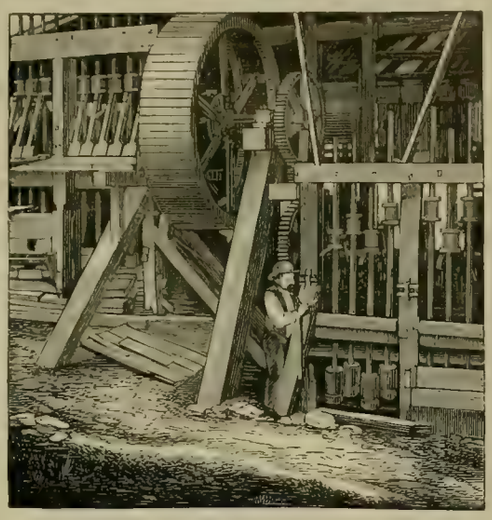
In the winter of 1850–51 a company was formed in Placerville, El Dorado county, California, for the purpose of exploring for gold-bearing quartz. The region chosen for exploration was from Mathenas creek west on both sides of the north fork of the Cosumnes river and as far west as Shingle Springs. Much hard and unsuccessful work was done and continued until about the 8th or 10th of April, 1851, when it was decided to settle up our company's affairs and disband. But before separating, and as we were sitting about our campfire, someone proposed that we explore a certain difficult region that had been neglected. The proposition was agreed to. It was also agreed that we go in pairs, taking three different but (roughly) parallel routes, returning to camp by the trails at night and sharing the results (if any) equally.

A discovery was made. The last two men to get into camp brought word that they had found large outcroppings showing gold everywhere. They had found what was afterwards known as the Union quartz mine, and later as the Church-Union, and is now owned by Senator Perkins and others. The discovery was made on the 12th day of April, 1851. To make sure of our title we moved immediately and made our camp on the ground claimed. After cutting away the brush and building a wagon road down to Mathenas creek, about half a mile distant, we rested and began to discuss what we should do with our discovery. It was decided presently that the only thing we could do was to build a quartz mill and work our mine.

In the meantime the Tennessee Quartz Mining Co. below us on the Cosumnes river, having heard of our discovery, sent us word that they had a steam engine, and iron shaped and punched for a boiler, together with the machinery and irons for a complete five-stamp mill—a duplicate of one they had erected and were running. If we wanted a mill they would sell us the duplicate. We had often seen theirs in operation, and immediately decided that one like it would answer our purpose.

Now leaving out here a long, long story, I will only say that the mill was bought and set a-going, and paid for. None of the present generation can ever know what that meant in the spring and summer of 1851 here in California. This was not, however, the "California stamp mill," but was the mill out of which that was developed. Let us take a look at it.

FIRST STAMP MILL IN CALIFORNIA.



We see no California improvements yet. It was just such a mill as had been made in Tennessee and other Southern States previous to the discovery of gold in California. The bed for the mortar block and the battery frame consisted of layers of timbers crossing at right angles, tamped with sand and flooded with water. On this was placed the frame of the battery, and between the posts was fitted the mortar block, not standing on end and deep in the ground as now, but lying on the ground, as did all the timbers under it. It is easy to see now how springy and unsuitable such an arrangement was.

On the block was placed a low mortar, and the sides were built up of plank and carefully secured with rods and bolts and screws. But, alas! what a leaky affair. In the mortar stood five stamps, each consisting of a head 18 inches long by 6 inches square, *without any shoe*, and a timber 10 feet long by 7 inches square. Through this timber was a slot wide enough to let the cam play freely through it. The upper end of this slot, when the cam stood on the die, was about on a level with the upper side of the cam shaft and was the point at which the cam took hold of the stamp to lift it up and drop it, the stamp being kept in place by suitable guides, top and bottom. The cams were much straighter than the tangent cams now used.

There it stood. It looked to our inexperienced eyes all right. Indeed, we felt a little proud of it; thought we had a better mill than the Tennessee Company. But on starting it we soon found the weak point.

Two of the stamps had become much shorter than the others. On opening the mortar, we found the two stamps had parted from the head. Of course the dove-tail tenon was destroyed and the lower end of the timber badly bruised. The stamps were all taken down and the fastenings to the iron head more carefully fitted.

After being replaced and having run several hours, we found that the heads were of the softest iron and had assumed the shape of a sled-runner,

EARLY CALIFORNIA STAMP MILL.

next to the feed opening. The battery was left standing and a man dispatched to Sacramento with sketches for a boss provided with a shoe. This shoe had a tenon which fitted a corresponding jaw in the lower end of the head. The shoe was held in place by a key driven through jaw and tenon, the key-holes being arranged so as to have a "draw-bore" effect.

We ran that battery till some time in the winter of 1851–52, but (without specifying further) everything about the stamps and mortar proved unreliable. Every forenoon was spent in repairing, the battery calling for the main part.

Not far from us another mill was built soon after ours, but was never run much, as the ore did not pay. One day I went over there. I found it boarded up close and apparently deserted. However, I turned trespasser and, loosening a board, went in. I found the stamps like ours, except that the lower end of the stem was square-tapered and dropped into a correspondingly square socket in the top of the boss. At the lower end of the boss was another square socket, which corresponded to a square-tapered horn on the shoe. This horn was provided with fillets at the corners of each of the four faces, bringing the bearings close to the corners of the socket.

This, however, had proved a bad arrangement, for a number of the corners of the sockets were broken out by the force of the two fillets on each corner of the horn. The remedy for this difficulty was easily indicated. Make the horn and socket round. This led presently to the idea of making all the parts to the stamp round instead of all square, and make the stem of iron. At this point came into view a fairly clear vision of the stamp as we see it now in a California stamp mill. But as yet it was only a vision.

I told my brother (president of our company) what I was thinking of, and directed the carpenter to make a model of a stamp as above described. The stem was about 3 feet long by 1 inch in diameter, the boss being 2½ by 6 sinches long. The shoe was 2½x2½ inches, and all held together by the tapered horn and stem forced slightly into the tapered sockets in the boss. This was the first concrete form of the California stamp.

Armed with this model, my brother and I decided to approach certain of the company and propose the building of a battery on this line. This was received with some favor, but the company as a whole would only consent to putting in one stamp in the middle of the old battery for the purpose of trying it; at the same time enjoining me to make it as cheaply as possible.

Well, this was something. So I left the next morning for Sacramento. No iron was there such as I wanted, which was a piece of shafting 10 feet long by 3 inches in diameter. I went to San Francisco. No iron was in all the town of that size, but Messrs. Egery & Hinckley had two pieces, 12 feet by 2¾ inches, one of which was sent up to Sacramento to the Sacramento foundry. Here, in due time, a stamp was fitted up and sent to the mill, and put in place of the middle wooden stamp. On starting, it won its way easily. It came down with such evident efficiency that it was not long before the company decided to have a new battery. This was in the autumn of 1851.

Incidentally, while down at San Francisco for iron for this one stamp, I had learned from Mr. Egery (of Messrs. Egery & Hinckley) that they had afloat a small lot of 2¾-inch shafting that would be due early in the following February. So all we could do was to wait for that iron.

I came down about the 6th of February, 1852, and found the iron had come. As we could use the old battery as it stood, all we needed was the five new stamps and their fittings. These, I remember, Mr. Egery sent us with very gratifying promptness. It was not long before we had our new stamps running.

But in this first battery the stamps did not revolve. They were held from turning by a short arm from the top of each stem, standing out at right angles to the cam shaft. The outer end of these arms played in suitable slots.

We had an engineer and machinist in our employ, who took great interest in our new stamps. His name was Isaac Fisk, a man full of resources in his line. He suggested the idea of modifying the tappet so as to present a full face clear round the stem, and, removing the arms and slots, let the stamps revolve at will. But our old-fashioned cams were not curved enough, nor was the curve drawn on the right principle. A simple investigation showed that the corner of the cam would rake across the corner of the tappet during a part of the lift, and it was thought that both would be ruined directly. But Fisk contended that it would work, so we tried it on one stamp, and found that the constant turning of the stamp so distributed the lubricant (pitch-pine tar) that there was practically no cutting. This was the first revolving stamp. We presently fitted the other four in the same way.

We found we had made a great improvement and our mill was soon attracting much attention. Revolving iron stamps were soon in use in various directions, and from that day to this only slight modifications have been made in them.

At this point I might close this paper, as, strictly speaking, your question has been answered. The battery, however, as a whole, has been greatly improved. I will give a list of the principal improvements:

1. The Automatic Ore Feeder: I applied for and received letters patent for an automatic feeder in 1858. My principal claim was for a lever regulated by a set screw as and for the purpose described. This claim held for twenty-one years, the patents

having been renewed in 1872, as provided by law at the date of that patent. This lever proved to be indispensable, and is used on all the ore feeders in general use. Thomas A. Cochrane of Tuolumne county was the most successful improver of the original device.

2. The Gib Tappet: The late Zenas Wheeler in 1862, then a mill manager at Gold Hill, Nevada, improved the original tappet of 1852, calling the modification "the gib tappet." This was further improved by Prescott, Scott & Co. (now the Union Iron Works), by casting the tappet with the gib in place and then boring out all together.

3. The Latches and Billet of Wood: I had what answered for the latches, but the billet of wood placed between the faces of the tappet and cam as a remedy and simple way of placing the stamps on the latches out of the reach of the cams I did not discover. I would like to know the genius who first did that.

4. The Mortar Block: This, as now made, is *set on end* and deep in the ground. Originally the mortar stood on timbers laid flatwise.

5. The Mortar: A high mortar instead of a low one, with sides built of wood.

6. Tangent Cams: A good improvement.

The origin of the four last is unknown to the writer. Besides these there are some minor devices that a battery man would not be ready to spare, the origin of which cannot be traced.

I have made some effort to discover the origin of those shoes with square-tapered horns which I found in the deserted mill. I know the men who built the mill, and also the firm that furnished the machinery and castings. But they have all passed away except E. T. Steen of this city. He remembers the mill very well, but does not remember any details.

C. P. STANFORD.

A Pioneer Miner.

Herewith is presented an excellent picture of a typical California miner—Almarin B. Paul—one of the men who made California history, and one who can say, "all of which I saw, and part of which I was." Mr. Paul is now in his 75th year. He was educated at the St. Louis University, came to California in 1849 as a merchant, was for a time head of

ALMARIN B. PAUL.

the firm of Paul, White & Co. of Sacramento, but, having a greater fondness for mining than merchandising, sold out in the fall of 1850 and in the spring of '51 went to Nevada county. Senator Geo. Hearst was for years his partner in mining. He is to-day one of the oldest quartz miners in the State of California. In 1853 he became a resident of San Francisco, engaging in the real estate business; in 1855 published the *True Californian*, in company with Washington Bartlett, afterwards Governor of California, and his brother. He was an active member of the Vigilance Committee of 1856. In the fall of 1856 he closed out all business in San Francisco and again went to Nevada county, where he entered at once into mining, building a mill within sixty days of his arrival there. He remained in Nevada county until April, 1860, when he went to Washoe, examined the Comstock lode and was so taken with its apparent riches that he concluded to remove there, and at once entered into a contract with the several companies for working their ores at $30 a ton. He took contracts amounting to $450,000 and agreeing, before a pound of iron was cast or a stick of lumber cut, to have a 24-stamp mill, with twenty-four pans, up and running in sixty days, or forfeit $40,000. The mill was put up and running in just fifty-eight days from date of signing contract. Considering that all machinery had to be hauled over the mountains, this was a daring piece of business; but he did it. This was the first silver mill on the Comstock and in the State of Nevada. He is the inventor of the iron pan process for working silver ores, and which was known on the start as the Washoe pan process, now used all over the mining world, and is the inventor of much machinery for mining. He mined on the Comstock for five years, then sold out and engaged in the banking business at Gold Hill, and remained in this until he sold out to the Bank of California, then managed by Wm. Sharon. Since 1878 he has been a resident of California, mining in its various localities. From first to last he has been a writer as well as worker, and is the oldest contributor to the MINING AND SCIENTIFIC PRESS. Mr. Paul says: "My earnest desire has always been to build mining up by improvements and have always been an active operator and have no cowardly dollars ever on hand."

Beginning of Quartz Mining in California.

From 1848 to Discovery of the Comstock.

Written for the MINING AND SCIENTIFIC PRESS.

Gold being so abundant in all the rivers and mountain gulches of California in 1848-'49 and it requiring merely physical labor to become possessed of it, but little attention was paid to the ascertaining from whence the gold came. However, soon the investigator began to survey the surroundings, and discovering quartz "in place," which the more scientific miner knew to be the matrix of gold, it then awakened the possibility of great riches by mining the quartz for gold. Then came also the question as to the most suitable machinery for extracting the metal. The first idea of course, after getting the quartz out, was to crush it down finer, and the next, to wash the material through sluices and the gold, through its gravity, would take care of itself, provided riffles were put in the sluices. These were the crude ideas of the beginning, and in time they were put into action. As to date of erection of the first mill for reducing quartz there is some uncertainty. It is claimed a small engine and machinery were taken to Mariposa county early in 1849 for Col. Fremont; if so, the "machinery" must have been an arrastra, or a "Chili mill." This claim, to hold good, wants to be better established than it is. In 1850 machinery for a mill was landed at the town of Mariposa, Mariposa county. The superintendent of this was John Burnett. This mill consisted of two or four Stockton batteries. The Stockton battery was a single stamp in a single mortar, in weight about 300 pounds, each mortar being independent, each having an opening behind for the feed and a small opening in front for screens and discharge. This claim I regard as correct, and was, strictly speaking, the first quartz mill of California.

Early in 1850 quartz mining began to attract attention, as many rich deposits of gold were found "in place," especially in Mariposa and Nevada counties, and about Grass Valley, in the latter county, many veins were prospected. To have a vein of quartz carrying gold was for a time considered more certain for permanent wealth than river diggings, hence the interest.

About September, 1850, a very rich gold-in-quartz find was made at Grass Valley, Nevada county, from which $20,000 was pounded out in a mortar. Grass Valley and Nevada, in consequence of the discovery of so many gold-bearing veins, soon took prominence, and about January, 1851, W. J. Wright built a small 4-stamp wooden stem mill, which was run by water power. About the same time Stanford, Fisk & Co. built a similar mill on the Cosumnes. It was at this early day, and at this mill, that was first conceived the idea of the revolving stamp which in these after years has played so important a part. Before July of 1851 some four or five mills were projected, notably those of Crossett & Co., Winchester, Chapin & Co., and Skinner & Rivett. The latter mill was erected at Gold Flat, about half-way between Grass Valley and Nevada. If my memory serves me rightly, all except the latter mill had square wooden stamps, with simply riffled wooden sluices for catching the gold.

In the fall of 1851, I became interested in the Skinner & Rivert mill. It had at first two Stockton batteries, already described. These soon proved impracticable for working any quantity of ore, and were replaced by an "up to date" stamp and mortar. In explaining this mill it explains the best mills as then constructed in California.

For a foundation, several sets of heavy timbers, alternately placed, horizontally, were put in, and on top of these was fastened the horizontal mortar timber; into this timber was inserted the cross mortar bed, also the side posts. The iron mortar, see Fig. 1, was simply a piece of iron 18 or 20 inches wide

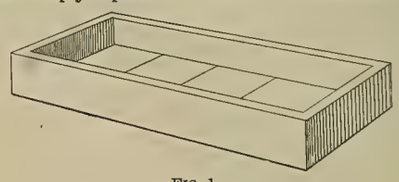


FIG. 1.

and from 42 to 48 inches long, and say 12 inches deep, according to size and number of stamps to be used. The usual size being for four stamps. Mortar and posts being in place, a wooden casing was made, having openings for feeding, and on front an opening for the screen. This casing was lined with the heaviest sheet iron obtainable. The stems were made generally of oak, squared to 8x8, and from 9 to 10 feet long. The shoes were square, also, and of same size as stem. The shoe end of stem was banded with iron. These oak stems had two ways of being lifted by the cam—one by a projection and the other by a slot in the stem, as shown by Figs. 2 and 3.

FIG. 2.

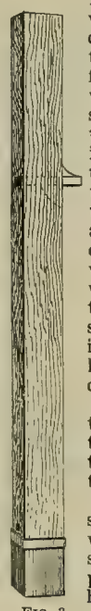

FIG. 3.

The cams for these stems were after the fashion of cut, Fig. 4, and were anything but symmetrical, yet filled the desire of the time, which was to give the stamps a lift of from 10 to 12 inches, stamps making only twenty-five to thirty-five drops per minute, height of drop at the time being considered more advantageous than less drop and more speed. The weight of stem and shoe was oftener 550 pounds than over. The square shoe, usually made of soft iron, soon wore into all kinds of shapes, as the cuts cuts illustrate. (See Fig. 5)

As the advantage of getting hard iron increased, this trouble decreased, still the wear, though less, was the same.

In this early period, screens for the battery were made of common sheet iron, the holes being punched at random by home-made punches or the sharp end of a file. All feeding and breaking up of the quartz was done by hand. Some mill-men used quicksilver in the battery, but usually they did not.

The pulp from the screens flowed on a wooden

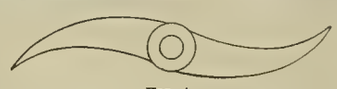

FIG. 4.

platform, having wooden riffles, and from this into sluices made of 12 or 14-inch boards, these having also riffles every little ditance.

Among the pioneer miners were many from Mexico, who were familiar with making and working the Mexican stone arrastra. Of these many were made,

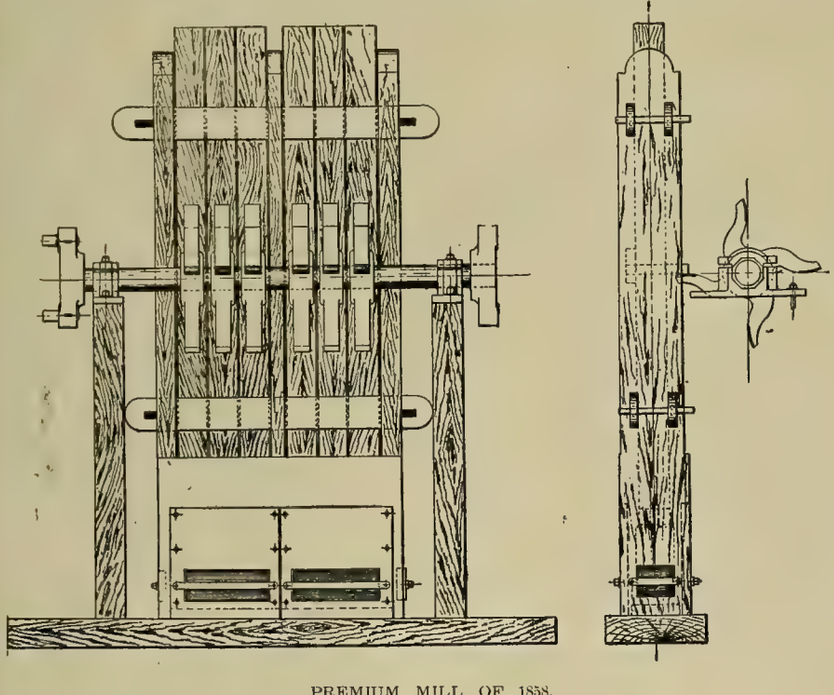
FIG. 5.

generally in size from 8 to 10 feet in diameter. These were run by mule or horse power. There were more of these arrastras in the southern than in the northern mines. They were very popular and profitable machines.

As time passed new machinery as gold-savers came on; among them was the German skaking table, and the use of blankets in sluices, which were washed by hand and was a laborious duty.

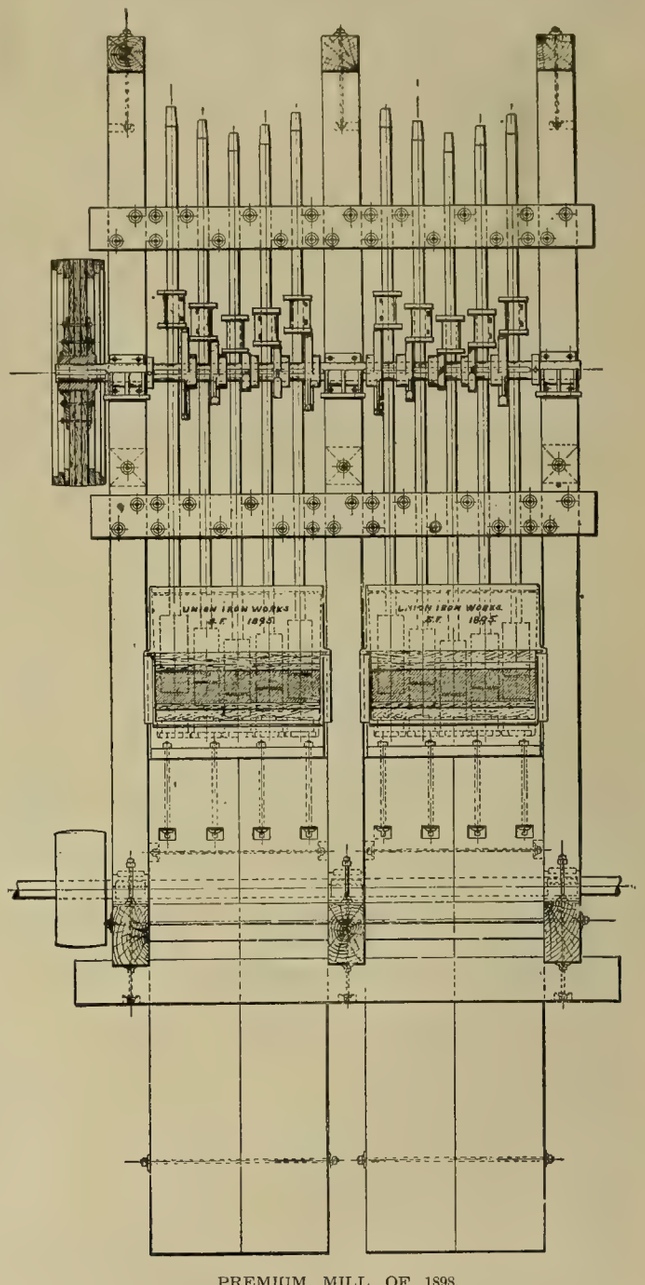
So crude was our knowledge and working at this period, and even up to 1853, that now, looking through the telescope of near fifty years, I see, com-

paratively speaking, we simply knew nothing of the the real science of gold extraction, and yet we knew about as much as the rest of the mining world, and no one can more clearly appreciate the advanced present than myself. In these earlier days gold of the size of small pinheads we hardly expected to save, and so limited was the capacity of mills and the percentage of values saved, together with the heavy expense for working the mines and milling the ores (miners' wages being $6 and $8, engineers $10, general hand from $4 to $5 a day, with everything else in proportion), that $20-per-ton ore on the average would not more than pay the expenses, and I now see it took ore having a full value of $100 per ton at least to even pay expenses, as not over 20 per cent of the value on the average was extracted. Thousands of tons were worked that paid over $100 per ton. The writer washed hundreds of tons in the crude way of the time averaging from $100 to $300 per ton, and here I will say the $25 ore was decidedly "low grade."



Grass Valley and Nevada were virgin fields, as were all the other quartz sections, and thus only the richest ores were milled. That there was a wastage of gold all supposed, and new devices soon appeared for saving it, and yet but few miners really comprehended the actual loss as now gold extraction is understood. The richness of the sulphurets was known to the assayers and a few others, but how to profitably handle them was the question.

About 1853 copper plates coated with mercury began to be used to a limited extent, and as time passed the more popular they became. Plating copper with silver was not thought of until after discovery of the Comstock. For concentrating the sulphurets and finer gold blankets held their own, yet different devices came to the front, and among them the Bradford separator, which was a most excellent machine except that it required too many to do any amount of work. Chili mills were soon introduced; also stone arrastras for working the blanket washings, the latter proving very practical and profitable. Among the profitable mills of the earlier days was the Allison Ranch of Grass Valley. This mill had only stamps and blankets, and long sluices of the latter. It was quite a sight to see one of their "clean-ups." All the upper blanket washings were "panned out," and it was no unusual thing to have $500 in each pan, all bright gold, they using no quicksilver in their battery.



By 1855 there was a great advance, not only in the number of mills but in styles. The mortar and stamp as described gave way to a higher one, high enough to take in the feed and screen frames, some being made for four and others for five stamps. About this time several styles of iron batteries were introduced, as there was a general desire to get rid of the clumsy wooden stamp stem, leaky encasement and square stamp. Among these iron batteries was the W. H. Howland circular, which had round iron stems, and to operate it the stamp had to revolve; and as far as my memory goes, this was the first practical revolving stamp mill—yet to Mr. Isaac Fisk is due the conceiving of the revolving stamp. Another iron mill was brought out having two square iron rods as stems set into the bosses of the shoes, the two rods being separated wide enough for the cams to ply between and onto a tapit or bonding lift bar. The several styles began to suggest new features for the regular line battery. Cornish rolls, English buddles and jigs, all had their trials, giving but little satisfaction. Blankets in sluices, copper plates and the arrastra, all held their own.

About 1855 C. P. Stanford introduced his self-feeding device, and this marks the first step forward in this line; yet it was several years before there was any special interest taken in using it. Stanford's first patent possessed the vital feature of every self-feeder since introduced—the lever operated by the tappit.

The first parties in California to branch out from the "practical" into the scientific field for extracting gold from the sulphurets were G. J. Ott and companion, F. Besselen of Nevada City, both expert metallurgists and assayers, who spent considerable time and money in operating the chlorine process, which at this time was in its more crude state. These parties erected at Grass Valley in 1858 a small reverberatory furnace, and many tons of sulphurets were worked as concentrates by the blankets and various other devices. This chlorination plant proved a success in point of per cent of the precious metals saved, the average working being up to 88 per cent of the value, but furnace being small, the capacity for work was quite limited. Their charge for working was $50 per ton. From 1855 to 1858 there was a general feeling that in a few years the quartz gold interest would expand into an immense and valuable industry, and, to advance it, in 1858 the directors of the State Fair appointed a commission to examine and report on the best mill of the State, offering a premium for same. The premium was awarded to the Agua Fria G. M. Co., generally known as the "Gold Hill mill," of Grass Valley, of which my esteemed friend, Mr. Melville Atwood, was the general manager. This mill had twenty stamps and was the largest of the time. All the iron work was sent out from England, and was the best the English then knew, and that the general reader may comprehend the advance, I here present the premium mill of 1858 and the premium one of 1898.

PREMIUM MILL OF 1858.

PREMIUM MILL OF 1898.

At this date quartz mining in California was in a very flourishing condition. There was plenty of profitable ore, and a general good feeling for the pursuit prevailed all over the mining sections of the State. Capital for sensible investments was easily obtained, but soon a disturbing feature presented itself, and this was the discovery of the Comstock in the winter of 1858. The fabulous tales of the riches of "a lode that could be traced for five miles, having plenty of ore that would go $1000 a ton" (all of which proved true), caused in the spring of 1860 a general stampede of the mining men of California, very many leaving valuable interests behind them, and among these was your humble servant.

What California lost by this exodus the Comstock gained, for there the men of enterprise and experience rushed, carrying with them the spirit that prosperity in California mining had infused. Capital also changed its locality for mining investments. Thus the opening of 1860 seriously affected the quartz mining interest of California, and this date I now set as the closing one of this article. To further illustrate how California was affected, I will add that the difference between her gold production in the succeeding three years, as compared with the three years preceding the discovery of the Comstock, was $26,000,000. And here it is well to say that 1860—on the Comstock—opened the greatest and grandest mining period of all the ages.

The great advance made then and in after years was not local only, and in California to-day, and all over the mining world, can be seen the bold and progressive idea of the intelligent operators on the Comstock. And here I am prepared to say that from 1860 to 1890, a period of thirty years, greater progress was made in all that tended to advance mining in its many departments than had been made in the preceding 500 years. I admit this is hard to realize, but if you doubt it work up the past as I have, then analyze the metallurgical, mechanical and electrical advances of this latter period, and you will not only admit it, but feel proud that you lived in an age of such wonderful progress.

ALMARIN B. PAUL.

San Francisco, Cal., January, 1898.

PROBABLY the earliest record of a stamp mill is found in Agricola, published in 1556. He tells of one built in the Hartz mountains in 1529, and gives a picture of it. It shows great wooden stems, 8 inches square, raised by projecting pins from a revolving shaft. He tells us that the stamp heads were of quartzite or iron. The mortar was a trough with a stone bottom. The power was furnished by an overshot wheel. Even up to 1856 the wooden stem was still in use, and it was said that iron stems could not be used because the jar would break them. The old straight cam, scarcely any different from the straight pin of Agricola's day, was in use until displaced by California methods, as told elsewhere in this issue.

Gold Formations in California.

Written for the MINING AND SCIENTIFIC PRESS.

"California!" What a halo of golden glory surrounds the mystic word. For fifty years it has been the synonym of success, of gold, of happiness—but never of idleness. A land whose valleys are bathed in perpetual sunshine; whose lofty mountains are crowned with eternal snows; where climatic conditions are perfect, and where "digging for gold" is a pastime.

More than thirteen hundred millions of dollars in gold from California's mines—conceive, if you can, this vast glittering pile of wealth. Nowhere else on earth has gold been distributed in such abundance, and nowhere else has it been so easily obtainable.

What more happy sequence of geological events can be imagined than those which made this possible. It would seem that kind nature had almost surpassed itself in creating for mankind so beautiful a land, where gold might be had in abundance for little more than the asking. A delightful climate, never failing rivers of pure water, vast forests of timber—a miner's paradise.

How the Sierra Nevada was Formed.—Conceive a broad area of sediments—shales, sandstones and limestones—lying under the ocean's bed, in nearly horizontal sheets. These appear to have been uplifted, contorted and crushed by the intrusion of vast masses of basic eruptive rocks, chiefly diabase and diorite. It is not unlikely that the serpentines, which form quite an important feature of the geology of the gold belt, were also erupted at this time, or shortly thereafter. It is probable that this period of disturbance and the eruption of these dark, basic rocks continued for some time.

Subsequent to this, occurred the intrusion of those enormous masses of granite (grano diorite) which for most part make up the great Sierra Nevada range, famous throughout the world for its grandeur and picturesque beauty.

Whether the introduction of the granite was violent or whether it was a slow process, requiring ages to complete, is a question upon which all do not agree; but there seems to be sufficient evidence at many places along the contact of the granite with older rocks, both sedimentary and eruptive, that it was accompanied by tremendous crushing and folding, and an uplift of most violent character, and it is the belief of the writer that it was to this irresistible force that the shearing of the greenstones is due, which later resulted in the alteration of large areas into what are now termed amphibolite schists—a term employed to designate all of those rocks altered from massive diabase and diorite into chloritic and talcose rocks. The sedimentary rocks also shared in this process of alteration from the same cause, and we now find in place of sandstones, shales and limestones, quartzites, clay and magnesian slates, and crystalline limestone (marble) with many intermediate stages of alteration, such, for instance, as micaceous sandstone and mica schist, mica slate, and, often near granite, gneissoid rocks. We also find calcareous sandstones and silicious shaly or slaty rocks.

Formation of the Great Fissure System.—The intrusion of the granites was followed by much shifting, uplift and subsidence of the region. This movement of the great rock masses resulted in the formation of vast fissure systems extending for hundreds of miles in a direction approximately paralleling the crest of the Sierras. These fissures also extended into the granite itself. It is quite possible that the contraction of the molten granite on cooling was a very important factor, the shrinkage resulting in forming many crevices, some of which were doubtless filled with later-dike rocks of coarser crystallization, but also of granitic type, such as are so commonly found in the granite region.

The fissures were great rents, as it were, in the rocks, extending to unknown but certainly very great depth. These fissures were not necessarily all open spaces, though doubtless some were. They were fractures which extended often great distances, running in a general direction, though having a more or less sinuous course, a varying angle of dip and many branches. These fissures were lines of weakness, and as the movement of the great rock masses continued the rocks slipped upon these planes backward and forward, up and down, sometimes in one direction and as often in another. In many veins the striations and polished rock faces indicate the direction of movement, which is almost always found to be obliquely along the strike (course) of the vein. Not infrequently two or more series of striations or grooves may be observed, each in a different direction, indicating clearly that the movement has not been confined to a single direction. It is thought by many that striations on the walls indicate the direction of the pay shoot. Frequently they do, but not always; though where the contrary is the case any original striations conforming to the pitch of the ore shoot may have been entirely destroyed by subsequent movement in some other direction.

Normal and Reverse Faults.—The law of normal fault—that is, that the hanging-wall side of the fissure sinks relatively to the foot wall—does not always obtain, for it is as often found that the hanging-wall side has been forced upward, and we then find the "thrust" type or reverse fault. As far as my personal observation has extended the latter type of displacement is by far the more frequent in California.

This tremendous movement of rock masses upon each other must have continued for a very long period, and the movements may still be in progress. As a result of these movements we find the rocks along the fissures crushed and often pulverized, forming what are termed gouges of clay-like material. It is not difficult to fancy the result of any change in the direction of either the strike or dip of a fissure. Had the fissures been perfectly true planes, having a straight strike and uniform dip, it is scarcely likely that we would have found such great width of vein material—often upwards of 100 feet in width and sometimes greater. Not infrequently we find a series of nearly or quite parallel fissures, forming a zone of crushed and pulverized rock all more or less altered from their original condition.

The Creation of Gold Veins.—It has been stated that these fractures extend to profound depths, reaching doubtless thousands of feet, in many cases, into the earth. Along these fissures arose waters, probably hot and bearing in solution abundance of silica with base metals, chiefly iron, copper, lead, zinc, antimony and arsenic, together with gold and silver, and also a most prominent and important element, sulphur. The fissures formed channels along which these hot mineral-bearing solutions might readily pass. As they ascended, penetrating every crevice, crack and space of discision, and often even the rock walls themselves, the super-laden solutions precipitated their mineral contents. Much of the crushed and pulverized rock mass was removed by the dissolution of the soluble portions, and silica, metallic sulphides, silver and gold deposited atom by atom in their stead, the material dissolved being carried away in solution by the ascending waters, or redeposited in the form of new compounds—carbonates and silicates—forming a portion of the mineral vein itself. We find in many veins an abundance of calcite and magnesian material, derived in all probability from the alteration of the original rock mass in which the fissure occurs.

It is undoubtedly this process, continued through ages, that resulted in the formation of these, the richest gold-bearing veins the world has ever known.

The Great Dolmitic Vein.—That portion of the gold belt known as the "mother lode," extending from the southern part of Mariposa county to Carson Hill in Calaveras county, and characterized by its enormous outcrops, in some places extending for miles in an unbroken line, consisting largely of dolmitic material and mariposite, I believe to have been originally a great dike, now changed by the same processes which altered the other rocks, the great veins, lenses and masses of quartz included in it having been formed in the same manner as quartz in veins elsewhere, the silica having replaced the dolomitic material in part, though no doubt some of the quartz was formed in open fissures or cavities, as is indicated by the beautiful, well-formed quartz crystals frequently found in these masses.

Formation of Ancient River Gravels.—What may have been the topography of the region of the gold belt in that early period we can only fancy. Undoubtedly it consisted, as to-day, of elevations and depressions. There is every indication that the rainfall was much more abundant then than now, and many of the streams were large. Erosive forces are always at work and have been since the world began. As soon as a rock mass is elevated above the level of the sea its destruction commences at once.

The great gold veins required a long time, no doubt, for their formation, but the work of degradation was also in progress at the same time. The creeks united to form rivers and the waters flowed on to the sea, just as they do now, and they carried along the silt, sand and gravel derived from the decay and wearing down of the hills. Floods were probably not of infrequent occurrence, as may be easily imagined when considering the enormous size of some of the boulders found in some of the ancient river channels. Ice may also have performed an important part in the transportation of the vast amount of material forming these old river beds.

Source of the Gold of the Ancient Rivers.—Most of the larger rivers of that age had their source well up in the Sierras, and it is an important fact that they are gold-bearing as far as they have been traced and investigated. Here is an important fact which appears to have been overlooked. The gold found in the gravels of these ancient rivers was largely derived from a region far to the eastward of the recognized limits of the gold belt. Take for instance Placer county, famous for its great drift and hydraulic mines, which have produced hundreds of millions in gold. From what source was this gold derived? Certainly not from the gold belt, but from a region east of it, in the high Sierra itself. Although this particular region—eastern Placer county—is covered to a great extent by hundreds and in places thousands of feet of andesite tuff, there remains no doubt in the mind of the writer that the gold veins from which the vast amount of wealth found in the gravels of Iowa Hill and Forest Hill divide are in the crystalline rocks underlying the lava rocks. The high Sierra has not been closely investigated for gold veins, the general impression being that there are no veins there. There is no evidence to substantiate this idea, while on the other hand there is every reason to believe that there is a gold belt in that high snow-covered region. Altitude is not a factor in the case at all. The most of Colorado's great gold mines are at altitudes of 10,000 feet or more above the sea.

Although for fifty years the State has been searched "high and low," but mostly low, for gold, every day brings to light new evidence that we have only a superficial knowledge of our great mineral resources.

Croppings Not the Original Surface.—The surface exposures of our mineral veins called "croppings," it must be remembered, do not represent the original surface. These croppings were at one time deep down in the rocks, hundreds and even thousands of feet, and these surface exposures were formed in precisely the same manner as those portions now being exploited in our deepest mines. The amount of erosion generally has been enormous. A study of the ancient river channels will convince any one of this. Since the age when these old river beds were formed the recent streams have cut their way down through the lava caps, and hundreds, and in some cases 2000 feet into the hard underlying rocks, as is the case in the canyons of the American river; and there is reason to believe that these ancient rivers also at one time flowed through canyons whose walls were, perhaps, just as high. All over the region of the gold belt thousands of feet of solid rock, with the enclosed gold-bearing veins, have been eroded and the material swept off into the valleys of the great interior basin.

There are those, no doubt, whom it would be difficult to convince of this important fact, for we are all too much inclined to measure the great forces of nature by what may be within the power of human agency to accomplish, and to measure time by the brief experiences of our life. It is impossible for the human mind to comprehend the immensity of a single geologic age.

A Popular Fallacy.—There are some fallacies quite popular among miners. These peculiar theories are not usually based upon sound reasoning, nor upon facts demonstrated by fifty years of mine development in California, nor by the experience of centuries of vein mining in any other portion of the world. How often we hear it said in the case of a somewhat discouraging prospect at or near the surface, "Oh, this is only at the surface; when depth is attained this will prove to be a rich mine!" And who shall presume to dispute this statement? As pointed out above, the "croppings" of to-day are not at nor, in most cases, anywhere near the original surface. There are many practical evidences among our mines that prospects, poor at the surface, in depth proved great and valuable mines. There are also as many others where mines, rich at and near the surface, proved poor and unremunerative a few hundred feet below. Still, this does not prove that further development at greater depth will prove unprofitable. I have in mind several mines in which the veins at and near the surface proved poor, small and low grade, but in the lower levels to-day we find immense ore bodies, rich in gold and paying handsomely. On the other hand I have knowledge of five great mines which together yielded nearly $20,000,000. Of these three are now idle; one of them is 600 feet deep, one 800 feet and the third about 900 feet. The other two, after years of idleness, have resumed operations and are to-day among the leading mines of the State. No one familiar with the three idle mines mentioned would be willing to admit that their values are exhausted. These five mines are cited simply as examples, for there are many others now idle where there is every reason to anticipate that a resumption of operations would prove entirely satisfactory. Most of the new mines now coming into prominence are old mines, shut down years ago, recently reopened with every indication of success.

Permanency of Our Mines.—It has been shown that from the nature of the origin of California gold veins the fissures must extend to great depth. It is an important question asked by the intending investor, "To what depth will vein mining pay?" The deepest mines in the State show no depreciation in the average value of the ore, and there is at present no reason to believe that the gold values per ton will be found to decrease with increasingly greater depth. The depth, then, to which mining may be carried on profitably in California is only limited to that point where the cost of production entirely absorbs the output, and the possibilities in that direction are yearly growing greater through the agency of improvement in machinery and mining methods as well as in the treatment of the ores.

Behind the Times.—What California most needs is to shake off—not the spirit but the methods of '49.

It is a fact that although we have had the most prolific gold field the world ever knew, and our resources are still almost boundless, we are ridiculously behind the times, in many of our methods What we mostly require now is new capital and a class of more energetic men; more enterprise, more railroads, newer methods of mining, and in some instances the introduction of metallurgical processes now in successful operation elsewhere.

The comparison may seem insidious, but if California would imbibe some of the spirit of Colorado, South Dakota, Michigan or Montana we would accomplish a success which would place this State at the very front of the gold-producing regions of the world.

New Capital Required.—It may seem strange to the Eastern investor that we should say that California requires outside capital. "Has not California scores of wealthy men, many of whom are millionaires?" they ask. It is true we labor under this disadvantage. We have quite a large number of *retired* millionaires. We also have a much larger number of wealthy men, not classed among the millionaires, whose fortunes are still very large, and many of them made their fortunes in California's mines, but only a few of these gentlemen are to-day in the active field of mining. Their fortunes are invested in real estate, mortgages, bonds and other securities, and they are now living in ease, with few business cares to annoy them, and these men will not again enter the field of mining nor invest in mines. Then there were those who accumulated great fortunes who are gone, leaving the inheritance to their sons and daughters, and these know absolutely nothing of mines or mining, and they have not the least desire to become acquainted with it in any form whatever—not even as investors.

Such being the case, we naturally look outside our State to the great financial centers of the East, and even to Europe, for capital to invest in our mines, knowing that intelligent investment will in most cases result in success.

Modern Appliances and Methods.—It must be said candidly that the best engineered and most thoroughly equipped enterprises, as a rule, are found in the hands of Eastern or foreign investors. This is not without a generally beneficial effect, for these new enterprises are demonstrating that they are able to accomplish, with their superior plants and scientific methods, greater results at less cost than where the old time ideas are still followed; and Californians, already seeing these advantages, are beginning to adopt these "up to date" ideas. The past three years has seen great strides toward improvement in this direction. A better class of machinery is being installed, and more methodical, far-seeing plans of development and exploitation are being adopted.

Electricity and compressed air are finding a wider field of usefulness, and more attention is being given the metallurgical branch than formerly. Ordinarily, however, California gold ores give very little trouble, and are successfully treated at as low a cost as anywhere else in the world. Some few districts, however, still have problems in this direction to solve, but appear in even these isolated cases to be upon the verge of success.

W. H. STORMS.

A RECENT visitor to Rhodesia, describing in the *Contemporary Review* the gold mines of that region, mentions one more particularly in the Gwanda district, which has been re-discovered by a Mr. Andrew Nicholson, and has received the name of Geelong. So much confidence is felt in its richness that £100,000 is being spent, under the direction of experts, in its development. But what is chiefly remarkable about it is that in sinking the shafts the men employed came upon very extensive old workings. In fact, the whole hill seemed to have been tunnelled at some remote epoch. In the course of their excavations they reached a "timbered chamber, 500 yards long, containing vast quantities of rich quartz, ready broken down from the reef, partly burnt, and ready for the battery. The timber was still in this mine, and large numbers of diorite hammers were found. This discovery proves that the ancients knew how to treat the quartz with fire when they could not otherwise break it small enough to get the gold out." But why should operations have been suddenly suspended in these rich reefs? And why should they have been deserted by the miners, who seem to have left their tools behind them? The writer answers these questions thus: "The conjecture is that they were the same people who built what are now the ruins at Zimbabive, probably some thousands of years ago. Some accident, some plague, wet, or other catastrophe, would seem to have come and swept them all away; and for centuries those reefs have been awaiting a new discoverer. What is true of this mine is, no doubt, in a measure true of a great many others, for the country is covered with these ancient workings." At Tebewke there are old workings on a reef which have been traced along the surface for a distance of 2500 feet; and trees were found growing from bottom of shafts at least 100 years old. So far as recent sinkings have gone, they have proved that the reefs descend to a much greater depth than the levels at which they were being worked at the time those primeval operations were so mysteriously arrested.

The Correct Date of Marshall's Discovery.

In connection with the present golden jubilee, commemorating the fiftieth anniversary of the discovery of gold in California by J. W. Marshall, it is incumbent that the exact historical facts be given. It is now generally published that such discovery was made January 24th, 1848. That is not correct. The date of the discovery was January 19th, 1848. This matter came up in September, 1884, when the statement was published that the date was January 18th. Marshall was then visiting San Francisco, and in an interview with the editor of the MINING AND SCIENTIFIC PRESS stated with much detail and faithfulness that January 19th was the correct date. That settled the question for the time.

About ten years ago there was brought to light and published in this city a diary, or portions of a diary, kept by Henry W. Bigler, one of the men employed on the Sutter sawmill at the time of Marshall's gold discovery. In this diary occurs an entry which purports to have been made on the day that discovery took place, but which conflicts with the heretofore accepted date of that event, which, according to Marshall, Sutter and others, who certainly ought to know, occurred on the 19th day of January, 1848. According to the entry in Bigler's diary, it occurred on the 24th day of that month.

As there seems to be a present disposition to adopt this latter as the true date of the gold discovery, it may not be amiss to examine a little and see what, if anything, there may be to justify such change in the chronology of that notable occurrence.

According to Marshall and Weimer's version of the discovery, they two were, on the morning of January 19th, 1848, walking down the millrace to see what execution the water let in the preceeding night for the purpose of deepening the channel had effected. Marshall, being a little ahead, was the first to espy a piece of yellow metal lying on the side of the race, which, picking up, he and his companion, after a careful examination, came to the conclusion was gold. Searching further and finding more of this metal, they resolved they would keep the discovery a secret long enough at least to enable them to get in a stock of saw logs, the mill itself being then about completed. They knew, as subsequently happened, that if the secret got out the men in their employ would at once quit work and go to gold-digging, thereby putting an end to all log-hauling and lumber-making, notwithstanding the latter was so much needed at the fort.

Adhering to this resolution, both Marshall and Weimer assure us that they kept the gold find a profound secret for several days after it happened, having succeeded meantime in getting a supply of logs cut and hauled to the mill. This accomplished, they let the secret out; that it so say, having kept it to themselves until the 24th of the month, they then gave it publicity, and the fact coming to the ears of Bigler he, as was his wont when anything noteworthy happened, jotted it down in his diary, the entry running thus: "January 24th—This day some kind of metal that looks like gold was found in the tail race." Now, clearly Bigler could not have made that entry on the day the gold was found. To suppose that he did would be to presume that Marshall and Weimer rushed off at once and not only acquainted Bigler with the fact, but took along a quantity of the yellow metal for his inspection, which would be to gainsay reason and discredit all that these men have told up about the circumstances attending the gold discovery.

That Bigler did not at the time attach much importance to the reputed gold find is evident from the fact that there appears no further entry in his diary until January 30th, when the following remark occurs: "Our metal has been tried and proved to be gold. It is thought to be rich." For nearly a week after the discovery, adopting his own chronology, he continues working in and about the mill, paying so little attention to it that only after the expiration of six entire days does he find out that the metal is actually gold.

The discrepancy between these dates is easily explained. Marshall gives us, as he had every reason to do, the veritable day on which the discovery took place; Bigler the day on which he first heard of it, under the impression, probably, that it was really the day on which the event happened, or he might have worded the entry in the manner he did through inadvertence. Nor is it on the testimony of Marshall alone that this version of the ever memorable incident rests. It is confirmed by the statement of Peter L. Weimer, Mrs. Weimer, his wife, and all the hands at the mill, other than Bigler, and even by that of General Sutter himself, who could by no possibility have been mistaken on this point. To suppose that all these people, who had the best opportunity to know whereof they speak, and the best reasons for speaking correctly, should have been mistaken, or that they conspired to testify falsely, is out of the question.

True, it may be said: "This is but a minor matter; what is the difference whether it was the 19th or 24th?" Very little, in one sense, as to the results, but in all such matters it is better to be exact, and in this case it is as easy to be right as to be wrong. The magnitude of the results of that discovery justifies exactness, and, hence, it is here clearly shown, and forever put on record, that the date of the discovery of gold in California by Marshall was January 19th, 1848.

Self Ignition.

Oxygen, one of the constituents of air, is necessary alike to explosion and combustion. When street gas, or kerosene oil vapor, or even very fine organic matter, such as flour, coal dust, etc., is intimately mixed with air in certain proportions and a spark of fire applied, there will be an explosion like that of gunpowder. But the oxygen is as necessary as the spark of fire. Plunge a lighted candle into a gasometer of pure street gas and the effect will be the same as if it had been dropped into water. Liquid kerosene oil never explodes, and when the "lamp explodes" it is the oil vapor and air mixed above the oil that causes the mischief. A few years ago we read of a man who was repairing a gasometer lowering a light into the manhole just at the wrong time, namely, while there was still a little gas remaining, and the entire apparatus was blown up. Had it been full of gas alone he might safely have lowered his light into the place. Furnaces using coal-dust fuel would go out should the supply of air be shut off.

Prof. Pepper's interesting experiment along this line is worth giving in this connection. Take a box a foot square and containing a quart or two of fine flour, and nail thereon, for a cover, a fine wire netting, like bolting cloth, used by millers. Now shake this box at some open flame, like a burning stick, and in such a way as to send out a cloud of dust upon the flame. If the conditions are all right, there will be instantly formed an astonishing volume of flame resembling the flame from the burning of an open bunch of gunpowder. The flour, being largely carbon, will burn when mixed with air, about as readily as the coal dust in a furnace, or as the fine particles of coal floating in the air in coal mine explosions, to which most of the violence of coal mine explosions is now believed to be due. A pile of flour is harmless enough, but surround each of its particles with oxygen and apply a spark of fire, and the result will be an explosion. It is, therefore, always dangerous to go about a flour mill with a light of any kind.

Gunpowder is a mixture of carbon and oxygen in solid form, as seen from its ingredients, charcoal and saltpeter, the one supplying the carbon, the other the oxygen. Take out the saltpeter, and a harmless mass is left. In kerosene vapor we have an example of a still finer form of carbon, but in chemical combination, and in illuminating gas and air, an explosive mixture where the ingredients are both perfectly gaseous. A coarse mixture is comparatively harmless because of the difficulty of combining in burning. The form of the mixture, whether solid or gaseous, is immaterial, but the two elements, oxygen and carbon, are essential. True, other combustibles than carbon may be combined with oxygen to form an explosive material. Street gas is, in fact, partly hydrogen. There are a few other substances that will partially take the place of hydrogen, but they are usually experimented with in chemical laboratories, and need not be dwelt upon here.

Prof. Tobin demonstrates by experiments that dampness destroys the explosive tendency of fine organic dust, and he recommends that millers use the wet-bulb thermometer constantly in their mills, and on its indication of dryness to inject live steam into the atmosphere. And Prof. Baehr, of Dresden, has found that the leather belts used for the transmission of energy in mills are such rapid generators of electricity that finely divided forms of dust may be exploded thereby. Many fires have their source in self ignition. A package of lampblack has been known to ignite spontaneously and fire a building. Oily or greasy waste and rags have been seen to blaze up a few minutes after having been thrown on the floor. Dry rubbish exposed to the sun has been seen to take fire under circumstances which precluded any other possible cause. Sawdust around oily machinery journals has taken fire. Hay, heating in the mows, has taken fire and burned down many a barn.

Steam pipes will char wood touching them and fire will result. Hot-air pipes are equally dangerous in contact with wood. Ships that have a cargo of damp goods stowed away, such, for instance, as cotton in bales, are liable to be burned, for spontaneous combustion occurs just as well where dampness is as where only grease or oil is present. This is the reason why hay or grain stowed away while wet, or bales of rags or even heaps of bituminous coal, have taken fire spontaneously. Barrels of damp sawdust, often seen around certain factories, are always liable to cause a fire. Even moistened tin-turnings and chips have been known to take fire.

Recollections of California Mining Life.

Written for the MINING AND SCIENTIFIC PRESS.

ALTHOUGH THE grand discovery of gold in California occurred not until 1848, there were traditions of its existence here centuries before that time. For nearly 300 years the impression that this was a gold-bearing country obtained among both English, French and Spanish-speaking peoples, being founded on the reports of navigators along the North Pacific coast, magnified, as was their wont, by the chroniclers of these early times. In the summer of 1579 Sir Francis Drake, the English navigator, entered the bay which now bears his name, and anchoring his vessel remained there several weeks. Before departing he took possession of the country in the name of his sovereign, Queen Elizabeth, and called it New Albion. On his return to England, with a view probably to give importance to his new possessions, Drake represented the country as abounding in gold, so much so that Hakluyt, the historian, in speaking of it declares that "there is no part of the earth here to be taken up wherein there is not a reasonable quantity of gold or silver." Inasmuch as there is no gold or silver anywhere about Drake's Bay, which lies in latitude 38°, and thirty miles north of the Golden Gate, the above statement is clearly a fabrication of the great navigator. Had Sir Francis went ashore a hundred or two hundred miles farther north, where the gold bluffs and beaches occur, there might have been some ground for the representation so made. But as the bay called after him is as far as he voyaged in that direction, the existence of these auriferous deposits avails not to save his veracity from successful impeachment.

But this notion about gold in California did not originate with Drake and his contemporary historian. In the same year that he visited this coast a book was published at Lorraine, in which occurs the following passage: "The soldiers of Vasquirus Coronatus having found no gold in Vivola, in order not to return to Mexico without gold, resolved to come to Quivera (California), for they had heard much of its gold mines, and that Tatarraxus, the powerful King of that country, was amply provided with riches."

SCENE OF MARSHALL'S GOLD DISCOVERY.

After the conquest of Mexico the Spaniards, incited by the vague stories told them by the natives of the country, were ever engaging in expeditions off this way in search of the precious metals. And when these adventurers arrived in Arizona, here again the inhabitants gave them to understand that the gold-producing lands they were so eager to find lay still farther to the northwest. In so advising their unwelcome visitors these people might themselves have believed what they said to be true, though possibly this was a ruse to induce these marauders to move on and thus rid the country of their presence. Between the years 1610 and 1660 more than twenty expeditions were sent out from Mexico to explore and occupy the regions to the northwest, under the impression that they abounded not only with gold and silver, but also with pearls, diamonds and other precious stones.

How signally these efforts failed of their object is denoted by the fact that prior to 1848 only a few placers, poor and of comparatively limited extent, were ever found in California; so unimportant, in fact, were these gold fields that not much was ever heard of them outside the country and very little in it. The first of these placers, which was discovered by the Mexicans as early as 1775, is situated near the Colorado river, in the extreme southeastern angle of the State. Fifty-three years later deposits of free gold were found at San Isidro, 100 miles farther west, in San Diego county. In 1833 some little gold was gathered in the valley of the Santa Clara river in the northwestern part of Los Angeles county. Five years later the San Francisquito placers, located in the Sierra San Fernando, at a point forty-five miles northwest from the Pueblo Los Angeles, were discovered. These, the most productive deposits yet met with, were afterwards worked in a small way for a period of twenty years or more. The deposits at the other places mentioned, owing to their poverty and a lack of water in the neighborhood, were never much worked. And thus it was that, with all these legends and reports about gold in California, the country prior to the discovery at Sutter's mill produced very little of that metal—not more, perhaps, than $40,000 or $50,000 worth, all told.

SUTTER'S MILL WHERE MARSHALL FIRST DISCOVERED GOLD.

As it has been surmised that the Mexican Government was not well informed as to the existence of gold in California at the time that it parted with the country under the treaty of Guadalupe Hidalgo, it may be pertinent to state here that such was not the fact. The late Gregory Yale, in preparing his well known work on the legal titles to mining claims and water rights in this State, being obliged to make extensive research among early Spanish archives, discovered there the following document, showing that

the Mexican authorities were at that time not only advised as to the existence of placer mines in California, but that the extent and importance of these deposits were greatly exaggerated by the party communicating the information. This document, which

WHERE MARSHALL DISCOVERED GOLD JAN. 19, 1848.

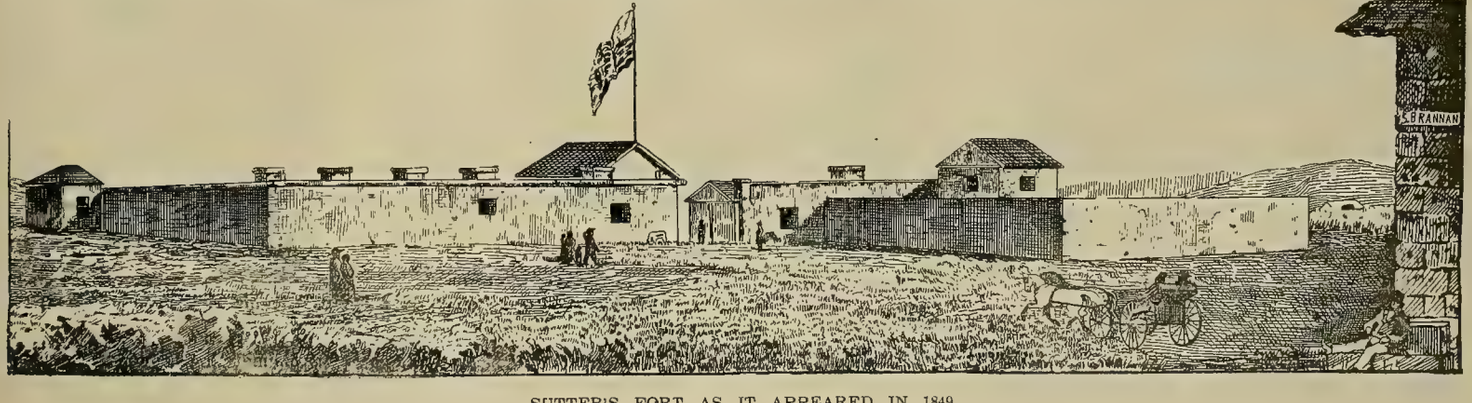
consisted of a letter addressed to the President of the Republic by Manuel Castanares, Representative in the National Congress from the Department of California, was published in the City of Mexico in 1845, though it bears the date of March 2, 1844, nearly four years before the Marshall-Sutter discovery of gold. The letter, translated for the above work by Charles G. Yale, reads as follows:

"The gold placers discovered in the course of last year have attracted the greatest attention, for they extend nearly thirty leagues. The good quality of this metal is made manifest by the certificate of its assay, which was made at the mint of this capital, and by the sample which I send to Your Excellency. In order to develop the great elements of wealth in which California abounds, measures ought to be taken only after mature deliberation. I therefore shall have the honor within a few days of presenting to Your Excellency a memorandum detailing these elements, and the means of developing them with very little sacrifice."

A few months later Representative Castanares addressed to the President of the Republic the following additional paper on the same subject:

"The mining interest in California is of great importance, and I have the satisfaction of assuring you that it forms one of the most valuable resources of that department. Besides the silver mines which are found there, and various other mines which have actually yielded metals, the gold placer, especially, is worthy of great attention, which, extending nearly thirty leagues, was discovered lately, together with mines of mineral coal. It is painful for me to have to confess that mining is in a worse state than agriculture; the latter is in its infancy; the former, it can be said, it is not yet born, notwithstanding that, according to the nearest estimate of reliable persons in Los Angeles, on my departure from that town in December, 1843, there were in circulation about 2000 ounces of gold, which had been extracted from the above-mentioned placer, the greater part of it destined to go to the United States. This metal contains, according to the certificate of its assay by the mint of this capital, which I sent to the Government at the beginning of this year, twenty-two carats two and a half grains of gold, fifteen grains of silver.

"September 1, 1844."



GOLD, AND PLENTY OF IT.

The foregoing, though a gross exaggeration of the real facts, establishes how thoroughly the Mexican authorities were posted as to any and all gold discoveries that had up till that time been made in California. Owing to various incidents and events connected with the acquisition of this country by the United States, and the efforts made by our Government for establishing steam communication with the Pacific coast, some have thought that the authorities at Washington had some unpublished advices in regard to the existence of gold here prior to the consummation of the treaty with Mexico and to their contracting for steamers to ply on the routes between New York and San Francisco. In support of this theory the fact is cited that within six weeks after the time that gold was discovered at Sutter's mill the treaty ceding to us this country was signed by the contracting parties, the Mexican Commissioners being ignorant of this important event and our Government affecting ignorance of it also. Then the vessels of the Pacific Mail Steamship Company were required to be ready for service by the month of October, 1848--just the time when the news of the gold find, having excited the more adventurous, had inspired thousands with a desire to emigrate to the new El Dorado. Pointing to this singular concatenation of events, it is argued that the American Government must have been actuated by some special reasons for hurrying treaty negotiations to a close, and for requiring the steamship company to have their first vessel ready to sail at this particular time. In the absence of any stronger evidence than the above, it is fair to presume, however, that officials at the national capital were no better posted in regard to the existence of gold in California than was the general public, the events cited being mere coincidences, such as might easily happen in transactions of this kind.

That the Government was in possession of more full and perhaps accurate information in regard to the mineral and other material resources of this country than the world at large is likely enough, as it would naturally take measures while negotiating the purchase of so much territory to ascertain something in regard to its probable worth. In the month of March, 1846, Thomas O. Larkin, then United States Consul at Monterey, in an official letter to James Buchanan, Secretary of State, writes as follows: "There is no doubt but that gold, silver, quicksilver, copper, lead, sulphur and coal mines are to be found all over California; and it is equally doubtful whether, under their present owners, they will ever be worked." In this expression of opinion, so temperate compared with the statements contained in the letters of Manual Castanares, our Consul may be understood to convey the idea that these various metalliferous deposits, until then so neglected, would be actively worked were the country owned by the United States.

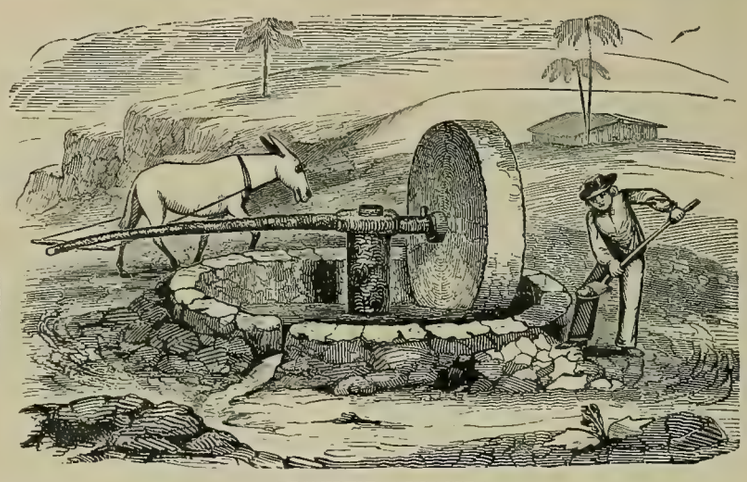
In 1841, James D. Dana, mineralogist to the exploring expedition under Commodore Wilkes, which that year visited this coast, made an overland trip from Oregon to San Francisco. In a book on mineralogy, published by him the next year, this author states that gold was to be found in the Sacramento valley, and that he had observed auriferous rocks in southern Oregon, but that he did not consider these deposits of any practical importance. That Consul Larkin, in his letter to the Secretary of State, was speaking in an indefinite way, having but vague ideas as to the extent or value of the deposits he alludes to, is evident from the fact that he makes mention of silver, quicksilver, coal and sulphur mines, concerning which nothing certain could then have been known. He had, probably, no more exact knowledge of such mines than was common to the inhabitants of the country at that day. They had observed in certain places indications of the presence of these metals and minerals, and surmised that there might be valuable deposits at these points. With regard to gold, Mr. Larkin could speak with more assurance, as small quantities of that metal had for a number of years before been taken out at the San Francisquito placers and brought to Los Angeles, where it was sold at the rate of about $20 per ounce. As these were the placers to which Senor Castanares must have referred in his communications to the Mexican government, the extravagance of his language in describing them becomes manifest, when we reflect upon their

SUTTER'S FORT AS IT APPEARED IN 1849.

limited extent and the sorry showing they have since made in the gold product of the country.

The foregoing comprises about all the knowledge extant touching the occurrence of gold in California prior to January, 1848.

Why Fremont Failed to Discover Gold.—Having related all that was known as to the existence of gold in California prior to January, '48, we come now to consider some of the principal actors in, and the circumstances that led to, that event. Before entering upon this subject it may, perhaps, be proper to state that some surprise has been manifested that John C. Fremont failed to discover gold at an earlier date, seeing he was sent out by our Government to explore the country, was accompanied by a competent mineralogist and geologist, and arrived here nearly two years before the find occurred at Sutter's mill. It is argued that, having been dispatched on such special mission, and being aware that some placers had previously been found and worked in the southern part of the State, he ought to have struck gold somewhere along his route, inasmuch as it led down the south fork of the American river, on which the great discovery was afterwards made. But to this it may be replied: General Fremont, with his command, consisting of sixty-two frontiersmen, scientists and guides, entered the country in an exhausted and famished condition, having been forced to slaughter his pack animals to save himself and his men from starvation, and to cross the Sierra in the dead of winter. He was, therefore, obliged to push on to Sutter's Fort with all possible expedition, and, having stopped there for a few days to recuperate his men and animals, he hastened forward to Monterey. Arrived at that place, then the capital of the Department of Alta California, the Mexican authorities, suspecting that Fremont meditated some revolutionary movement, at once attempted to drive him and his party out of the country. What with resisting this attempt and the active part he took in effecting the conquest of California, the great explorer had quite enough on his hands for the next two years without thinking about or hunting after gold. That General Fremont actually did make an important discovery of gold, and refrained from giving publicity to the fact, as a few have surmised, is, for obvious reasons other than the above, a hypothesis with hardly the shadow of a reason to rest upon.



PREPARING FOR A PROSPECTING TRIP.

General John A. Sutter.—The most prominent character connected with the epoch in California history under consideration, and the most noteworthy of all our pioneers, was born in Switzerland in the year 1805. Bred to the life of a soldier, after distinguishing himself as a captain in the armies of France he emigrated to the United States. Arriving at New York in 1834 he at once proceeded west, going as far as New Mexico, where he tarried for a time. Not liking that country and having heard much of California, he joined a party of trappers and crossed the continent, going, contrary to his intention, first to Oregon. From there he took ship to Honolulu, whence he voyaged in like manner to California. This circuitous route was taken to reach his point of destination for the reason that there were then no vessels running between Oregon and Yerba Buena, while the overland journey was not easily made. On reaching California our adventurer at once made his way up the Sacramento river, and there, near the junction of that stream and the American Fork, erected, in August, 1839, the fort that afterwards bore his name, he having been guided to this spot by the descriptions of the old beaver hunters, with whom it had been a favorite camping ground, and who had recommended it to him as an eligible site for an agricultural establishment and trading post.

This accomplished, Sutter engaged in carrying out his purpose of growing wheat and manufacturing it into flour for the Russian settlement at Bodega, and of raising horses and cattle on an extended scale. For effecting his plans, a flouring and a saw mill became necessary. The former, a large, three-story, frame structure, was built only a few hundred yards without the walls of the fort. The nearest place at which timber suitable for making good lumber could be obtained being on the South Fork of the American river, distant about thirty-five miles from the fort, Captain Sutter determined to up put a saw mill at that point. The business of getting out the timber and constructing this mill was intrusted to James Wilson Marshall, who, assisted by a small company of white men and Indians, commencing work in the fall of 1847, had the building about completed and ready for running by the end of that year. Marshall, who was born in New Jersey in 1812, and brought up to the trade of his father, a coach and wagon maker, emigrated, when about twenty-one years of age, to Indiana, where he worked for a time at carpentering. Leaving that State, he sojourned for a while in Illinois, whence he made his way to the Platt Purchase, in the State of Missouri. Here he engaged in farming and trading, and, being tolerably prosperous, made up his mind to settle permanently. But a severe and protracted attack of fever and ague shook this good resolution out of him, and, as a means of escaping the dread disease, he finally concluded to come to California. This determined upon, he made due preparation, and, joining a company having a train of a hundred wagons, left about the first of May, 1844, on his journey overland. As the safest way for reaching California, Marshall, with a portion of the company, took the route through Oregon, where they wintered, and starting out the next spring came on to California. Reaching Sutter's Fort in the month of July, 1845, Marshall there made a halt, working afterwards most of the time for Captain Sutter.

PRIMITIVE ARRASTRA.

PRIMITIVE ARRASTRA.

When the Bear Flag war broke out, Marshall joined the American party, and did good service in the field. Hostilities ended, he returned to the fort, and was soon after employed to take charge of the mill-building business, an enterprise that he had some time before strongly urged Captain Sutter to engage in.

Finding the Gold.—In regard to this event, there are several versions extant. All, however, agree as to the main facts, their differences relating for the most part to unimportant particulars. Marshall's account of this affair, which has been generally accepted as entitled to credence, is about as follows: Finding the race he had dug below the mill not quite deep enough, he had adopted the plan of hoisting the gate and letting on a full head of water, for the purpose of washing it out to a greater depth. Walking down the race one morning to see what progress he was making with this work, he noticed a small piece of yellow metal lying in a crevice of the soft granite, which at that point composed the bottom of the race. Picking it up, he began to ponder what it might be, having an impression from the first that it was gold. Its weight and the crude tests he was able to make of this metal—such as pounding it between two stones and finding it malleable—so tended to confirm this idea that Marshall thought it best not to say much about the matter just then, for fear it might cause the men employed under him to quit work and go to gold digging. But for all that, the notion that this metal might be gold gradually spread among the men, who failed not to notice that Marshall

THE MINER'S DAY OF REST.

PRIMITIVE METHODS.

continued to look after and pick it up, he having in the course of a few weeks collected from the mill-race several ounces of it. This incident, afterward fraught with such momentous consequences, occurred on the 19th day of January, 1848.

Peter Wimmer, who was with Marshall when he found the first piece of gold, had also gathered a small quantity. Taking a portion of this his wife, who did the cooking for the men, had subjected it to what was considered a crucial test, boiling it in a decoction of strong lye. As the stuff stood this trial with out tarnishing, it was concluded on all hands that it must be gold; and so a feeling of interest began to show itself among the employes about the mill, despite the efforts of Marshall and Wimmer to conceal the real facts and suppress the growing excitement.

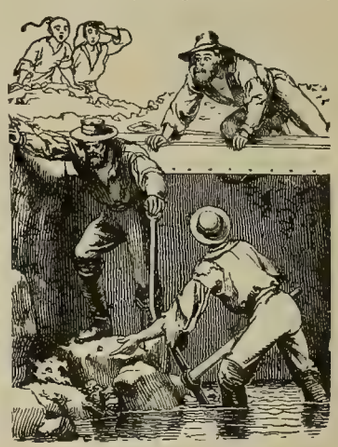
Meantime, Marshall having occasion to go to the fort, took some of the metal he had collected along with him and showed it to Captain Sutter, who proceeded to test it with nitric acid, whereby its true character was fully established. Comprehending the importance of the find, Sutter accompanied Marshall on his return to the mill, where he soon satisfied himself that the precious metal existed in such quantity as would be likely to work an early revolution in the then existing state of things. Nevertheless he found the men still at work, and affecting to treat the gold find lightly managed to keep them busied for some days longer, until the mill was fully completed and a small stock of logs gotten in.

By the time the news of the discovery had reached San Francisco, to which place a man named Bennett, one of the hands at the mill, had gone, taking some of the gold dust with him. Among others who happened to see this sample was Isaac Humphrey, who, having formerly worked in the gold diggings of Georgia, as soon as he beheld it not only pronounced it good gold but expressed the opinion that much more would be found where this came from. Such was the confidence of this Georgia miner in the new discovery that he left San Francisco about the end of February, and in company with Bennett went up to the mill. Arriving there on the 7th of March he found the men still at their work, none of them having as yet gone to gold digging. After prospecting a little with a pan, Humphrey constructed a rocker, such as he had been accustomed to use in Georgia, and commencing on dirt taken from the mill-race, washed out from one to two ounces of gold dust daily.

The News Spreading, and Its Effect.—The result of Humphrey's few days' washing put an end to all further operations on and about the mill. Work of every kind was in fact abandoned, all the whites in the vicinity building rockers and betaking themselves to gold washing. Even the mill, which Sutter and Marshall had so exerted themselves to complete, for a time stood idle. Getting in logs came to an end; building ceased; everything but gold digging was for the time being suspended. Everywhere, as the tidings spread, business came to a standstill. San Francisco was emptied of its adult male population. The American settlers residing in the valleys geared up their teams and set out for the mines, some of them taking their families with them. The rancheros and the vaqueros mounted their mustangs and started for the new El Dorado, driving their pack animals before them. And thus the country, before so quiet and inanimate, was now all astir; the whole population being moved by a single impulse—the eager thirst for gold.

So extensive was this movement, which may be said to have commenced about the middle of March, that there were collected in the mines before the end of the year as many as 10,000 or 12,000 men. While the most of these were residents of California, many of them came from Oregon, Mexico and the Sandwich Islands, with a few from Central and South America. As population flowed rapidly into the mines, so also was the business of gold gathering speedily extended over a broad stretch of country, having been in the course of a few weeks engaged in at widely distant points. Coming to Sutter's Fort about the middle of March, from his ranch at the head of the Sacramento valley, Pearson B. Reading visited the site of the new gold discovery. Finding the appearance of the country similar to that in the vicinity of his ranch, he returned home and, taking his domesticated Indians, was engaged before the end of the month washing out gold on Clear creek, nearly 200 miles to the northward of Coloma. John Bidwell, another large ranch owner in the upper Sacramento valley, having, in like manner, visited Sutter's mill, returned and went to work with his Indians on the bars of Feather river, nearly midway between Clear creek and Coloma. Towards the south the gold seeker also made his way, pushing out in that direction as far as the Tuolumne before the season was over; so that mining by the end of the first year was being pursued at intervals along a linear extent of more than 200 miles.

RECEIVING INTELLIGENCE OF CALIFORNIA'S ADMISSION INTO THE UNION.



"OLD TUOLUMNE" IN '53.

General Sutter's Account of the Gold Find.—Before going on to further notice the changed condition of things produced by the discovery of gold in California, it may not be out of place to say a few words touching the accounts of that occurrence as given by different parties who had some agency in bringing it about or were in a position to speak authoritatively on the subject. General Sutter's version of the affair, as imparted by him to the writer, varies but little from that of Marshall, as already recounted. According to General Sutter's statement, Marshall, leaving the mill some time near the end of January, 1848, came down to the fort, where he arrived towards evening wet and covered with mud, the day having been stormy. His visit was unexpected, as he had been to the fort not long before. After talking a little about other matters he told his employer or partner—Marshall always claiming to have been interested with Sutter in the sawmill business—that he had some important information to impart to him, so much so that he wished to see him apart and where no one could see or overhear them. Complying with his request Sutter took him into his private room, but having neglected to lock the door a clerk entered just as Marshall, plucking a rag from his pocket, was about to exhibit its contents. Alarmed at the interruption, he quickly replaced the package, and when the intruder left insisted on having the door to the apartment locked. This done he again pulled out the package, and undoing a much soiled rag exhibited two or three ounces of yellow metal, which he informed his employer he believed to be gold. Sutter was of the same opinion, and after reading a description of the metal in an encyclopedia which he happened to have at hand proceeded to experiment on the dubious material with nitric acid, whereupon he found it to be unmistakably gold. So much was Marshall excited over the matter that he declined to remain at the fort over night, but left at a late hour and in a heavy rain to return to the mill, after exacting from Sutter a promise that the latter would follow him in the morning, which he did.

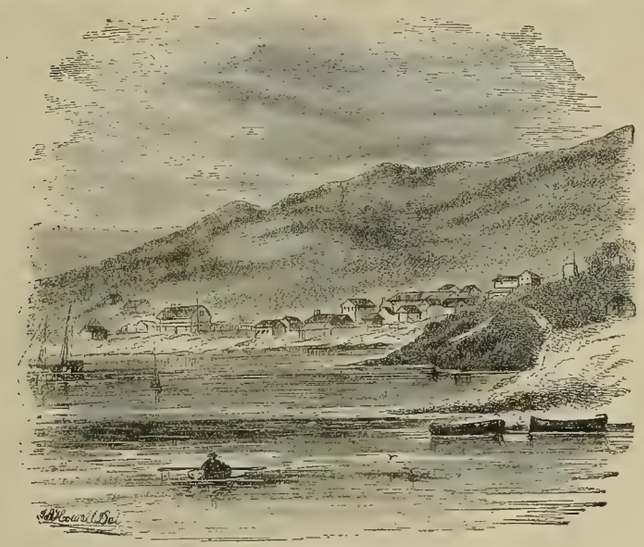
General Sutter relates that, despite the storm, which still continued, he started at an early hour the next day for the mill. While on his way, and when out about twenty miles, he saw, to his surprise, a man come out of the chaparral a short distance ahead of him. Riding up to the spot, he found this to be Marshall, who had already since leaving the fort been to the mill, and, there procuring a fresh

"WRITING HOME."

QUICK WORK NEEDED.

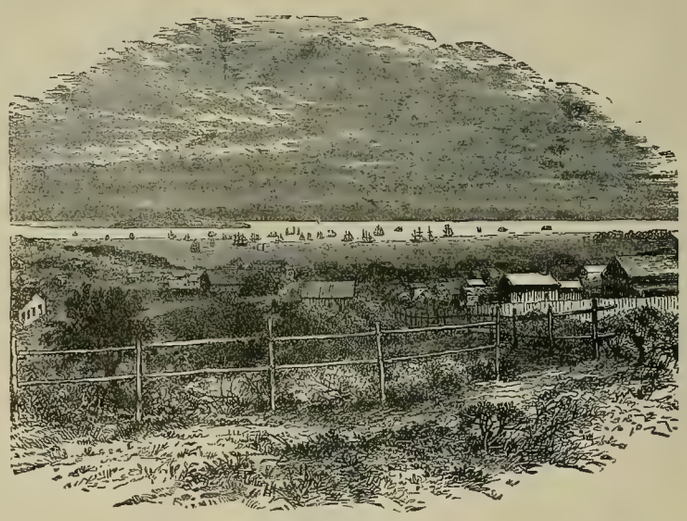
horse had returned thus far, when, overcome with fatigue and loss of sleep, he made a halt, crawled into the bushes and took a nap. When Sutter came up, having so refreshed himself and rested his animal, he had already gotten into the saddle and was about resuming his journey towards the fort. When interrogated as to his object in returning so soon, nothing very definite could be gotten out of him; the pretense that he had come on to meet the General and see that he did not miss the trail being evidently no part of his real purpose, as Sutter had already been over the road, which, being well marked by wagon travel, could not easily be missed. The truth was that Marshall had become so excited when it was shown that the stuff he had picked up in the mill-race was really gold that he could neither sleep nor rest until he had his partner on the ground and something as to their future course of action had been determined upon. Hence this speedy setting out again for the fort, the poor man in his anxiety fearing that Sutter, an easy-going sort of person, might delay his coming, or not fully appreciating the importance of the occasion, might fail to come altogether. This frame of mind on the part of Marshall sufficiently refutes the idea entertained by some that he was long in doubt as to the character of the metal he had found, and little conscious of the consequences likely to grow out of that event. He was not long in taking measures to confirm, what from the first he suspected, that the metal was gold, nor did he fail to comprehend the results that might be expected soon to follow.

On reaching the mill Sutter entered the race with Marshall, and walking down it picked up with his own hand several particles of gold. Adding these to some other pieces given him at the time by the workmen, he had a ring manufactured therefrom, on the inside of which was engraved the following inscription: "The first gold discovered in January, 1848."



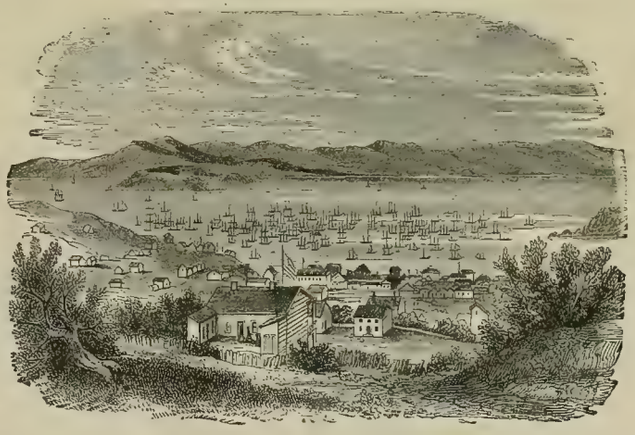
The First Piece of Metal Picked up by Marshall, and Mrs. Wimmer's Version of the Gold Find.—While the sentence as above inscribed was in some sense true, this ring of General Sutter did not actually contain the first piece of gold picked up by Marshall, though that is still in existence, and capable of being identified by many persons who at different times have seen and handled it. Owing to its size, shape and other peculiarities, persons who have once seen this piece of gold have no difficulty in recognizing it when shown to them again. It is rather flat, rough on all sides, of irregular shape and weighs about a quarter of an ounce, its intrinsic value being not quite five dollars.

Mrs. Jane Wimmer, wife of Peter Wimmer, who, as already stated, was cooking for the men at the mill, gives the following account of the discovery of gold, the circumstances under which it occurred and the history of the first piece of metal picked up: Her husband and Marshall, she says, were walking together down the race when they saw this piece of metal, both at the same time, though Marshall being a little ahead was the first to pick it up. Neither of them knew what it was, though both surmised its true character, her husband being so impressed with the belief of its being gold that he brought it to her and insisted on her boiling it in lye, which was accordingly done. After standing the test so well, Wimmer, satisfied that it must be a noble metal, urged Marshall to take some of it to the fort and submit it there to further trials, which the latter consented to do, Wimmer staying at the mill and looking after the men and the work during his absence.



Marshall carefully preserved this first piece of gold for a time, saying he intended to have a ring made from it for his mother. But finally, being about to go away, having taken out a good deal of gold dust, and fearing he might lose this first piece of gold, he gave it to Mrs. Wimmer, both as a souvenir and as a means of greater security against its being lost. This occurred in the summer of 1849, and Mrs. Wimmer, who is still living, being a resident of San Luis Obispo county, has retained the specimen in her possession ever since. Though not rich she has refused many liberal offers for it, being unwilling to part with it unless assured that it would be retained among the pioneers of California, or at least be kept in the State. Some years ago the Society of California Pioneers tried to treat with Mrs. Wimmer for this interesting relic, which, owing to a failure of negotiations, still remains in the hands of its long-time owner.

[The editor of this paper is authentically informed that the original gold nugget picked up by Marshall is now in the possession of W. W. Allen, 323 Phelan building, San Francisco.]



Their Fortunes and Their Fate.—And where are they, and how have they fared, these pioneers of the pioneers—what is to be said of them, these eyewitnesses of the great gold find—these men who were present at this new birth of California? Rich—millionaires, every one of them, we are ready to exclaim—very sybarites, living in palatial mansions, the recipients of that adulation and homage that large wealth never fails to inspire. In view of the great opportunities enjoyed by this first crop of the Argonauts, it would naturally be supposed that they had amassed riches beyond measure. But what are the facts? Unfortunately, quite the reverse of what the majority of mankind would expect, and very unlike what all could have wished them to have been. Not one of these men who were so permitted to skim the cream from the new El Dorado ever became rich; hardly any of them ever acquired, or at least retained, so much as a competence, while some remain, as others have died, miserably poor! Take for example the cases of Sutter, Marshall, Wimmer and Bennett, who figured so conspicuously in connection with the gold discovery: These men, though first on the ground, profited little in the end by that event—would have been better off, indeed, had it never occurred. It proved fatal to all, and especially so to Sutter, who, up till that time, had been successful in all his multifarious undertakings.

SAN FRANCISCO IN '47.

SAN FRANCISCO IN '49.

SAN FRANCISCO IN '48.

What worked the pioneers' downfall was this very discovery of gold, or rather the large and promiscuous immigration that it led to. That General Sutter was unable to cope with the sharpers brought hither by the inflowing tide, and who afterwards sought to circumvent him in every possible manner, or that he failed to protect his property against the rabble that tried to wrest it from him, proves nothing against his capacity as a financier or his efficiency as a business man. These new comers, with hardly more appreciation of the rights of the early settler than the Bedouins of the desert, squatted on his lands, dispersed his domesticated Indians, stole his cattle, and appropriated without compunction or stint whatever else of a useful kind they could conveniently lay hands upon. To contend with these hordes, armed with rifles and revolvers, and the still more dangerous instrumentalities of the law, would be like battling with a pack of ravenous wolves. That the hardy pioneer was despoiled of his property and finally vanquished in this unequal fight implies neither incompetence nor neglect on his part. Few men would, under the circumstances, have managed their affairs better, or resisted this system of wholesale despoilation more efficiently than did he.

General Sutter was in many respects a very superior man. His intellectual endowments were of the highest order. Physically he was equally well favored, being well proportioned and otherwise of great bodily perfection. He was highly educated, first in the schools and afterwards to the profession of arms, the versatility of his talents being manifested by the creditable manner in which he acquitted himself in both these callings. His aptitude for the acquirement of knowledge is evinced by the facility with which he read and spoke four different languages. He naturally possessed the instincts, and always, even in the midst of his rude surroundings, managed to preserve the manners and bearing of the gentleman, soldier and scholar. And yet, with so much to lift him above the common level, he was utterly without ostentation or vanity. Though learned and well acquainted with books, he was thoroughly practical, showing on all occasions the sagacious, enterprising man of affairs. He was the first to introduce anything like new ideas and modern improvements into California. Though he did not put up the first flouring or the first saw mill in the country, he was the first to erect establishments of this kind with a view to manufacturing flour and lumber for the general market. He was also the first to engage in the growing of wheat and the cultivation of the land on an extended scale.

The Testimony of General Bidwell.—General John Bidwell, himself one of the earliest, as he is also one of the noblest of the pioneers, bears efficient and kindly testimony to the high qualifications, personal merits and rich deservings of General John A. Sutter. In a letter written not long since to Captain William F. Swasey, and now in the possession of the Society of California Pioneers, General Bidwell, among other things, remarks as follows, his statements being here somewhat abbreviated: "General Sutter, when I first saw him in 1841, seemed to me the grandest man I ever met with. Of a fine presence and agreeable deportment he spoke German, French, Spanish and English fluently and well. As a conversationalist he excelled, being at home in the most refined and intelligent company. Yet he was not the least egotistical, but listened respectfully to every one, the high and low alike, and by his courteous manner making all with whom he came in contact his friends. He was a man of the purest honor and the strictest integrity. The California officials had such confidence in all he said or promised that when he sought land for a colony they readily granted all he asked for, and immediately put him in possession of the same. All who knew

were ready to trust him, the Russian Fur Company having sold to him, at the stipulated price of $100,000, but wholly on credit, their entire property at Fort Ross and Bodega. Becoming jealous of his growing power and exasperated at the partiality he manifested toward the American settlers, the Mexican authorities in California began at last to threaten General Sutter, going so far as to talk of expelling him from the country. When things had reached this pass Sutter advised these inter-meddlers that they had better refrain from threats of this kind as he was in a position to successfully resist any interference with his rights, and that if these menaces were repeated he might himself be constrained to act on the offensive, his main reliance in case this became necessary being upon the small number of Americans, not over fifty or sixty, then living in the vicinity of the fort or settled in the upper Sacramento valley. This defiant attitude of Sutter towards the departmental authorities having been reported at the national capital, Mitcheltorena was dispatched to California with 500 troops for the purpose of crushing out this growing spirit of insubordination, and, if need be, driving every American, Sutter included, out of the country. So far from accomplishing such task, this doughty commander, who was also appointed Governor, found it expedient to make friends with Sutter and his adherents, affairs having ultimately taken such turn that he who had come to expel others was himself expelled from California."

SAN FRANCISCO IN '49.

Continuing, our worthy informant goes on to remark upon the boundless generosity of General Sutter as manifested to all who, from sickness, misfortune or other cause, required assistance. No man, rich or poor, whatever his position in life or nationality, ever applied to Sutter for aid in vain. Whoever asked received, nor did he always wait for the suffering and needy to come and make their wants known. When he heard of an incoming immigrant train snowbound in the mountains, or suffering from want of food, he at once sent them provisions on pack animals, in barge of trusty men, these relief parties going sometimes far into and even quite across theSierra on these errands of mercy. All who arrived at the fort destitute were supplied according to their necessities, and this without any charge being made or anything said about future compensation. There being at that day no hotels or public houses in that country, all who came to Sutter's establishment desiring to stop were there entertained as free guests, however long they chose to remain. When General Bidwell and his companions entered the country, Sutter, hearing that there was a party coming in who were in need of provisions, forwarded them supplies while they were yet in the mountains more than a hundred miles away.

As a partial recognition of obligations for services so rendered, the Legislature of this State some years ago voted General Sutter a monthly stipend of $250, limiting the same to a certain number of years. On the expiration of this period this subsidy failed to be renewed. As a consequence, this fast friend of American institutions and interests in the Far West, this planter of the new civilization on the Pacific coast, the hardy explorer and typical pioneer, worn out with toil and weary with waiting, passed into the sere and yellow leaf of life, his last days pinched with want and clouded with sorrow. On the 18th day of June, 1880, the eventful career of the Switzer soldier was brought to a close in the City of Washington, whither he had gone several years before, in the hope of obtaining from Congress some slight compensation for the property of which he had been so unjustly deprived and the sacrifices he had made in behalf of republican institutions and the American people.

Through neglect and delay the ingratitude of California was paralleled by the injustice of Congress, which body, always professing a willingness to do justice to General Sutter, temporized until it was too late. Several members of the House, however, attended his funeral, and there was even a talk of having a stone placed at the head of the old man's grave. It would not indeed be at all strange if, after starving him to death, California should yet take measures to erect a grand monument over his remains. This is the way the world often treats its heroes!

The body of General Sutter, who was seventy-five years old at the time of his death, was taken to the little town of Letitz, in Pennsylvania, where his daughter resides, and there interred in the humble graveyard of the place. By his side his aged and estimable wife, since deceased, has also been buried.

As for Marshall.—Dating from the time of the gold discovery, the story of his life is briefly told. Having during the few months that followed that event collected considerable gold, some of it being a sort of tribute paid him and Sutter by the Indians, he concluded to leave the diggings, which he did. After a short absence he returned and again went to mining, at which he afterwards met with only moderate success. Tiring of this business, he betook himself to fruit and vine growing on a patch of land that he had always occupied near the mill, or Coloma, as the town that had here grown up had come to be called. Planting only trees and vines of choice varieties Marshall had here in the course of a few years the best nursery and vineyard in that section of country. Having lived here for some time in a comfortable sort of way he parted with this place, and afterwards does not seem to have had any permanent home or to have remained long in one place. For a time he lived in a cabin at Kelsey's Diggings, an ancient mining camp on the opposite side of the river a few miles above Coloma then. Latterly he sojourned elsewhere.

MINER'S CABIN.

On the morning of August 15, 1885, James Wilson Marshall, the discoverer of gold in California, was found dead in his bed in a cabin he had long occupied at Kelsey's Diggings, El Dorado county. From anything that appears to the contrary, he was in his usual health up to the night of his death, wherefore it is probable that he was carried off by heart disease, an attack of apoplexy or something of the kind. He was nearly seventy-three years of age at the time of his demise, having been born in the month of October, 1812, his birthplace being Hope township, Hunterdon county, New Jersey. He was buried on an eminence overlooking the town of Coloma, near the site of Sutter's sawmill, in the race of which the first piece of gold was picked up. The locality chosen for the interment of his mortal remains, selected by himself, is a fit one, as it was there the great event of his life occurred. Next to General John A. Sutter, Marshall occupies the most conspicuous place among the California pioneers. He died, as for the greater portion of his life he had lived, a very poor man, having belonged to that class of persons who, however favorable the conditions, never get rich. Why this is so cannot always be explained. Generally speaking, this class of individuals are deficient in some of the elements of business success, such as prudence, stability, economy, etc. He seemed to have been devoid of the acquisitive faculty; he was generous, given to acts of hospitality and prone to share what little he had with those in want.

It was unfortunate for Marshall that he came to be possessed with the idea that the world, and especially California, owed him a great deal. That this debt was not discharged, nor always even acknowledged to the extent he conceived to be his due, chafed him not a little, and so soured his disposition that he became at last somewhat querulous and misanthropic. The State of California did allow him a small pension of $100 per month, which, having been limited by law to a few years, at the end of that time ceased and was never renewed. It was a pitiful sum, just enough to wound the recipient's pride without being of much benefit to him. In the case of both Marshall and Sutter California has laid herself open to the charge of meanness, if not ingratitude, in refusing to grant these men a decent subsidy in consideration of the service they rendered the public. Far better would it have been for both had not an ounce of gold ever been found in the country, since in that event they would have retained the lands they once possessed, and been saved the humiliation and hardship of dying homeless and poor. As for Sutter, though perhaps in some things a little indiscreet, he had, by his boundless hospitalities to the early immigrants, and the splendid services rendered in the conquest of California, established such claims upon both the general and State governments as should have secured to him almost anything he requested at their hands.

Some of the stories related about Marshall, and one or two which are now being repeated on the occasion of his death, are at least apochryphal, if not wholly without foundation. For instance, what is said about people persecuting him with a view to forcing disclosure of rich diggings, of which he was supposed to have had a knowledge that he selfishly kept to himself; also, of his having been dispossessed of a large tract of land by the squatters, etc.; all of which is fiction. He was never the owner of or claimant to any large tract of land, wherefore it could not have been wrongly wrested from him. As to the story of his having had any knowledge of rich diggings that he refused to reveal for the benefit of others, that was still more absurd. Marshall, though the discoverer of gold, was not much of a prospector, having never gone far from Coloma in search of new diggings. The bar at Coloma, though extensive, was not extremely rich. The miners working on it as early as '48 averaged not much over one ounce per day to the man, the average earnings in '49 having been considerably less, while from that time on, till the bar was worked out, five or six years later, the average wages made were quite moderate. It is, therefore, evident that, as the old pioneer never made any very big raise at that place, so neither could he have had any knowledge of rich deposits there, as likely he had no knowledge of any elsewhere.

The truth is, the great gold find at Sutter's mill proved altogether an unfortunate event for Marshall. It lifted him above himself and his surroundings, caused him to lose his poise, and to let go his grip on the small and certain, and grasp to the grand, distant, and, as it proved in his case, unattainable. But for this untoward incident it is easy to see what sort of a life he would have led, and how he would probably have fared in the end. Having gotten his mill started, he would have gone on making lumber, from the use and sale of which, being in this business as a partner of Sutter, he would have, in the course of a few years, realized a competency.

Why the Early Pioneers Failed to Make Money.—Peter Wimmer, who was with Marshall in the millrace when he picked up the first piece of gold, though

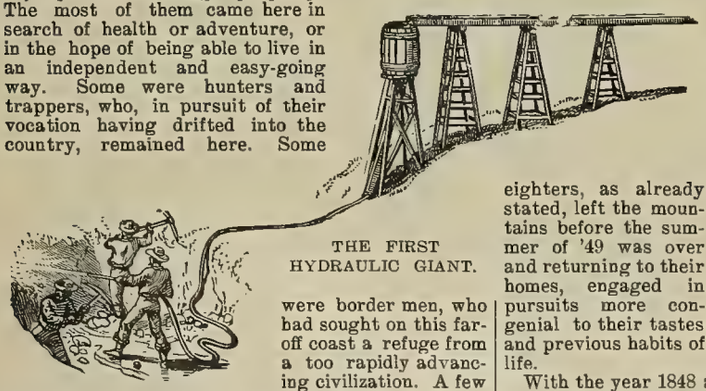
THE BEAR FLAG.

a man of good habits, industrious, temperate and possessed of fair business capacities, never succeeded in acquiring very much property, the extent of his worldly wealth consisting of a small piece of land in San Luis Obispo county, on which he and his pioneer wife are, or at least were, living not long ago. Bennett, who brought the first samples of gold to San Francisco, though far from being rich, is in comfortable circumstances, owning and living on a piece of good land in the vicinity of Santa Cruz. He left the mines in the summer of 1849 and never returned to them. Of the considerable number of white men who were at Sutter's mill when gold was discovered, none ever became rich, nor did any of them ever acquire more than a very moderate competence. Several are known to have died, if not in indigence, at least quite poor. Of the residents of the country at that time only a few afterwards became millionaires, and these were made such through the increased value of their landed possessions, or by their engaging in other than mining pursuits.

The causes that brought men to California at that early day were such as little qualified them for rapidly accumulating property. The most of them came here in search of health or adventure, or in the hope of being able to live in an independent and easy-going way. Some were hunters and trappers, who, in pursuit of their vocation having drifted into the country, remained here. Some were border men, who had sought on this far-off coast a refuge from a too rapidly advancing civilization. A few were run-away sailors or mariners, who, attracted by the beauty of the country, the excellence of the climate and the hospitality of the inhabitants, had been enticed into a long sojourn on these pleasant shores. Whatever the causes that brought or kept them here, hardly any of these pioneers had in view the acquisition of wealth; wherefore, none of them can be properly called Argonauts, using that term in its primary sense. They were for the most part a hardy, brave and generous set of men, whose habits being simple and their wants few, neither craved nor had any need for much money. The most of them left their homes early and, retiring to their former homes, never troubled themselves much with gold digging thereafter.

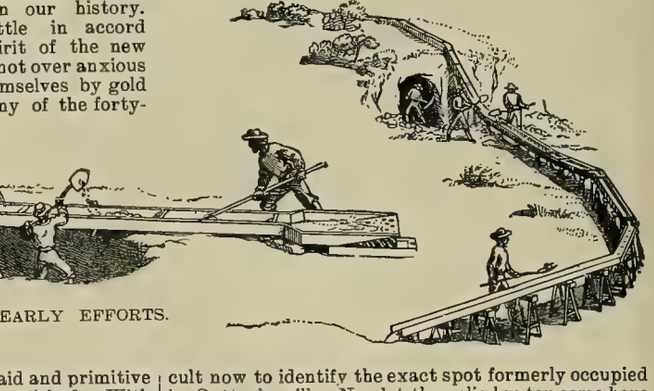
It hardly needs that the names of these old pioneers be even so much as mentioned in this article, seeing so much that is noble and good has been recorded of them in the great work of Hubert Howe Bancroft on the Pacific States and Territories. Embalmed in the pages of the historian, their memoirs will be handed over to an honorable and an enduring fame. "The Natural Wealth of California," by Titus Fey Cronise, contains also much that is interesting in regard to the lives and characters of these men, who, journeying far by land or water, came early to make for themselves homes in this borderland of the Great Pacific Sea.

The New Era.—Arriving at San Francisco in the month of February, 1849, the writer found the place crowded with miners, who, leaving the diggings at the commencement of the rainy season, had come to the city to pass the winter. A more motley crowd, or one composed of such divers nationalities, was, perhaps, never before collected in one place. Almost every civilized people on the face of the earth was already represented here. The Mongolian only, of all the races now in the country, had not yet put in an appearance, the worst coming last. San Francisco, although a very Babel of languages, and the scene of indescribable activity, had up till this time remained peaceful and orderly, crimes and even misdemeanors of a grave kind having been of rare occurrence. While the merchants were busy, and the public places were thronged with frequeters and patrons, the miners, unconscious of impending events, were taking things easy. Though current wages were an ounce per day, not until they got dead broke did these old timers seem disposed to seek or accept employment. By the time spring came around the most of them had got rid of their earnings, a good share of which had passed over the gambling tables. Early in March, and before more than a few of them had begun to think of returning to the mines, the advance of a new immigration had begun to arrive—an excited, eager, rushing crowd—who, going for everything within reach, soon relegated to the background their predecessors in the field.



THE MINER'S CABIN IN DANGER.

A GAMBLING HALL IN THE EARLY FIFTIES.



To such an extent, in fact, has the year commemorated by the discovery of gold come to be overshadowed by the stirring events that followed in its wake, that the year 1849 is generally accepted as marking the advent of the new epoch in our history. Being so little in accord with the spirit of the new comers, and not over anxious to enrich themselves by gold digging, many of the forty-eighters, as already stated, left the mountains before the summer of '49 was over and returning to their homes, engaged in pursuits more congenial to their tastes and previous habits of life.

THE FIRST HYDRAULIC GIANT.

With the year 1848 all that was staid and primitive in or about the mines of California vanished. With it ended the old civilization and the old scenes, new men with new ideas and different methods of doing business having come to take the place and accelerate the work of the first stock of pioneers.

Sutter's Mill.—The view given of Sutter's mill (see page 112) is taken from a painting by Nahl, and shows this famous landmark as it stood in the summer of '49 and for several years thereafter. The buildings seen in the background represent a hamlet that sprung up that summer on the opposite side of the river, the town of Coloma, farther to the right, not being shown in the cut. Having already made mention of the more interesting incidents connected with the history of this mill, it only remains to be said that it, like the baronial establishment at New Helvetia, has become one of the things of the past. But if the fort is so nearly gone, the very site of the mill has been razed. The rude structure itself has not only disappeared, but the ground on which it stood has been literally swept away. The dam, the race in which Marshall picked up the first piece of gold, the big pines standing fast by, as shown in the picture, are all gone, and in their place only piles of white boulders glisten in the sun. So changed everything, that but for the river, flowing as it flowed before, it would be difficult now to identify the exact spot formerly occupied by Sutter's mill. Nor let the relic hunter come here seeking mementoes or reminders of the past! The iconoclastic pick of the miner has spared none of these—not a stick or foundation stone or slab or splinter has been left. All is extinguished. Even the old town of Coloma has been nearly all washed away, the ground it covered having been sent down the South Fork.

SACRAMENTO IN '50.

SOME EARLY EFFORTS.

"CALIFORNIA OR BUST."

THE GREATEST PROCESS ON EARTH!

The New and Improved Cyanide Process,

As introduced by the AMERICAN Cyanide Gold and Silver Recovery Co.

COMBINING THE

Dioxide-Cyanide and Wiswall-Frank Precipitating Processes.

Unassailable United States Patents Granted.

CHEAP. SIMPLE. EFFECTIVE.

TITLE PERFECT.

NEW METHODS.

Scientific Chemical Combination Treatment on Each Lot of Ore.

PROTECTION GUARANTEED.

Higher Extraction, Shorter Time and Less Cost for Chemicals than any other Process.

Past Cyanide Failures followed up by Success and Profits.

OLD AND ABANDONED MINES AND TAILINGS can be Profitably Worked.

Mill Rights Granted and Mills Erected with Guarantee of Working Successfully and Profitably.

MANY TESTIMONIALS ON FILE. HERE ARE A FEW SAMPLE ONES:

"I have used the Dioxide-Cyanide Process in my mining operations in Nevada. By its use I am enabled at a minimum cost to save 95% of the gold, and 80% of the silver; in chlorination all silver is lost. I am now treating by the process on an average of 70 tons daily, and by 1st of May will be treating 200 tons daily, and I am satisfied that it is the best chemical process heretofore suggested."—*Capt. J. R. De Lamar, April 20, 1896.*

"After several months' experiments with your Dioxide-Cyanide Process on tonnage lots, we can testify to the efficiency, reliability and economy of your process By the plain cyanide process our best extraction was 71% of the gold and 30% of the silver, by percolation in 76 hours. By your Dioxide-Cyanide Process our extraction was 92% of the gold and 85% of the silver, while the period of extraction was only 36 hours. The consumption of cyanide was only one-half by your process. The many points of superiority connected with your process are very manifest. We can cheerfully recommend your process."—*Oliver P. Posey, Gen'l Manager Tom Boy Gold Mines and Brigham Gold Mines Co., April 19, 1895.*

"The addition of Dioxide of Sodium materially increases the solubility of the gold in cyanide of potassium solutions; that is, a higher extraction at a less cost for chemicals consumed when your process is used."—*Prof. Nicolai Anderson, Ex-Chief Chemist, MacArthur-Forrest Process, June 6, 1896.*

"Tests 1 and 2, at 20 hours leach, only 44% saved by the plain cyanide process, and 77% by the dioxide, which is equal to plain cyanide at 70 hours, thus saving 50 hours by the use of your process.

"I am very much pleased with the action of the new process."—*Test on a difficult copper ore by J. K. Turner, Chemist, Gibbonsville, Idaho, Jan. 30, 1895.*

"We have been operating on Bingham ores for about 12 months, the first quarter using only cyanide, the remainder of the time cyanide in connection with dioxide. While using plain cyanide, our extraction was not good for either gold or silver, and the consumption of cyanide was excessive. Tests with the addition of dioxide invariably gave us better extraction, and consumption of cyanide reduced over 50%. All tests show that the time is materially shortened by the use of dioxide."—*Supt. W. A. Stephens, M. E., Bingham, Utah, Mill, Nov. 16, 1895.*

The American Cyanide Gold and Silver Recovery Co. is one of the most substantial mining concerns in the world It permits the use of patented processes on royalty, operates mines and mills, and purchases tailings and ore. Its operations are on a large scale. One of these was the recent purchase of 150,000 tons of tailings in an old camp in California. They seem to succeed where all others fail. After the 4th of July they will put a force of men at work on Camas No. 2 tailings.

As intimated above, there is no proposition too large for this company. In fact, the larger it is, the better they like it, as they cannot afford to bother with small propositions.—*Wood River Times. Hailey, Idaho, June 28, 1897.*

The importance of the cyanide process in the reduction of ores is illustrated by the fact that there are now five cyanide mills upon tailings of old mills.

The American Cyanide Co. recently closed a contract for the construction of a 400-ton mill upon the Golden Gate Mines at Mercur, Utah, owned by Capt. De Lamar.—*Denver Daily Republican, April 28, 1897.*

The American Cyanide G. & S. Recovery Co. had a very successful year. This company operates the Dioxide-Cyanide Process, all covered by several U. S. Patents, whose validity is unassailable. Infringers are, therefore, liable to injunctions and damage suits.—*Daily Rocky Mt. News, Denver, Colorado, Jan. 1, 1897.*

Since the introduction of the cyanide process, many miners have attempted the construction of crude plants for the treatment of their ores, without, in many cases, having made an analysis of the ores, and with little or no knowledge of the most economical method or treatment, even when the ores can be treated successfully by skilled men. The results are frequent failures, and the consequent damning of a process which has become firmly established.—*Daily Denver Republican, August 17, 1897.*

We are constantly in the market for good mines and tailing dumps. Prices must be reasonable and propositions of merit. Write particulars and for literature with copies in full of splendid testimonial letters from mills operating in the mineral regions. Address

James W. Marshall.

Elsewhere in this issue appears a biographical sketch of the life of James W. Marshall, the man who on Jan. 19, 1848, discovered gold at Coloma, El Dorado Co., Cal. Of himself, on Jan. 28, 1865, he made the following statement before Ogden Squires, at that time Judge of El Dorado Co., Cal.:

"I discovered gold on the 19th day of January, 1848, in what was known as the 'Sutter mill race' at Coloma, El Dorado Co., Cal. There were at the time employed about the works, in the building of the mill, and the digging of race, beside myself, Peter L. Wimmer, last heard of as residing somewhere in Napa Co., Cal.; W. H. Scott, died at Georgetown, Cal.; Alex Stevens, went to Salt Lake; Wm. Johnson, went to Salt Lake; James Barger, went to Salt Lake; Israel Perkins, went to Salt Lake; James Brown, went to Salt Lake; Israel Smith, went to Salt Lake; Chas. Bennett, dead. Mrs. Peter L. Wimmer was residing near the mill with her husband, Peter L. Wimmer, with the children, Elijah Wimmer and John Wimmer, sons of Wimmer, and M. V. B. Baize, sons of Mrs. Wimmer, and a son of Mr. and Mrs. Wimmer, name not remembered.

"I, James Wilson Marshall, was born at Round Mountain Farm, Hopewell township, Hunterdon county, State of New Jersey, on 8th day of October, 1810. My father's name was Phillip Marshall. My mother's name was Sarah Wilson Marshall, her maiden name being Sarah Wilson, now living at Lambertsville, Hunterdon county, New Jersey, aged about seventy-six. My father's mother's maiden name was Rebecca Hart, daughter of John Hart, one of the signers of the Declaration of Independence from New Jersey. I left New Jersey, went to Indiana, remaining there a short time, then went to Illinois, remaining there a short time, then went to Missouri, remaining there seven or eight years, then, in 1844, crossed the plains to Oregon, remaining there until 1845, when I came to California, where I have ever since resided, at present, as most of the time heretofore, at Coloma, where gold was first discovered. I selected the site for Sutter's mill in May, 1847. I superintended the work. We commenced the work, I think, in August, 1847."

There have been several claimants to the honor justly the due of Mr. Marshall. Some time ago Oregon developed "a discoverer of gold in California." On the tombstone of Captain Charles Bennett in the Rural cemetery near Salem it is recorded "that he was the discoverer of gold in California." Of this Stephen Staats writes: "As to the gold business, it is related that Marshall picked up something in the race at Sutter's mill, not knowing what it was, and showed it to Bennett, who examined the same and pronounced it gold. 'Why, that is gold!' was his exclamation. And this is the simple story of the discovery that may be said to have transformed society and worked such wonders in the material development of America, if not of the world. But the circumstance was merely fortuitous, and anticipated the event only a few months at the most. Adventurous Americans were beginning to enter California and roam over its wastes, and their sharp eyes would have soon detected the shining metal. But Captain Bennett was the discoverer of gold in California, nevertheless."

The real story of the "discovery of gold in California" is told elsewhere in this issue, as related by Marshall himself. It seems strange that Bennett's name was never linked with the discovery in any prominent way, and it is rather late to get any acknowledgment of his claim. The only other names connected with the occurrence are those of Sutter, Peter Wimmer and Mrs. Wimmer. Marshall and Wimmer were together when the gold was found, the former picking up the piece of gold in the tail-race. According to their version, they thought it was gold, and, finding more, kept the matter secret several days. Bennett is not mentioned by them or others. Marshall's statement is confirmed by Mr. and Mrs. Wimmer, Sutter, and all the hands at the mill. Henry W. Bigler's diary or journal, the only written record, gives the date as January 24, 1848; but Marshall puts it at January 19, 1848. This confusion of dates is explained by the fact that Marshall and Wimmer kept the matter secret several days, and Bigler recorded it when he heard of it. None of the participants of the event mention Bennett in any way. The credit of the discovery doubtless belongs to Marshall, and always will. The State of California some years ago erected a statue to his memory on a site near the point where the old mill stood. Standing on a rounded knoll overlooking Coloma, the Marshall monument presents a fine appearance in the distance. The site, which was presented by Placerville Parlor of the Native Sons of the Golden West, is excellent. Marshall's figure represents him standing, with a nugget in his right hand, while the left points to the site of Sutter's mill, where Marshall first found gold. Marshall is represented as dressed in a slouch hat, shirt with sleeves rolled up to the elbows, and pants with legs inside of rubber boots. A knife in its sheath is attached to his belt on one hip, while a holstered pistol adorns the other. The figure is large and life-like. The monument is of granite and some soft rock. The granite is all right, and the

JAMES WILSON MARSHALL.

monument would have been a success had it been made entirely of this rock. It cost $5000. On the side is the inscription, giving the dates of the birth and death of Marshall, and the statement that he first found gold in Sutter's mill-race on the 19th day of January, '48. On the opposite side are the

THE FIGURE ON THE MARSHALL MONUMENT.

names of the commissioners in bold relief, so bold that it would indicate that the monument was erected rather to their memory than that of Marshall.

On the front is an attempt to bring out in relief the seal of the State, while on the back is a supposed representation of Sutter's mill, the race, and a miner taller than the trees surrounding him, trying to hold fast to a perpendicular bank and dig at the same time. Nature is kindly obliterating all this, as the material in which it is gouged out is crumbling away.

It was Marshall's discovery which led to the rapid settlement of this State and the greatest gold excitement ever known to this world. Nevertheless, gold had been found in California long before, and was known to the Mexican Government. In 1844 Manuel Castanares, representative in the Mexican Congress from the Department of Upper and Lower California, published in Mexico the fact that placers had been discovered, and officially called attention to their importance. He said that in 1843 there were in circulation in Los Angeles about 2000 ounces of gold, which had been taken from the placers near there. This had been taken out in 1842–'43. Who made the original discovery no one knows; but it was that of Marshall that started the "California gold fever" that resulted in the memorable "days of '49."

Electric Power Transmission in Southern California.

In addition to the two enterprises which are to furnish electric power to Los Angeles and other southern California cities, from the San Gabriel canyon and from the Santa Ana river, there is another extensive project under way involving the bringing of electric power from Kern river, in Kern county, a distance of 108 miles, which would make it the longest power-transmission line in the United States, and one of the longest in the world. It is proposed to erect a power plant on Kern river, in Kern county, at which power will be generated and electricity transmitted to Los Angeles, Randsburg, and generally to mines, mills, pumping plants and power-consuming industries throughout the neighboring districts. It is claimed that power from this source can be supplied in such large amount, at such moderate cost, and with such ease and convenience, even in the most isolated localities, that it should stimulate industrial activity generally, and render possible the installation and operation of enterprises in less favored localities which have heretofore been impossible, because of the difficulty of obtaining fuel, and the consequent excessive cost of generating power. As the upper part of the company's works lies within the boundaries of the Sierra forest reservation, it has been necessary to wait for legislation by Congress permitting the occupation of the reservation, under regulations of the Department of the Interior; and then to make elaborate and detailed surveys and maps, and file them, with a formal application to the department for right-of-way on the reservation. Until the granting of this right-of-way, no constructive work would be permitted by the Government, and the plans of the company have thus been unavoidably delayed.

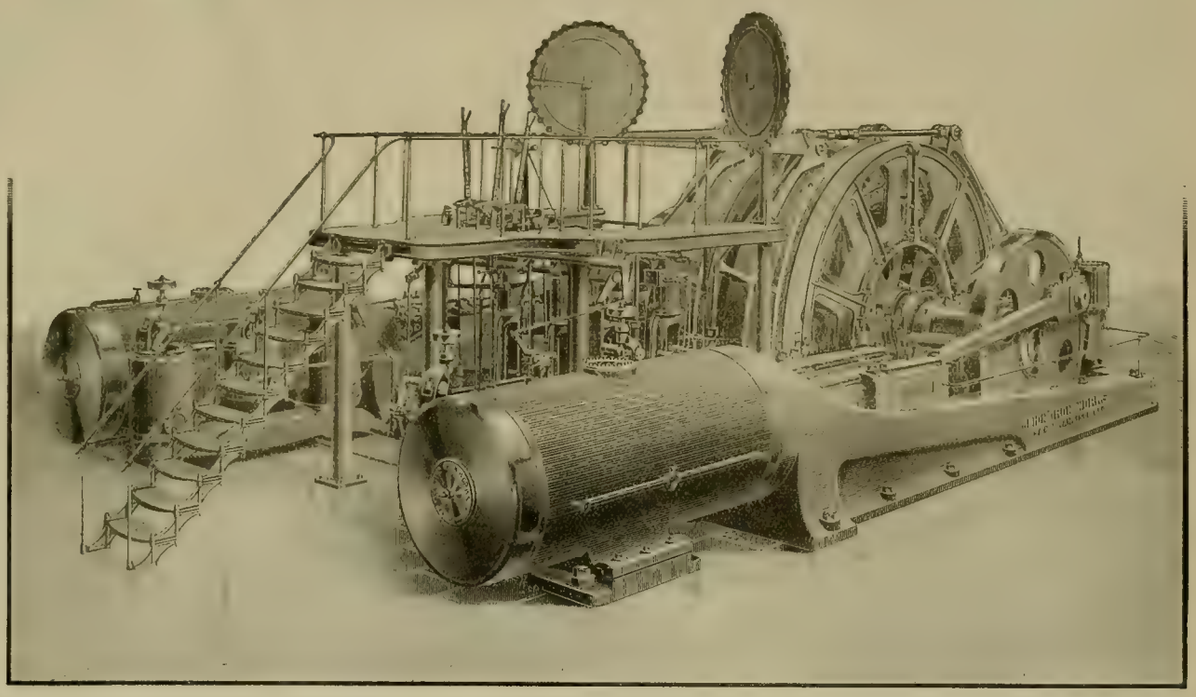
The Kern river is the largest stream in the southern end of the San Joaquin valley. Its flow exceeds in volume the combined flow of all the rivers between it and the Colorado. It drains an area of 2345 miles, lying chiefly in the most elevated portion of the Sierra Nevada, including within this drainage area Mt. Whitney, perpetually snowclad, and one of the highest mountains in the United States. The latent power of the river will be rendered available by suitable works constructed between the towns of Kernville and Havilah, the old county seat of Kern county. The plant that will be first installed will have turbines developing about 12,000 H. P. at the lowest stage of the river. The situation will permit of further power development to meet increased demands. From the turbines will be actuated the usual machinery of a polyphase system. The current generated by the alternators will be raised by step-up transformers to a voltage of from 20,000 to 30,000 volts, and at that pressure or tension sent over the wires to the different places of consumption. The greater portion of the power will be trasmitted to Los Angeles by a line of about 108 miles in length, passing through Havilah, Walker's Basin, Tehachapi, Elizabeth Lake, Lang's and Burbank to the north line of the city, where will be installed the requisite plant for reducing the voltage and changing the phase to suit consumers. As Prof. George Forbes, of Niagara power-plant celebrity, says:

"There is no difficulty or experiment in going to great distances; it is merely a question of expense, and of the value of power at the place to which it is transmitted. There are plenty of places in the world where it would pay to carry electrical energy 400 to 500 miles."

The Kern River Company's system includes the construction of a dam at the outlet of a natural reservoir site, and by this means the impounding of water to a volume of 42,000 acre-feet, the equivalent of 42,000 acres covered 1 foot deep, or 13,721,400,000 gallons. This water will be caught during the time of winter floods, and will not only abate their violence, but will afford sufficient water to increase the summer flow of the Kern river by nearly 50 per cent continuously during the period of low water, thus increasing the capacity of the company's power plant by that amount, as well as conserving the water supply of the whole adjacent district, and greatly benefiting the agricultural community below.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.



30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

Gold Dredging In Calfornia.

Subaqueous mining has been tried at various times, with varying success, in this State. The history of dredging for gold in California is, however, not as satisfactory a one as that of any of the other forms of gold mining within the borders of this commonwealth. In New Zealand the gold dredger has gone through the costly process of evolution, resulting in the survival of the most practical and profitable machine, and on one river, the Molyneux, in that country, sixty dredgers were last year in successful operation. R. H. Postlethwaite, who has had considerable experience in New Zealand river dredging, last year had built by the Risdon Iron Works, of San Francisco, Cal., a dredge on the Yuba river, in this State, of which two views are herewith given.

The machine is intended to dredge 45 feet deep, with a gross capacity of ninety-three cubic yards an hour. The dredge consists of two long pontoons, each 96 feet long by 9 feet beam, connected at the stern by a pontoon 17 feet long and 5 feet wide, the bow being connected by a heavy overhung beam, practically making one boat 96 feet long, 23 feet wide, with a well-hole 5 feet wide running through the center for some 75 feet. The ladder, 67 feet long, is hung at the stern end by a bar fixed across a heavy wooden framing. The lower end of the ladder carries a five-sided tumbler, and is suspended by blocks and tackle to a cross-beam. By means of wire rope and blocks, the winch can raise or lower the bottom end as required. The top tumbler is carried by the timber framing some 3 feet above the top end of the ladder. The continuous bucket chain comes up the top side of the ladder on roliers, round the top tumbler, and back in a catenary curve to the lower tumbler. The top tumbler is driven, through a rope transmission an pheavy gears, by the engine, a vertical compound condensing one, which also drives the pump, and indicates about 35 H. P. The material discharges from the buckets into a delivery plate, down which it shoots into a revolving screen or grizzly. The centrifugal pump, throwing 3000 gallons per minute, supplies water

IMPROVED RIVER GOLD DREDGER—CAPACITY 2000 YARDS PER DAY.

IMPROVED RIVER GOLD DREDGER—CAPACITY 2000 YARDS PER DAY.

to a perforated pipe inside the screen, washing the material, the finer wash dirt and gold going through holes in the screen and falling into a distributing box. From the distributing box it passes on to a set of gold-saving tables, 11 feet wide, thence into a flume. Speaking of this machine, the builder says:

"Any ground which is not deeper than 60 feet below water level, or more than 20 feet above, and which contains boulders of not more than say one ton weight, can be handled at from three to five cents per cubic yard. The ground need not be in a river, provided the seepage is sufficient to float the dredge and keep the water clean enough to wash the dirt with."

The Risdon Iron Works has bought the patent and the right to build the dredge referred to.

The engraving on page 109 is from an original drawing of the premium battery of 1858, for which a gold cup was given. It was shipped from England for the Agua Fria Co. and erected at Grass Valley, Nevada Co., Cal., by Melville Atwood.

What Would Have Come of a Goldless California?

The Sutter-Marshall discovery of gold in California has had so much to do with the shaping of her subsequent career that one is prone to speculate as to what would have been the probable fortunes of this country had that event never occurred. Many there are who believe or affect to believe that California, by reason of her climatic attractions and her other natural advantages, would have become rapidly populated, and even made astonishing progress in other respects had no gold ever been found here. In support of this view we are reminded that a considerable emigration from the Western States had, as early as 1846, set in toward the Pacific coast, and that California, having a little later come into the possession of our Government, that emigration would, in any event, have been swollen into large proportions. The people who arrived in the country at that day consisted mostly of families who, bringing with them their worldly all, came here to make permanent homes. They left the Western States because of the severity of the winters, the frequent failure of the crops, and the prevalence there of the fever and ague, a malady from which most of them had suffered terribly. Finding in California such entire exemption from these evils, it may well be supposed that these people entertained no purpose of ever going back to their old homes to reside. As evidence of this we are told that the immigrants who reached the country while it was still under Mexican rule proceeded at once to obtain grants of land and settle upon them, they who arrived after the American occupation showing the same disposition to take up land and improve it for homesteads.

Very different was it with the immigration that arrived here after the discovery of gold. Few came to stay. During the twenty years following that event not ten per cent of all who came to California remained permanently. As a consequence, while the arrivals were many, the fixed population of the State grew slowly. Substantial improvements were retarded, nearly everything being done in a hasty and slipshod manner. Extravagance, improvidence and waste prevailed. Even in public matters was this the case, few having the true interests of the State much at heart. Out of this condition of things grew lawlessness, crime and a generally low standard of morality.

While it is possible that affairs might have taken a fortunate turn even though no gold had ever been found in California, the probabilities are that they would have resulted differently. It may be admitted that these emigrants from the malarious West, once in California, would have remained here. Also, that the movement so begun would have been kept up for a long time, and perhaps even to this day. Then, too, the slight immigration from Mexico, Central and South America, the Hawaiian and other Pacific islands, already in progress, would, no doubt, have been continued, and perhaps augmented. That the ubiquitous Chinaman would, in time, have put in an appearance may well be supposed. The number of runaway sailors, constituting always in the seaport towns a considerable percentage of the foreign population, would have grown apace, while the Mormons, who had sought on this coast an asylum before the era of gold, would have arrived in larger numbers than they did had that event never occurred, inasmuch as it tended to defeat the object they had in coming here.

Beyond peradventure there would, by this time, have been gathered in California a large population, had the gold find at Sutter's mill never happened. But, while so respect able in numbers, what sort of a people, let us ask, would have come of this strange agglomeration of races, the inferior so largely predominating? What sort of a civilization would have been developed through the mixing up of the pure Castilian and the Indio-Spaniard with the Western frontiersman, the Kanaka, the Mongolian and the Mormon? Little in the way of social, educational or industrial advancement could have been expected of a society so made up, there being present in this hybrid community too little of the American element to give shape and direction to public affairs or deeply impress American ideas on the institutions of the country. The native Californian with his few wants and his narrow ambitions being first on the ground and numerically in the ascendant, the habits and business methods of all would have largely conformed to his standard. Everything would have been performed in a slothful and dilatory way, nothing being done to-day that could be put off till to-mrrow, and nothing being done at any time that could possibly be avoided. The country, instead of being filled up with a thrifty, enterprising, wideawake people, would have been sparsely inhabited by a listless, procrastinating, ease-loving race, who to any appeal for haste, would have answered according to the established custom of the country, "*manana, senor, manana*," everything going on as in the olden time with its *dolce far niente*—sweet laziness!

Mining Summary.

Production of Precious Metals in '97.

Following is Wells-Fargo's annual report of precious metals produced in the States and Territories west of the Missouri river (including British Columbia) during 1897, which shows in the aggregate: Gold, $69,830,597; silver, $37,184,034; Copper, $36,645,694; lead, $9,775,144; total gross result, $153,435,469. The commercial value at which the several metals named herein have been estimated is: Silver, 60 cents per ounce; copper, 11 cents per pound; lead, $3.38 per hundredweight.

"Allowance must always be made for probable variations from reported figures, by reason of constantly increasing facilities for transporting bullion, ores and base metals from the mines outside of the express and the difficulty of getting entirely reliable data from private sources. Estimates obtained in this way are liable to be exaggerated, and are, to a considerable degree, guesswork; but with some modifications on this account, made herein, the general results reached, while only approximately correct, may be accepted as the closest approximation possible under the circumstances."

		5,000	309,717	1,800	316,517
		27,500	31,000	2,500	61,000
		1,291,940	45,000	1,160,000	5,407,725
		371,972	70,000	3,623,000	4,064,972
Totals	$55,800,374	$14,091,223	$32,378,200	$51,325,582	$153,435,469

The gross yield for 1897, shown above, segregated, is approximately as follows:

Gold (45 51-100)	$69,830,597
Silver (24 24-100)	37,184,034
Copper (23 88-100)	36,645,694
Lead (6 37-100)	9,775,144
Total	$153,435,469

The year's combined product of the metals herein treated of is the greatest in the history of the country, that of gold $69,830,597, being above any previous record officially reported, and the world's output of gold for 1897—approximately $240,000,000—is surprisingly large and more than 10 per cent greater than estimated by them six months ago. The most notable increases have been in the British Possessions of the Northwest, Australasia, South Africa, the United States of America and Mexico.

Exports of silver during the past year to Japan, China, the Straits, etc., have been as follows: From London, $37,255,807; from San Francisco, $11,-158,202; total, $48,412,009; as against $44,102,381 last year. Pounds Sterling estimated at $4.8665.

CALIFORNIA.

Butte.

At a meeting last month in London of the Golden Gate of California, Limited, preliminary notice had been given for the purpose of considering resolutions to reconstruct the company, that the company be wound up voluntarily and a liquidator be appointed, and he be authorized to consent to the registration of a new company, under the name of Alluvial Gold Mines of California, Limited. W. A. Ellis (chairman) said: "Most of you are aware that the company is in possession of two distinct properties, one being the Petewood, which is the old bed of a lava-capped river, to which I will refer later on; the other being the as yet unexposed bed of the Feather river. With regard to the latter property, which we have owned the longest, we have made inquiries at a very recent date, and our general manager informs us that he has not the slightest reason to doubt his ability to turn that river, and to recover the gold from its bed. We have also affidavits, as you will find in the report, to the number of twenty-two, from men who have lived in the neighborhood, some of them forty-seven years and none of them under forty years, and in every case those affidavits state that this part of the Feather river has never been worked, and the conformation of the ground shows this to be so. We ourselves had very great difficulty in getting to the river bed, with our very much more extensive appliances and works than any of the old miners could have possessed. When you consider that in combination with the affidavits we now possess, and which any one can see at the offices, you will be convinced that in that river bed we have perfectly virgin ground. The only question is the cost of working, and as to that we have received from our manager an estimate which shows that if it were decided at the present moment to undertake the working of that portion of the Feather river, it would involve our making a call upon the shareholders of something like 11s. or 12s. per share, which, of course, would be out of the question. We have a very small capital, and it is for this reason that undertaking works of such a magnitude would involve so large a call, though with the capital of most mining companies it would be a mere trifle. There are advantages of having a small capital like ours, but there are also disadvantages. The directors came to the conclusion that they must turn their attention for the present solely to the other property, and leave the development of the Feather river bed until a future time, which we hope will not be long delayed. Then we trust that either from our own profit, or from some other source, we may be able to work the Feather river bed. When we do, I am perfectly certain that the returns will be phenomenal. In the meanwhile we have to devote our attention to the Petewood claim. Since our report was issued, we have had one from our general manager, which I will now read:

"I have just returned from the Petewood mine, near Coutolenc, and have pleasure in reporting that the main gangway is now in 1350 feet, and for the last 300 feet is in gravels that prospect from 50 cents to $2 a car, some portions of the gravels being richer than other. I am pleased to report that the gold is getting much coarser, and the gravels now contain a larger percentage of heavy boulders, and from other favorable indications I am inclined to believe we are nearing the head of a break-out from a channel that at one time followed the main ridge. Unfortunately, this mine was opened in the early days in a very crude manner, and the main gangway had been driven a considerable distance without any idea of keeping same straight or effecting a uniform grade, and, owing to this fact, the cost of handling the material is so heavy that nothing but gravel carrying over $1.50 to the car can be made to pay. The gangway is more than double the length it should be, and this, together with its snake-like course, makes it impossible to handle more than from forty to fifty cars a day, while with a tunnel constructed from a deep gulch on the property we could tap the same gravels with a length not exceeding 560 feet, by means of which, on regular grade with two tracks, it would be easy to handle as high as 300 to 500 cars per day. One thing certain is that the gravels through which we are passing are payable if handled in quantities, and it is possible at any time to strike a rich lead, more especially after having found such coarse pieces of gold during this last month. By Wells-Fargo Express Co. I forwarded you last evening about fifteen ounces from this month's clean-up, to show the kind of gold we are getting, and, without doubt, by systematically working the gravels rich returns will be obtained. In conclusion, I have to state that, from the nature of the gold we are getting, the kind of washed and well-worn material through the gravel, together with the bedrock indications, we are likely at any time to open up a rich mine, and that even now with a shorter tunnel the present ground could be made to yield a large profit. You may rest assured that you possess a valuable property in the Petewood mine; the gold such as that sent you is sufficient evidence of this fact."

"Mr. Evans," continued the Chairman, "estimates it will take five months to drive this new tunnel. To complete everything will cost about 3000£, which is an extremely small sum to require for opening up a property of this size. We also believe that this is a continuation of the famous Indian Springs channel—a property which yielded a profit of over $5,000,000. We ourselves have over miles of channel.

"In the notice we have referred to the new company as 'The Alluvial Gold Mines of California.' At first we thought it well to change the name, though personally I was sorry to do so, and was glad when one or two of the larger shareholders begged us not to change the name. I shall be pleased to adhere to the old name, of which we have no reason to be ashamed. We propose to adopt the same name as at present—Golden Gate of California. We have proxies representing 60,000 shares, and as our capital is only 80,000£, we have much more support than is required by the laws of California. The details of the scheme have been laid before you. We propose to call up 6d on application and 6d. on allotment, and we hope and believe that this will carry us on to the time when we shall be making returns, though, of course, I cannot guarantee this." The proposition was agreed to.

THE KLONDIKE.

Under date of Dec. 7th the following is received from Dawson City. It gives a good idea of the present condition of affairs in the Yukon:

A good dog train—about five or six dogs—will make the trip to the head of Lake Bennett in about twenty-five days, and pull 300 pounds and two men. They use sails when they can. You would be surprised at a dog team. A dog will pull as much as a man. Good interior dogs are hard to buy at $150 to $200 each. Dog feed gets as high as 40 cents per pound. Dried salmon is the best feed for dogs or man in this country. It has been all bought up; cannot get a bit here. Moose meat is same as beef—at $1 to $1.25. Quite a number have been killed twenty-five to thirty-five miles away. They are as large as a horse.

Coming in, we landed at Skaguay with lighters on the beach. We had to work in line handling goods; a hard job; then hustle them above tide. The tide rises 17 feet; runs up the beach for over half a mile. There were three or four wagons there that made $80 to $100 per day. Then the town was all tents, excepting two houses. When we left the train there were nearly fifty houses, most all frame, and 3000 to 4000 people. I have heard since it is quite a city, and was hurting Juneau. Then, after getting our goods above tide, we hired wagons to haul them to the foot of the hill; 3 cents per pound for three or four miles. Here the —— packing commenced. On a good, tough hill we packed one day, and then hired a man. We finally had five men packing for us at $6 per day and board. We paid for packing about $550. When Holderman went ahead to build the boat I had to let the men go for want of money, and pack'd it alone. I moved the whole cache by somebody I could trust; only lost some bacon and one sack of flour. Some lost 1000 pounds. The stove is smoking and the tent is full of smoke. The tent is covered with frost. I think it will be 20° below in the morning.

Well, Skaguay trail again! To gain time after crossing the summit, which is one of the easy hills, we went by the lakes—Summit, seven miles; Middle, five, and Shallow four. This saved us about ten miles and cost about $65. We landed our boat in Lindermann, but had to pack about one mile at the foot to Lake Bennett. Here I met Mr. Wood first. Run the boat over the rapids, called a few leaks and then loaded her at the head of Bennett and started across twenty-one miles, in a snowstorm and head wind, camped at night and went out of here as fast as a horse could trot the next forenoon. The waves were six feet high. We had dinner at "Caribos Crossing" and got into Lake Tagish soon. We got to the "Windy Arm" about 4 o'clock and started across it. Oh, but she was rough! We went to the left of the island. (Should have gone to the right.) Saw rocks near us that were so low that you could not see them if it had been smooth. The wind was fierce and we had to make three tacks to get across. The white caps came in the boat and kept one man bailing. We finally rounded the point about 6:30 o'clock into calm water, and a good camping place, the three happiest fellows you ever saw. It was a close shave, and I will never forget "Windy Arm" on Lake Tagish. We went out of Tagish about 11 o'clock the next day and found the custom officers waiting for us. They robbed us of $61, and we went through the river and were into Lake Marsh before night. The lake was fine—a nice sailing breeze and straight ahead; was soon into the river the next day and at night at the canyons. Ran the canyon with an empty boat. It took three minutes for three-fourths of a mile, but had to pack goods one mile. Then came "White Horse Rapids!" Paid a man $10 to run our boat with about 500 pounds in it; packed goods one and one-fourth miles. With a good boat 25 or 30 feet long both of these can be run loaded without danger. She may be in the air part of the time; but keep her straight and send her as fast as possible (which is about twenty-five or thirty miles an hour), and there is no danger. Next is Sixty mile river. The current is six to eight miles per hour. Then the big lake of all—"La Barge." We rounded it against a strong wind and started close to the left shore. It took forty-eight hours of the hardest rowing we had, then another swift river to "Five Finger Rapids." We did not stop; took the right hand opening and went a-flying, and was into "Rink Rapids" and through it in one hour into the Lewis river (it is the Yukon). We came down it good and fast to the Pelly river and stopped at Fort Selkirk.

Just a word more about the trip. It was high water when we came; always is at that time of the year, and is always low in the spring, and, of course, more rocks, but the months of February and March are the best times to come. March is about right for the "Dyea Pass." A man can walk along with from 250 to 300 pounds on a sled, excepting 9 00 or 1000 feet going up the top of the summit, when he can use a rope and pull, but at that time of year a man wants smoked goggles and a couple of heavy black veils. The sun burns until lips and nose are like liver. Also ice creepers and good sleds with double enders, with about one-half inch rocker build are the best. The best bed I have seen here is a swan's down sleeping bag; weighs ten pounds and costs $25. It is as good as two pair of Mackinaw blankets, and is warm enough with a rubber blanket under it, excepting in the coldest weather, when they wrap a Mackinaw around it, or a well lined fur robe is better than blankets—a good large one.

In the grub line, get everything condensed that can be bought that way, sugar, etc. Do not forget warm footwear, mucklocks, etc., also mits. Heavy fur coats are considered a good thing to freeze a man to death, except he is riding. It makes him sweat, then he chills easily. The man who will take this out—Harry Coyle—is going out with dogs 30 or 40 miles per day, and will be back in March with horses and sleds loaded with flour, oysters, etc. A sack will bring him near $100. It is a hard trip, but he drove a dog team for three years for the Hudson Bay Company.

Since I wrote the last page of my short letter I have been looking for all the news I could get concerning the different mines around here, but I have not learned very much, excepting that the prices are higher on most of them. McDonald's mine on Eldorado he holds at $750,000. I guess it is worth it, and some others above half a million. Claims along here that are about one-fourth prospected are held from $5000 to $15,000, but Bonanza and Eldorado both will be thoroughly prospected this winter. It has not been cold enough, but now it is 16° below, and was 32° a couple of nights ago. The claim below us, No. 35, is taking out 6 feet of dirt that runs 35 cents per pan. If ours does as well we can make good wages, after giving 50% to the owner. Some parties have been buying claims on this creek down where it empties into the Klondike, to take out and sell.

No prospecting has been done, excepting by a few of them could not get a color on some of them. They are considered worthless. I heard that one of the claims on Indian river are proving good. The law allowing 100 feet on gulch claims is being enforced. They let them take 200 feet, but tell them to do all their work on the end nearest (discovery). This leaves alternate 100-foot claims to the Crown. The Gold Commissioner says he will not take them unless he has to, but the people do not believe it, as the law has already passed the Common Parliament. This will cause hundreds to go into Alaska next year. People are sick of these and other laws, the 20%, etc. Next year early, when the $100 is due to the Crown, hundreds of claims will be dropped, then put up at auction and sold by the Commissioner; then will be the time to buy claims. I will keep a tab on the different creeks as well as I can, so if you do come in it can be of great help to you. I want to go out prospecting as early as I can in the spring. Every good and no-good is taken around here, except a few bench claims that are left. I may take one of them.

It costs $1 per letter to send mail out there to you. Do not know that it will go. I saw a fellow going out at Fort Selkirk that had lost fifty letters. We got there October 2. Stopped and helped Jack Dalton (Dalton Trail) kill forty-seven head of cattle, and bring them and 100 head of sheep down on three rafts—$10 per day, and all the beef we could eat. It tasted good after two months on bacon.

By the way, I am writing by a dip (bitch) of bacon grease. Candles are $1 each, and we have only two boxes and will need them for drifting. It took us nine days to kill and land at Dawson. They sold for $1.25 and $1 hind and fore-quarters. Dressed about 700 pounds each. Dalton had sent several rafts before; he clean'd up nearly $50 000 on cattle in five months. Mr. Wood caught us two days out from Selkirk. I called him ashore, and Dalton hired him, so he came with us and is with us yet. We are building a cabin on claim 34, Bonanza gulch. Have taken a "lay" (lease) 100 feet. The claims are 500 feet up and down the gulch. A lay is about 50 feet, more or less; generally 50 feet for two men. Bench claims are 100 feet square. We expect to begin sinking a shaft in a day or two. It will be about 20 feet deep here, and will take ten days. The hole is 3x6 feet, frozen from top to bottom; has to be thawed all of the way. The weather is the best it was ever known here. At Selkirk it was 10° below one morning; then got warmer. The coldest here was 26° below. It has been above zero most of the time since. We have got a stove in the tent and are very comfortable. These British laws are funny; you get a permit to build a cabin and cut wood, and then you can go on any one's claim and do both. The claim owner does not own anything but the gold on his claim, and he has to pay $100 per year. I saw Mike Cassion and the Elliott boys. Mike is on 22, Eldorado gulch, and the Elliotts on 7. Bonanza—both in good territory. Everything is staked in all directions. Some of them are out in the hills fifty or sixty miles now with a pack. It is liable to be 50° below in a week. I think there will be plenty of them found dead in the spring. We do not intend to go out until spring after we wash our dump.

Sunday, we worked all day on the cabin, 16x18. The logs in it are from 10 to 14 inches in diameter and laid in moss. The roof will be poles laid tight, moss between them, about 8 inches of dirt. It will be 14 to 15 inches thick. Our windows will be made of bottles, as there is no window glass here. A doctor in Dawson offered $50 for a six-light sash. They told him he could have it for $100. On the claim, fine timber; I cut a tree yesterday 150 feet high, but up the gulch further some of them go as far as a mile and a half for house logs and wood to burn the ground with. It will cost us but little to get wood. The water is not very good; affects the kidneys. We will melt snow as soon as it gets deeper. Well, I suppose you would sooner hear something about the gold in this country. It is hard to tell much about it that you have not heard before now. Like any other diggings, it has its rich and poor ground. Eldorado gulch, a branch of Bonanza, has proven the richest. Every claim and every lay is being worked now. The coarsest gold comes from there and from Skookum Gulch, which is near it, but in bench claims on Skookum from 25 to 50 feet above the water.

On Bonanza the gold is finer and generally not so rich, but a few claims that were worked last year were as good, or nearly so, as the others. The dirt you hear of and see generally is from 10 to 20 cents a pan, but often as high as $1 or more. The big pans told generally are of bedrock. Bedrock is of a bluish slate here and lays from 3 to 25 feet deep, but averages about 15 feet. These gulches are all marshes. The muck is about 9 feet deep, more or less, and gravel (river-washed) the rest of the way to bedrock. Some of the gravel is pay for 6 feet above bedrock, but generally from 2 to 4 feet is thawed by standing the wood up against, so the fire will not strike higher than pay. The first thing in the morning is to take out the unburned wood and big rock, then dig out the gravel and send it up. This is done in a couple of hours; then fire it again, and clean-up for the night about 4 o'clock. When the drift gets large enough, one fire at night is enough. It is still too warm to use two fires, as it thaws the sides of the shaft and does not have time to freeze solid again. This makes too much dead work. The gulch claims cannot be worked in summer, for this reason and water, but by lagging the sides. Bench claims are worked all summer. This is the Twandike (Klondike) division of the Yukon mining district. You cannot record but one claim in it. Each stream flowing into the Yukon is a division. There was not a claim on the Klondike until three weeks ago. They could not find anything else to locate, so some chuchalkers (new comers) located it from the mouth of Bonanza to the Yukon, about two miles. There has been nothing found on the Klondike yet that is worth anything.

The Stewart and Indian rivers head within about forty miles of here. Each of them is a division. A great many are taking up claims there. I saw one fellow start for Indian river to-day. He is all right if the thermometer does not slide down to 40° or 50° below. I have heard some good reports from both rivers, especially Quartz creek, a branch of Indian river. There will be more than a hundred times as much work done here this winter as last, but the question is: Will they take out more gold? I think they will. A lay gives one-half to the claim owner. Then there is talk of the 20% royalty law being enforced; that leaves 40%; so you see it has to be pretty rich to pay wages, which are $15 per day—I mean $1.50 per hour. There are about six hours in the short days.

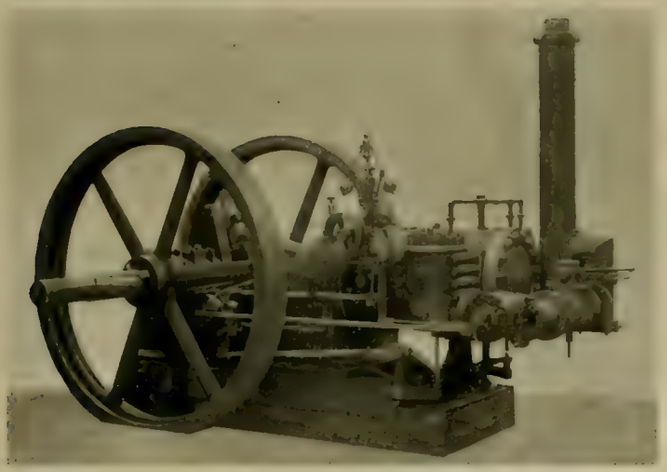
The grub question here is the main one. Flour is $75 to $100 per 50-lb sack; bacon, $1.50 to $2 per pound; beans and rice, $1.50 to $2 per pound; candles, $1 each; sugar is plenty at $30 per barrel of 100 pounds, tea at $1. Plenty tea and sugar are all that the stores (two stores) sell that you can eat. Everything else is in about the same proportion. The only chance to buy grub is to find some one going out. There has been a great many gone down the river to Circle City and Fort Yukon. Fort Yukon and Circle City is as far as the boats got this fall (stuck on a bar). There are 1000 tons of grub at Fort Yukon. There are hundreds waiting for the river to freeze over, so they can get back to Dyea and Skaguay. Some are after grub to speculate on, others will stay out. Many of the old-timers leave for Circle. They are tired of British laws. It is estimated that from 25 to 30 per cent are leaving here. Three men came down the river with us that stayed in Dawson two days, then went on to Fort Yukon. Many have not half enough to eat till summer. They will be going all winter. Some of them are claim owners.

MONTANA.

There was an increase in every branch of mining except in silver during '97, and even the silver output was larger last year than '96, because of the continued increase in the production of the copper mines at Butte, the ores of which also carry silver. There are now less than half a dozen exclusively silver mines operating in the State. The gold output for 1897 was about $1,450 000 as compared with $1,-380,671 for 1896. There was a notable increase during the year in gold receipts from river dredging, although the production of placer mines operated by hydraulics and sluicing was less than for 1896, owing to a shorter season. During 1896 the placers of the State yielded 13 per cent of the entire gold production. The most notable increase in production for 1897 was from Montana's copper producers. The State produced in 1896, 232,096,000 pounds of copper valued at $25,356,540. Mr Braden estimates the value of the copper output for 1897 at $27,000,000

COLORADO.

Among Colorado dividend-paying mines are the Anchoria-Leland, 1c per share, monthly, payable 15th, total paid $108,000, including that declared for January, '98; Argentum-Juniata, 3c per share, monthly, last dividend November, '95, total dividends paid $156,000; Bangkok-Cora Bell, 1c per share, irregular, total paid $107,500, last dividend Nov. 5, '95; Big Six, ¼c quarterly, total paid $15,-500; Elkton Con., 2c per share monthly, payable on 20th, total paid $126,960; El Paso Gold, 1c per share, paid Dec. 10, '97, total $17,285; Gold Coin, 1c, Dec. 29, $20 00; Golden Cycle, 1 cent per share per month, paid $130,000 in dividends since May 1, '97; Golden Eagle, Leadville, amount dividends paid to date $60,000; Golden Fleece, varying from 1 to 3c per share, monthly, payable on 15th, total paid $575,497.85, last dividend paid Feb. 15, '97; Gold and Globe Hill, $3 per 100 shares, monthly, total paid $51,625; Iowa (Silverton), 1c per share, monthly, last dividend Dec. 15, total $75,000; Isabella, quarterly, payable on 25th, total paid to date $270,000; Lillie G. M., commenced Oct. 20, '97, 1 cent per share, total dividend paid $37,110; Mahala, monthly, total paid $750,000, netted $30 000 for December; Marion Con., paid in royalties $244,702 in two years; Mt. Rosa, paid $50,000 in dividends from sale of property, with $30,000 in treasury, last dividend Dec. 28; Moose, 1c per share, last dividend paid Feb. 10, '96, total paid to date $186,000; Moon-Anchor, 2½c per share, monthly, payable on 1st, total paid $90.000; Mollie Gibson, last dividend January, '95, total paid $4,080,000; Nugget, total dividend paid $15,000 last dividend April, '96; Portland, from 1c to 3c per share, monthly, payable on 10th, total $1,297,080; Pharmacist, paid $81,000 in dividends, nothing for over three years; Princess, ¼c per share, irregular, total paid $45,000; Smuggler of Aspen, last dividend paid November, total paid $925,000; Smuggler-Union (Telluride), pays $1 per share, total paid $100,000; Strong, total dividends $300,000; Rebecca, $20,000, last dividend Feb. 26, '96; Tom Boy (Telluride), dividends paid $700,000; Union, 1c per share, monthly, total paid $82,744 and a 10 per cent stock dividend, last dividend paid June 25, '96; Union Leasing (Leadville), 4c per share, monthly, last dividend July, '93, total paid $340,000; Victor, 15c per share, quarterly, payable 10th, total paid $895,000, dividend declared 15c, with an extra of 5c, making $40,000 for December.



UTAH.

Following is a list of dividends paid by Utah listed mining stocks in 1897: Bullion Beck, $170,-000; Centennial-Eureka, $90,000; Chloride Point, $5 000; Daly, $37 500; Eureka Hill, $200,000; Galena, $5,000; Geyser-Marion, $63,000; Golden Star $5 000; Gemini, $250.000; Horn Silver, $2 ,000; Mercur, $311,000; Ontario, $20 ,500; Silver King, $480,000; Sacramento, $10,000; South Swansea, $82,500; Swansea, $55,000; Utah, $4,000. A total of $1,998,-000.

Hercules Gas Engine Works,

Office: 405-407 Sansome St., San Francisco.

Works: — 213, 215, 217, 219, 221, 223, 225, 227, 229, 231 Bay Street.

STANDARD HORIZONTAL HERCULES ENGINE.
Designed to use Gas, Gasoline, or Distillate Oil.
Built in sizes from 4 H. P. to 100 H. P.

The HERCULES Engines of all types are designed with special regard for simplicity, combined with proper arrangement of parts to obtain the very highest efficiency, economy and close regulation. The best of materials, even to the smallest detail; true mechanical design, the best of workmanship and finish; compactness and ease of access for the adjustment and cleaning of all parts. When applying for information be careful to state fully the duty to be performed, and, if possible, the horse power required.

GENTLEMEN:—I have very encouraging reports from my engineer as to the workings of the 25 H. P. Engine you sold us some time ago. He reports that it is perfect in its action, and with all, a very fine piece of machinery. The automatic controller (governor) is so sensitive that they can add or throw out any of the machinery and in all cases the engine responds *instantly*. We cannot say too much in its praise. Engine runs perfectly on 38 gravity distillate oil.

Very truly, W. H. MAXSON.

The HERCULES Stationary and Hoisting Engines are much cheaper to operate than any other make. Read the following:

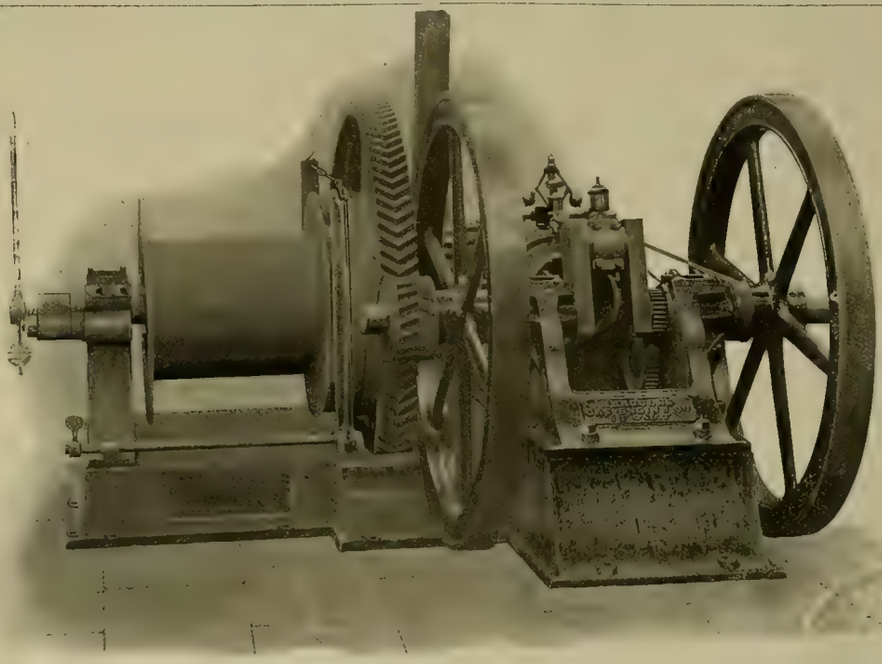
NEVADA CITY, CAL., Nov. 14th, 1896.

Hercules Gas Engine Works—
San Francisco, Cal.

GENTLEMEN:

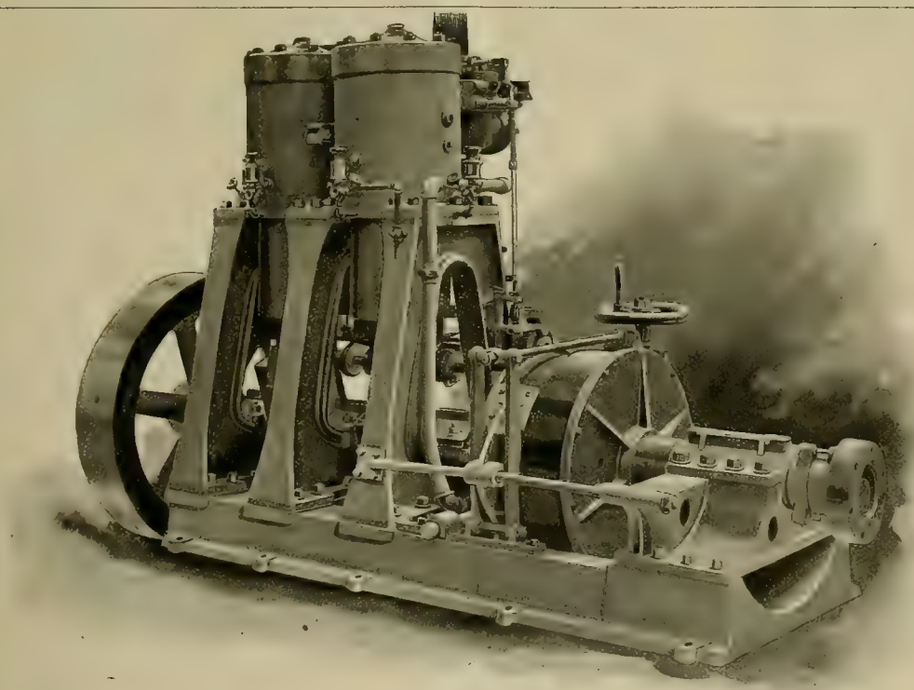
In reference to the gas engine hoist you put in the Delaware Mine, I will say that it is giving excellent satisfaction. We are hoisting 50 tons of gravel per day of 24 hours, 400 feet, consuming only three gallons of gasoline.

Very truly yours,
C. H. MALLEN,
Supt. Delaware Gold Mine.



SONORA, CAL., Aug. 24th, 1897.

Hercules Gas Engine Works—
San Francisco, Cal.



GENTLEMEN:

We purchased from you last year one of your gasoline engines and mining hoists, and, after using it continuously for a year, we are pleased to say that it gives entire satisfaction both as a hoisting engine and pumping plant. Our incline is 200 feet deep, and at this depth the engine performs all that is required of it easily. It has never given us a moment's trouble, and we would recommend any one wishing an economical and efficient hoisting plant to adopt the Hercules Combined Gasoline Engine and Hoist. Wishing you the success which you deserve, in all branches of your business, we remain

Very truly yours,
MUNROE & BIRNEY.

NEW STYLE HERCULES HOIST. Built in all sizes 4 H. P. to 100 H. P. Single or Double Drum Hoists up to 200 H. P. Use Gasoline or Distillate Oil. ENGINES GUARANTEED.

60 H. P. SELF-STARTING HERCULES MARINE ENGINE. Built in all sizes to 200 H. P.

Marine HERCULES Engines are furnished complete with Propeller, Shaft, Tank for Gasoline, and all Fixtures. Sizes 4 H. P. to 200 H. P.

EVERY ENGINE FULLY GUARANTEED.

SAN FRANCISCO, CAL., Dec. 22nd, 1896.

Hercules Gas Engine Works—
405 Sansome Street, San Francisco, Cal.

GENTLEMEN:

After several weeks' trial we wish to express our opinion of the Marine Engine which you placed in our Schooner "Admiral."

Our contract with you called for an engine capable of exerting 30 H. P.; to use distillate as satisfactorily as gasoline; to be self-starting and first-class in every particular.

Our summary of the transaction is that you filled the order promptly, the engine developed about 40 H. P., the self-starting device is a success and fulfills your agreement and your distillate generator is all that you claim for it.

As soon as the engine was installed the "Admiral" began her regular trips to our oyster beds, distant 22 miles, the boat making the run each way inside of two and one-half hours. The dimensions of our boat are 51 feet over all, 20 feet beam and 4½ feet draught.

The engine for the "Admiral" is the fifth we have ordered from you and we are pleased to be able to say that you have made great advances in your engines, especially with regard to your new distillate generator and improved sparking device, with all springs external, the latter point being the greatest improvement, in our opinion, that you have made.

We will be pleased to recommend your engines to any one desiring information on the subject.

Very truly yours,
THE MORGAN OYSTER CO.,
F. C. MORGAN, Secretary.

SEND FOR CATALOG.

Coast Industrial Notes.

—The Merchants and Manufacturers' Association of Los Angeles, Cal., this week opened an excellent exhibit of home products.

—The Chino, Cal., Beet Sugar Refining Co. has bought H. T. Oxnard's interest in the beet sugar factory at Hueneme, including the rights of way, sites, plans, machinery ordered, etc. Mr. Oxnard takes in exchange from the company a $750,000 mortgage on the property, payable next July.

—Work upon the San Joaquin, Cal., Electric Co.'s power-transmission line between Fresno and Hanford, via Fowler and Selma, began this week. Over 100 miles of wire will be used in the line, as three strands will be required to make the circuit. The Construction and Finance Co. of San Francisco have the contract to build the line. Electric power will be sent direct from the power house thirty-five miles east of Fresno, to Hanford, thirty-three miles south of Fresno. The power will be sent over the transmission line at a pressure of 19,600 volts, the electricity will not be utilized at such high voltage, but on its coming into the sub-stations at Hanford and Selma will pass through a step-down transformer.

—The Mexican Government has contracted with the Western Union Telegraph Co. the following rates of charges between the two countries: From any point in the Mexican Republic outside of the free zone to any point in the United States, Canada or British Columbia, $1.75, gold, per message of ten textual words, and 12 cents, gold, for each additional word. From any point in the United States of America, Canada or British Columbia to any point in Mexico where the Mexican Telegraph Co. have an office established, $1.85, gold, per message of ten textual words, and 16 cents, gold, per word for each additional word. To any point in the Republic where said company has no office, $2 15, gold, per message of ten textual words, and 19 cents, gold, for each additional word.

—The Japanese cruiser, Chitose, was launched from the San Francisco works of the Union Iron Works last Saturday. The Union Iron Works received information in the spring of 1895 that the Japanese government was inclined to place an order with the United States for some ships to increase her navy. On August 13, 1895, Mr. Irving M. Scott sailed for Japan to present the claims of San Francisco as a shipbuilding point, and there met Count Ito, Prime Minister of Japan, and Count Saigo, Minister of Marine of the imperial Japanese government, and presented the facts regarding the facilities, etc., existing in San Francisco. February 28, 1896, Mr. George W. Dickie sailed for Japan, as the technical expert of the Union Iron Works, to present to Captain Sassoo, Chief of the Naval Constructors, proof of our ability to design and complete any ship the Japanese wanted. June 25, 1896, Commander N. Miyaoko, Lieutenant S. Takakura and Captain S. Sakurai were appointed a Commission by the imperial Japanese government to examine and report upon the facilities and capacity of the Union Iron Works with regard to its ability to build the battleship. Mr. H T. Scott completed negotiations and signed the contract at Washington, D. C., on December 31, 1896, Minister Toru Hoshi signing for the imperial Japanese government. Captain S. Sakurai was appointed by the imperial Japanese government as inspector of hulls and Y. Wadazakai as inspector of machinery. The first piece of keel was laid on May 3, 1897. The first rivet was driven on June 26, 1897, in the presence of the various Consuls residing in San Francisco, and other distinguished guests. The Chitose is a second-class unarmored protected cruiser to be a part of the imperial Japanese navy. Her dimensions are: Length over all, 405 feet 2 inches; length, load water line, 396 feet; length between perpendiculars, 376 feet 5 inches; breadth, moulded, 49 feet; draught, normal, 17 feet 7½ inches; displacement, 4760 tons; speed, 22½ knots; I. H. P., 15,500; engines, two set, 40—60—66—66—36; revolutions, 150; No. of main boilers, 12. Armament: Two 8-inch quick-firing guns; ten 4.7-inch quick-firing guns; twelve 12-pounder quick-firing guns; six 2½-pounder quick-firing guns; five 14-inch torpedo tubes.

Commercial Paragraphs.

THE Union Gas Engine Co. recently furnished their 10 H. P. "Union" hoists to the Mars gold mine, Forest Hill, the Pine Ridge mine near Jamestown, the Yellow Aster mine, Randsburg. The company has furnished hoists and gasoline engines to thirty-six mining companies in California, Nevada, Arizona, Colorado and Idaho.

THE Gutta Percha and Rubber Mfg. Co., 30 and 32 Fremont street, this city, is manufacturing a drill hose for air or steam, for which much superiority is claimed. The best quality of rubber hose is wound with well-annealed flat wire to withstand great pressure, and the wire will not spring or lose its grasp of hose if cut, an advantage that will appeal to those who have had experience with wrapped hose. It is made in sizes from ½ inch to 3 inches, inside diameter.

THE Randsburg-Santa Fe Reduction Company, of Barstow, California, have placed an order with the Colorado Iron Works Company, of Denver, Colorado, for a 50-stamp mill concentrating plant, including also a complete ore-sampling plant. This mill will be a modern one throughout, and will be completed and ready for operation about the first of May. The Colorado Iron Works Company recently shipped a 10-stamp mill to the Gold Coin Consolidated M. & M. Company, at Springer, New Mexico.

THE Abner Doble Company, San Francisco, is securing a good share of the business occasioned by the general activity in mining circles. It has lately completed several large water-wheel contracts, and is working overtime on rock drills and air compressors. The company is also busy in the supply department, and anticipates a still greater demand when the Klondike business is in full sway. The warehouses are well stocked, particularly in the line of drill steel, iron, picks, etc. This is one of the concerns which cater alike to the prospector and the large mine owner. The mining trade is its specialty.

THE Hercules Gas Engine Works extend a cordial invitation to all visiting mine owners and superintendents to visit their works at 215 Bay street, and inspect the engines under course of building. The company will also be pleased to see any interested parties who may call at their office, 405 Sansome street, near Sacramento. Among several orders just completed by the Hercules Gas Engine Works is a triple cylinder, 45 H. P. Gasoline Engine, which will be used as motive power for the rope tramway at present being erected on Chilkat Pass. The engine is so designed that either two or three cylinders can be used, depending on the work to be done, and has also several other new features tending to economize in the cost of operation and facilitate the highest efficiency being obtained from the least amount of fuel. The company are also building a number of large marine and stationary engines for the Yukon river, and are preparing to build a number of stern wheel boat engines.

THE Pelton Water Wheel Company reports a large run of business for the last two months of 1897. Among the more important shipments may be mentioned: Wheels, governors and connections covering a 2000 H P. plant for San Rafael Paper Mills, Mexico; six wheels for various other localities in Mexico; a 1200 H. P. wheel, with governors and accessories for an electric transmission plant for Petropolis, Brazil—this being a duplicate of their former plant; an electric power transmission plant for Frujillo, Brazil; seven wheels, with governors, pipe lines and accessories, to operate tea and coffee plantations in Java; three wheels for the Ruby mines, in India; two 500 H. P. wheels for operating mills in Tasmania, Australia; three 1000 H. P. wheels, with governors and accessories, for the Yuba Power Co., Marysville, Cal.; one 200 H P. wheel for operating the mill of the Dexter Gold Mining Co., Tuscarora, Nevada: nine wheels for various mining operations in California. A large number of orders are in hand, making the outlook for the present year very encouraging.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JANUARY 8, 1898.

597,456.—BICYCLE BRAKE—L. Bowles, S. F.
597,632.—PROPELLER—A. H. Carpenter, Stockton, Cal.
597,633.—PRUNE DIPPER—F. C. Chapman, Los Angeles, Cal.
597,552.—WAVE POWER—J. M. Dyer, S. F.
597,553.—WAVE POWER—J. M. Dyer, S. F.
597,466.—AIR MOTOR—Hansard & Hiatt, Lebanon, Or.
597,611.—WRENCH—Haye & Humphrey, Pendleton, Or.
497,648.—HOSE NOZZLE—E. D. Kellerman, Montesano, Wash.
597,617.—CONCENTRATOR—C. J. Paine, National Military Home, Cal.
597,565.—GUNCOTTON—C. Quinan, Pinole, Cal.

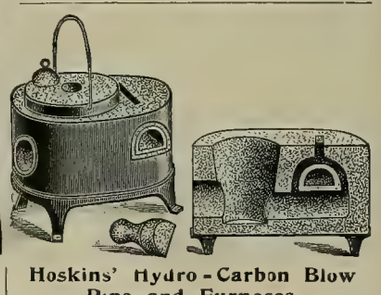
NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Personal.

R. L. DUNN returned this week from Siberia, where he has been examining some hydraulic mining property.

W. H. STORMS has interested capital in the Good Friday mine on Yost ranch, near Soulsbyville, Tuolumne Co., Cal. In future it will be known as the Agnes, and will be thoroughly developed.

E. M. WADE, of the firm of Wade & Wade, Los Angeles, Cal., is witnessing the Jubilee and the mining exhibits. He has bought a complete milling outfit for milling ores, to be set up in Los Angeles, which will be the only mining machinery in full operation in the city. It consists of a stamp mill, a concentrator and cyanide works, and with it he expects to operate the cyanide process either by zinc precipitation or by electrolytic process.



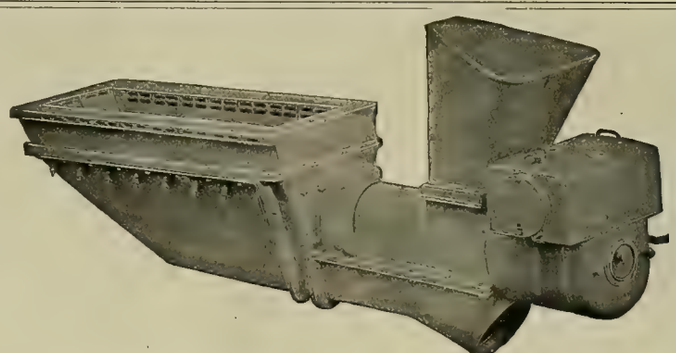
Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAVE POWER.—James M. Dyer, San Francisco, Cal. No. 597,553. Dated Jan 18, 1898. This invention relates to a means for applying the motion and power of the waves and transmitting it into a continuous rotary motion. In the present apparatus a float is made adapted to rise and fall with the movement of the waves, and this float is secured by a single anchor extending outwardly from the shore. A single rope extends from the float diagonally to a stationary mechanism on the shore so that the forward and backward and also the rising and falling movement of the float are conjointly utilized for the transmission of the power to the rotary apparatus.

PROCESS OF MAKING GUN COTTON.—Clarence Quinan, Pinole, Cal. No. 597,565. Dated Jan. 18, 1898. This invention relates to improvements in the manufacture of gun cotton from hydro-cellulose. The object of the invention is the preparation of an improved and purified hydro-cellulose with a view to a corresponding improvement in the quality of the resulting gun cotton. The process serves to remove the mineral matter, which amounts to from 1 to 2 per cent in the ordinary cellulose fiber, which is available for the manufacture of gun cotton and to nitrate all of the cellulose, where in other processes from 1 to 5 per cent remains unnitrated. In this process the mineral matter is removed so that the hydro-cellulose is nearly or quite free of ash and the waste product of factories where the high explosives is utilized in the process, which greatly cheapens it.

WAVE POWER.—James M. Dyer, San Francisco, Cal. No. 597,552. Dated Jan. 18, 1898. This invention relates to a mechanism for utilizing the power produced by the rising and falling of a vessel or float upon the waves. It consists essentially of a vessel or float having a suitable mechanism mounted upon it, means for anchoring the vessel or float to a fixed point which serves as a fulcrum about which it rises and falls, a second rope or cable so connected with the anchoring cable or fixed point that the alternate slacking and extension of the anchoring cable will transmit motion through said rope to mechanism mounted upon the vessel through which the alternate reciprocating movements are transformed into a continuous rotary movement.



Hoskins' Hydro-Carbon Blow Pipe and Furnaces.

It has been more than fourteen years since Mr. Hoskins first introduced his Hydro-Carbon Blow Pipes and Furnaces to the assaying public, and though it was at first up-hill work to convince those interested that the use of gasoline was not attended with danger, and that his apparatus was practical, it will be admitted by all now that his appliances have not only revolutionized the practice of assaying in regard to the furnaces used, but the mining public has been materially benefited.

It is also a fact that during all this time he has had no successful imitators. This is no doubt due to the determination on his part that his Furnaces and Blow Pipes shall always be the best for the purpose, and he has always been ready to meet any reasonable demand on the part of the user.

His firm is still occupying this position, and by addressing Messrs. Wm. Hoskins & Co., 81 So. Clark St., Chicago, with a request for their new catalogue, full description and prices will be found of new designs and types of Furnaces, including Combination and Portable Furnaces, such, for instance, as that above illustrated. It might be well in this connection to add that Mr. Hoskins has just been allowed protection on his new Combination Furnaces by letters patent, No. 596,707—issued January 4, 1898. *

The American Stoker.

The American Stoker, illustrated herewith, is claimed to be a practical exemplification of the new theory of underfeeding coal to a boiler in such a way as to produce perfect combustion and thus economize in the use of fuel as well as obviate smoke. By the process of feeding the coal from below and the introduction of a sufficient amount of air, the volatile gases are released below the fire, the coal is burned as a coke and the released gases consumed as they pass upward through the bed of glowing coke. The non-combustible material is left in the form of a vitrified clinker.

Immediately beneath the coal hopper, and communicating with it, is the conveyor, this in turn communicating with the magazine in direct line with it. A screw conveyor or worm is located in the conveyor chamber, and extends the entire length of the magazine. Immediately beneath the conveyor chamber is located the wind box, having an opening beneath the hopper. At this point is connected the piping for air blast. The other end of the wind box opens into the air space between the magazine and outer casing or envelope. The upper edge of this magazine is surrounded by tuyeres or air blocks, these being provided with openings for the discharge of the air blast. Beneath, and in front of the hopper, is located the motor for operating the stoker. The only moving parts of this motor are the reciprocating piston and rod. The piston rod carries a crosshead, which, by means of suitable connecting links, operates a pawl mechanism, which, in turn, actuates the ratchet wheel mounted on the conveyor shaft. The space on each side of the stoker, between the tuyere blocks and the side walls of the furnace, is occupied by dead plates or air-tight grates. The coal is fed into the hopper carried by the conveyor into the magazine, and is there forced upward, "overflowing" on both sides, and spreading upon the dead grates the entire width of the furnace. The entire mass of coal above the tuyeres and all of that upon the dead grates is ignited, carrying a bed of burning coke from 14 to 18 inches in depth.

The manufacturers, who recently moved their plant from Dayton, Ohio, to Brooklyn, New York, have established a Western agency at 1116 Seventeenth St., Denver, Colo., with Mr. F. Wallaker in charge. This Stoker is in successful use in one of the large hotels and two of the smelters of Colorado.

THE GREAT MINING FAIR

AND

Klondike Exposition

WILL OPEN

Saturday Evening, January 29th, 1898,

AND CONTINUE FOR FIVE WEEKS,

AT THE

Mechanics' Pavilion, San Francisco.

The Fair will contain practical exhibits and demonstrations of quartz, placer and all other methods of mining, and mining machinery. Complete working plans of the North Bloomfield mine will be in operation on a large scale.

In connection with the Fair there will be a complete Klondike outfitting exhibition, together with Klondike cooking lectures and practical demonstrations of packing supplies over the trails by horses, burros and men; also the methods of transporting these supplies across the lakes and down the Yukon river to Dawson.

Transportation Over the Chilkoot Pass.

Within the next few months will set in, from all parts of the globe, a heavy tide of travel to the Klondike. The all-water route via St. Michaels and the Yukon presents the least discomfort to the traveler, with the great drawback, however, that the destination can hardly be reached before July 1st. The most direct and otherwise feasible route is by way of Dyea and the Chilkoot, and the bulk of the travel will probably tend that way. In the issue of October 23, '97, was mentioned the fact that the Chilkoot Railroad & Transport Co. of Tacoma had entered into a contract with the Trenton Iron Co., through their San Francisco agent, Mr. Newton M. Bell, for a Bleichert wire-rope tramway to be erected through a portion of the Dyea canyon and over the Chilkoot pass to Crater lake, the most southerly of the chain of lakes connecting with the Yukon. The inception of this enterprise dates from the early part of last September, when a party of surveyors under the direction of A. McL. Hawks of Tacoma, Wash., made a complete topographical survey of the ground and determined the most feasible route for the proposed tramway. The company selected the improved Bleichert system built by the Trenton Iron Co. That company has erected and put in successful operation some long and difficult lines, among which are the twelve-mile tramway on the island of Hayti, the Macate line in Peru with its extraordinary fall of 4920 feet in a total horizontal length of 10,450 feet, and lines in Colorado, where practically the same difficulties were presented as at the Chilkoot.

The Chilkoot line was planned to be built in two sections, the first, extending from Canyon Camp to Sheep's Camp, a distance of four miles, the second, from Sheep's Camp to Crater lake, a distance of three and one-half miles. The first section is now so far advanced on the ground that its early opening for business is practically assured. In connection with the tramway, is a surface road, running from tide-water along the Dyea river and through the Dyea canyon, so that, with the completion of the two sections of the tramway, the entire distance from Dyea to Crater lake will be covered by an uninterrupted line of transportation. It is probable that by another season the tramway system will be extended to Lake Lindemann, the head of lake navigation.

The tramway is of the Standard Bleichert type, but with modifications to secure minimum lightness with the same factor of safety; smaller cables and ropes are employed, but made of "plough" steel of higher tensile strength than steel ordinarily used in cables, and many of the castings, usually of iron, are made in lighter patterns, of cast steel.

In this way the total weight was materially reduced, and with it the cost of transportation and erection. Herewith (Fig. 1) is an illustration of a typical Bleichert tramway, showing the line at the Royal Coke and Coal Co.'s mine, in West Virginia, which gives a general idea of the Bleichert system.

FIG. 1.—BLEICHERT TRAMWAY OF THE ROYAL COAL MINE, WEST VIRGINIA, SHOWING SPAN OVER NEW RIVER—DAILY CAPACITY 800 TONS.

In this system of aerial transportation, the loads are suspended from carriages which run on stationary cables, and are moved by a light endless traction rope to which they are attached, and which travels continuously about terminal sheaves. This is the general distinguishing feature of the system and has led to its being known in many localities as the "double-rope" system. The usual style of supports are wooden framework structures, but at the Chilkoot single iron poles firmly cemented into rock are used. These poles carry cross-arms, on either side of which are saddles which support a double line of track cables, over which run the grooved wheels of the carriages. Lower down on the supports are other cross-arms with carrying rollers upon which the moving traction rope runs. In the Chilkoot Pass section of the line eighty of these supports are used, their height ranging from 13 to 25 feet, placed at varying distances according to the contour of the ground, the longest single span being 1600 feet. As the loads will generally travel from a lower to a higher elevation, power is required to operate the line, which will be provided at Sheep's Camp by a high-speed engine and sectional boiler of about 45 H. P. One angle or turn station occurs in the line, and two tension stations where the main cables are parted and the proper tension is maintained by means of weight boxes. The ordinary tramway car, such as used for transportation of ore, is shown in the accompanying illustration (Fig. 3).

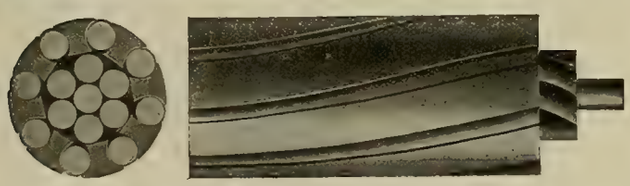

FIG. 2.—LOCKED-COIL TRACK CABLE.

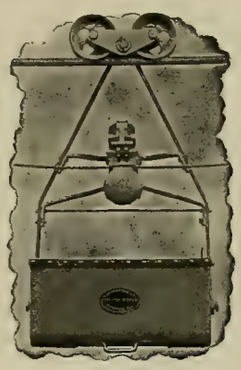

FIG. 3.—TRAMWAY CAR.

The complete car, it will be observed, consists of a carriage which runs on the track cable, a hanger depending from which supports the bucket and a grip, by means of which the car is attached to the traction rope. When the car arrives at either terminal, or other station, the grip detaches automatically and the carriages are switched off from the cable and onto shunt rails. By means of shunt rails the carriages are led around to the opposite cable, thus making the system continuous.

The illustration (Fig. 2) shows the details of the locked-coil cable used for carrying the suspended loads, in which it will be noted that the outer wires are of such shape that they interlock and present a smooth surface, corresponding to that of a solid cylindrical rod.

Early Mining and Milling Methods in California.

Written for the MINING AND SCIENTIFIC PRESS.

In the year 1850–'51 two brothers (Frenchmen), bearing the somewhat English surname of Winter, located two mining claims on the outcroppings of a white quartz ledge one-half mile north of the lively town of Angels Camp, Calaveras county, on the road leading to Altaville. As memory serves, these claims were each 450 feet in length, as prescribed by the then existing mining laws of that district. This bold outcrop of the ledge standing prominently above the road, about midway between these two mining camps, was called in those early days "the white quartz blowout," and forms to-day a part of what is known to all the mining world as the "great mother lode of California." It is an interesting fact that these locations were made about 2000 feet northerly from the northern boundary line of the now famous "Utica mine of Calaveras."

In 1852 the Winter brothers began opening their claim by driving an open cut across and along this outcrop or blowout, following the primeval method of mining then in vogue in nearly all the mining districts of California. To reduce the quartz from their mine to bullion they built two arrastras after the aboriginal pattern, the propelling power being two mustangs, a man and presumably a whip. That the ores thus extracted must have contained "pay," that this crude milling outfit must have been successful in its working, that the clean-ups must have been fair, is demonstrated by the fact that in 1854–'55 they erected a 12-stamp mill driven by an overshot wheel 30 feet in diameter, taking its necessary water through a flume leading from a ditch, then owned by the Union Ditch Company, which in its turn took its water from the Stanislaus river far above the Big Tree grove of Calaveras. This undertaking, in those days of high prices for everything, must have been expensive, but the cost was paid from out of the earnings of the two arrastras, and it was surmised that a handsome balance remained to the credit of the two brothers in the Bank of France.

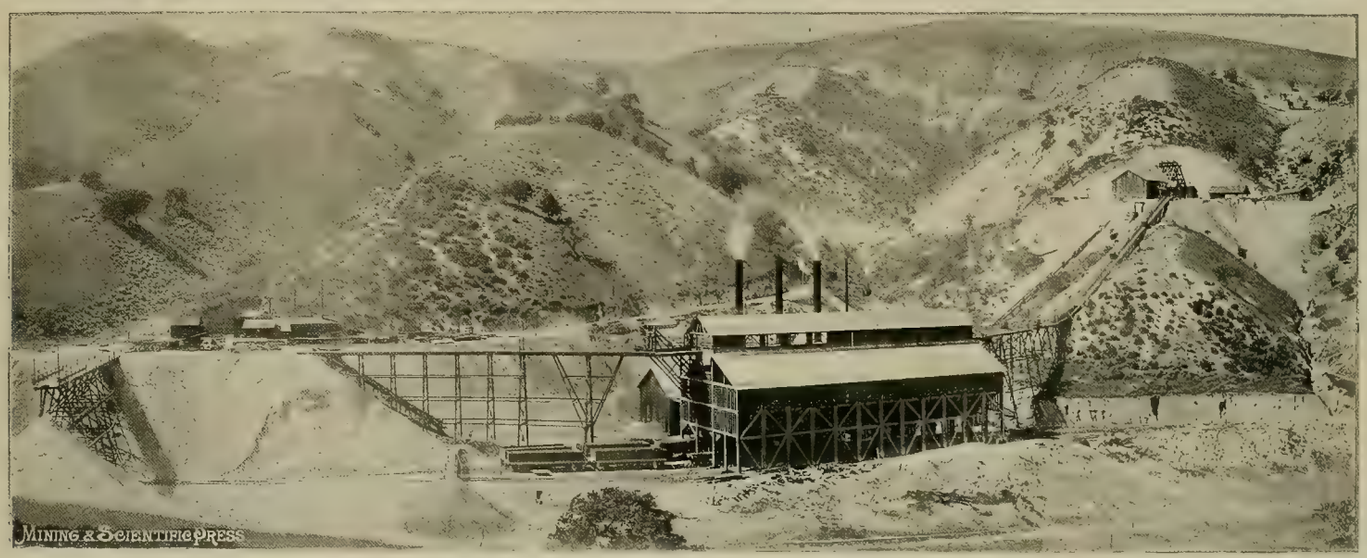
It is to the peculiarly primitive construction of this stamp mill that the writer desires to call attention—"to point a moral and adorn a tale,"—to compare the style of the quartz mills of the '50s with the "up-to-date" mills of the present. The description is from memory of more than forty years.

The driving power was derived, as previously stated, from an overshot water wheel, 30 feet in diameter, geared to the battery cam shaft driving the twelve stamps, which were distributed in two batteries of six stamps each, there being two iron mortars arranged for dry-crushing the ores.

The cam shaft was formed from a round wooden log of sufficient length to extend from its gearing to the wheel, across the full length of the two batteries, substantially supported in rough, cast-iron arm boxes, and fitted with short, one-arm, iron cams, set in the shaft at regular intervals. The stamps were framed of hard wood, 8 inches square, fitted with projecting collars, answering the purpose of our present tappets, and by which they were lifted in the successive revolutions of the cam shaft and cams. The lower ends of these stamps, or, more properly, stems, were fitted with square plates or shoes of cast-iron, 4 to 6 inches thick, and corresponding square dies were fitted closely in the bottoms of the mortars, and, being intended for dry crushing, the bottoms were placed flush with the battery floor.

The open cut from which the ores were mined was about 300 yards distant from the mill, and the ores were transported in cars over a rude tramway of wooden rails leading thereto, and were dumped on the floor back of the mortars, where they were broken into suitable fragments and fed by hand into the mortars under the stamps, automatic ore feeders not then having been dreamed of nor conceived.

The fronts of the mortars were made open, in order that the crushed ores might be discharged on to the battery floor, and from the accumulating piles the ores were shoveled on to inclined screens of suitable mesh, after the fashion of the ordinary coal screens, the coarser fragments being re-shoveled under the stamps for further pulverization—certainly a tedious process as compared with the present automatic methods of handling ores.



To the main, or battery, portion of this mill building were two annexes, one on each side. In the larger annex six arrastras were originally placed, and three in the smaller; subsequently six others were added, making a complement of fifteen, all being driven by a rough and complicated system of gears and pinions from the ponderous, clumsy, overshot water wheel. The screened ores were wheeled in barrows from the battery room and dumped in piles conveniently near each of the arrastras, whence they were again shoveled into the arrastras, as the huge stone drags keep up their ceaseless, unremitting round of grind, grind, grind, until complete pulverization and amalgamation of the ores were effected.

During the writer's superintendence of this queer milling plant, samples of the dry screened ores were taken from the several piles generally twice, sometimes four times each day, and panned or horned; if the horns showed plenty of colors, the runs were continued usually six weeks; if the colors were few and far between, the runs were longer. The work of cleaning up these fifteen arrastras was a job to be dreaded. They were literally to be torn to pieces and rebuilt. There was amalgam everywhere; all of the participants were besmeared with it—dirty and disagreeable.

Let us for a moment institute a comparison between the methods of then and now—note the difference between this huge 30 foot overshot wheel and the present compact hurdy gurdy of the Pelton form; look at the wooden cam-shaft and the square wooden stamps, crushing but little more than half a ton per day, and compare this with the trim stamp mills of to-day, with their stamps, weighing from 700 to 1200 pounds each, dropping from 75 to 110 times per minute and crushing from two to three tons per day.

Look at the labor of breaking the ores by hand and then on the ore crushers now in use; consider the feeding by hand and the automatic work of the ore feeders of the "Challenge" type; note the slow process of wheeling the crushed ores to the arrastras and the tedious drag, drag of the arrastras as compared with the present system of amalgamation in our "up-to date" stamp mills, and subsequent concentration of the valuable metallic particles by the intervention of concentrators of the "Triumph" or "Frue" style—and all of these improvements have come to pass through the inventive genius of Californians; and in this year of our Golden Jubilee may we not thank God with grateful hearts that when this "land of gold" came as a suitor for State sovereignty that she was marshalled with a glad welcome into the Union of these United States of America.

R. B. NOYES.

CORRAL HOLLOW, CAL., COAL MINES.

Coal Mines at Corral Hollow, Cal.

Production of a good quality of coal in California, especially in the vicinity of San Francisco, would be of benefit to manufacturing interests here. The money expended annually for coal which is shipped here from all parts of the world would remain here and help to develop the great resources of this State.

The coal mines at Corral Hollow, Cal., have been developed to such an extent in the past few years that a description of them will be of interest. The mines are in Alameda county, twelve miles from Livermore, fifty miles from San Francisco. They cover from six to eight square miles, and over the entire territory extensive prospecting has been carried on for several years, with the result that good quality of coal has been discovered in commercial quantities. The San Francisco & San Joaquin Coal Co. have fitted up a plant at Corral Hollow, most of which was designed in the office of Messrs. Cobb & Hesselmeyer, consulting mechanical and hydraulic engineers, of San Francisco. A comprehensive view of the entire plant is shown by the accompanying illustration, engraved from a photograph taken by Mr. Hesselmeyer.

The hoisting works, which consist of a pair of direct acting Corliss hoisting engines of approved construction, are located on the hill on the extreme right of the picture, and the gallows frame close by stands directly over the inclined shaft. The shaft is 11x22 feet, divided into three compartments, two of which are used for hoisting coal and the other for pumping. The cage by which the cars are hoisted is of novel design, and discharges the cars (three in number) automatically as they reach the surface. From here the cars are run on a rope tramway down to the top of the main bunkers, where they discharge automatically in any desired section of the bunkers, after which the empty cars are returned to the top of the hill. The main bunkers, which are 105 feet below the hoisting works, are 72 feet wide by 145 feet long, and 50 feet high from the ground to the level of the tracks. They have a capacity of 2000 tons of lump coal. The coal, upon being discharged from the cars, falls upon screens, which separate the lump from the fine material, which then fall by gravity to their respective places. They are arranged over four railroad tracks and cars can easily be loaded with lump coal, screenings or intermediate sizes, as desired.

The railroad which runs from the mines to Stockton is about forty miles long, and is considered by engineers to be one of the best constructed roads in California. All the coal is shipped over it from the mines to Stockton in patent bottom-dumping gondola coal cars, each of about thirty tons capacity. On arriving at Stockton the entire train is run on top of the bunkers located at tidewater, which have a capacity of 2000 tons. They are 42 feet wide, 200 feet long and 38 feet to top of rails, and are fitted with automatic discharging devices for cars on one side and steamers on the other.

The boiler plant at the mine, which supplies steam for the hoisting engines, electric light plant, air compressors, etc., is located directly back of the main bunkers and consists of six horizontal tubular boilers of about 500 H. P., contained in a well-constructed building 48x130 feet. The main steam pipe is carried by the most direct course to the engines, and the exhaust steam is returned by a 14-inch pipe to the condensers, which are located down near the boiler house. These condensers consist of a series of manifolds laid horizontally, over which the cooling water flows, and the water is used over and over again. It is cooled on a number of large cooling trays, which consist of two sets of corrugated iron trays, three in each set, and are each about 16 feet wide and 85 feet long, placed one above the other and at such an angle that the water runs from one to the other, and is thereby sufficiently cooled. A centrifugal pump returns the hot water to the top of the cooling trays for a repetition of its work.

The main tunnel is 10x10 feet, and is located on the extreme left of the illustration. It has been run in for a distance of about 3000 feet. Several large and distinct veins of coal have been cut through. Some of these are being worked, and the coal is delivered to the bunkers previously described. It is believed when the mines are working up to capacity that about 1500 tons of coal can be shipped daily.

The Beam Gold and Silver Process.

Successfully and economically treats Tellurium, Sulphide and Pyritic Ores, saving the values up to 90 and 95 per cent. . . .

The ores, mixed with fluxes, are roasted in air-tight muffles, whereby sulphides are converted to sulphates and reduced to proper form for amalgamation. The gold is set free.

By the BEAM Method it is possible to treat refractory ores profitably whose values are as low as $4 per ton. Experiments made at our Denver mill prove every statement we make. They demonstrate that the cost of treatment does not exceed $2 per ton with furnaces having a capacity of twenty-five tons per day. Our experiments prove that the BEAM Roasting and Converting Process is adapted to the treatment of all refractory ores with the exception of lead carbonates.

AN EXPERT REPORT.—The following from Chas. Gibson, D. Sc., a metallurgist of unquestioned character and ability, is the result of his investigations for outside parties:

DENVER, COLO., Sept. 18, 1897.

Mr. Geo. B. Dodge, Denver, Colorado.—DEAR SIR: Pursuant to request, I beg respectfully to submit my observations, as viewed from a scientific and technical standpoint, on the "Beam Gold and Silver Process."

Up to the time of my arrival in Denver I had not even heard of the "Beam Process," and my surprise may be imagined when I heard claims made for this process which were inconsistent with all rules of metallurgy. I heard charges frequently and freely made that in some way, either by manipulation of the fluxes used, or by "ways dark and devious," the wonderful recoveries made by the process were brought about.

Being interested in refractory ores, I, therefore, determined to investigate. I was given free access to all parts of the works, and found that there were no secret or locked rooms where such manipulations might be made. Without letting my object be known, I was there daily, all the time, and finally found that too much had not been claimed for this process, but that the principles involved in treating ores by this process were so simple as to cause my utter amazement. Prof. Beam, it is true, has not invented a new science. He has simply made an observation and turned it to practical account for the purpose of extracting the metal values from the ores at a nominal cost.

The observation made by Prof. Beam is simply this: that where high heat is used in roasting, the sulphur is burnt or consumed as fast as it is liberated by the heat, and generates intense heat by reason of this combustion, which causes the particles of iron, etc., enclosing the metal values, as well as any free metals, to sink into a smaller and more compact form. As a result of this condition, the iron particles, etc., are brought closer together and converted to a hard, compact oxide, or, as before stated, into a smaller and more compact mass than when raw ore was first placed in the muffle. He then found that if he kept his heat very much lower, that instead of the particles of iron oxide getting closer together and denser, they became, as the sulphur was driven off, less compact, larger, and very friable, and were easily reduced to an impalpable powder by simply rubbing between the finger and thumb.

After fifteen years of unremitting patience and perseverance, and by painstaking work, Prof. Beam has succeeded in turning this simple observation to practical account for the treatment of refractory ores, whereby he is able to recover their metal values at a small cost. After patient investigation, Prof. Beam found that to attain this result, he must very seriously reduce the access of air to the mass of ore, especially at the beginning of the operation, for, if the air had free access to the ore at this stage, it combines with the sulphur as fast as it is set free by the heat, thereby generating an intense heat, which brings about the very conditions which he wishes to avoid; that is, the vitrifying of the comcounds and enclosing the values in a sort of cement. Hence, the use of a muffle furnace with air-tight doors, which places the ingress of air at all stages under the control of the operator.

I will now describe a little more in detail the furnace and the chemical changes which take place during the entire operation of this roast, or conversion, as it ought properly to be called.

The ore to be treated is ground dry by any suitable mill to about 40-mesh and placed on top of the furnace to expel the moisture. It is then run through an opening for the purpose, which communicates between the floors on the top and the muffles, and which is closed immediately after the ore has been introduced into the muffle. The doors on the side are fitted with ground joints, and are screwed tight as soon as the charge is introduced, so that the air, to all intents and purposes, is completely excluded. The furnace has been previously heated to such a temperature as it is found will decompose or split up the iron pyrites (FeS_2) (for we will confine ourselves for the present to this substance) into ferrous sulphide and free sulphur ($2\ FeS_2 = 2\ FeS + S_2$), as well as to volatilize the free sulphur as fast as it is formed, and expel it in a gaseous form through openings left in the arch of the muffle for that purpose, into the chimney flue, where it meets with the excess of air which has passed over the fire used for heating the muffles, and is there burnt, and by this heat thus generated, assists in heating the muffles, and thereby economizes fuel, and, of course, the creation of a high heat inside the muffle is effectually avoided. At this stage a current of hot air is forced through pipes into the muffles, over the ore, which if stirred from time to time, and the remainder of the sulphur is either burnt slowly off and ferric oxide (Fe_2O_3) is formed, and the oxygen combines with the ferrous sulphide, making it into ferrous sulphate ($FeSO_4$) and persulphate of iron ($Fe_2\ 3\ SO_4$) approximately according to the following equation:

$$9\ FeS + 19\ O = 1\ Fe_2\ O_3 + 2\ FeSO_4 + Fe\ 3\ SO_4 + 3\ SO_2.$$

The ore is now ready to draw and the iron oxide will be found to be very friable and easily reduced to a powder, while the sulphates can be leached out, and the values are found to be free and capable of being recovered by amalgamation. If copper and zinc be present, they are for the most part converted into sulphurets and can be leached out and recovered as by-products, if necessary. Silver is partly converted into sulphates and partly remains as sulphides, in either of which conditions it is recoverable. Arsenic, antimony and other metals are converted into harmless metals, or are volatilized.

It will readily be seen that the ore has been increased in weight, for while in eight molecules of pyrites, which contains sixteen atoms of sulphur, eight are lost, while thirty-eight of oxygen have been taken up. Multiplying eight by thirty-two (the atomic weight of sulphur), we have two hundred and fifty-six, representing the weight of sulphur lost; again, multiplying thirty-eight by sixteen (the atomic weight of oxygen), we have six hundred and eight, representing the weight of oxygen gained.

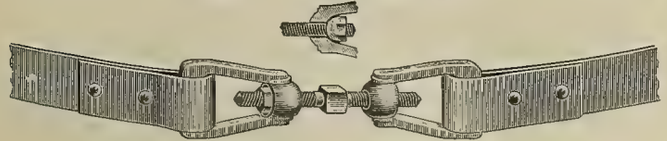
The claim, therefore, that the ore increases in weight by the roast, is sustained, if the chemical reactions as stated above actually occur, and it is a fact, as I have proved, that ferrous sulphate and persulphate of iron are actually present in the roasted ore before leaching, in about the proportions given in the above equation. There are a great many men who, hearing of something being done which is not in accordance with the rules of practice which they are accustomed to follow, without taking the slightest trouble to investigate and find out the truth, take upon themselves to criticise, condemn and stamp as a charlatan an humbug the party who has accomplished the deed. A great deal of abuse has been heaped upon Prof. Beam in consequence of his having claimed that he can and does regularly recover over 100 per cent of the fire assay of the raw ore. These ignorant detractors of Prof. Beam measure by false standards. One of these standards is the present method of fire assay. Now, as everybody knows, the present method of making a fire assay is notoriously incorrect, and gives incorrect results, especially for sulphide and tellurium, or other refractory elements. It would seem, then, that the results obtained by a fire assay are hardly suitable to use in order to condemn a process which claims to be able to get more than the fire assay, because it is evident that the process may be right and the fire assay wrong.

Then, is the roaster of the smelter a proper standard? Why, every metallurgist knows that immense amounts of value are daily lost by volatilization by these roasters. The roaster of a smelter can never be a standard of measure, or rather a limit to the recovery made by a competitive process. Prof. Beam does not claim to increase the gold in an ore—he does not claim the ability to ripen "green gold," but he *does* claim that all the gold originally in the ore is made free and recoverable, and this is being done by him daily.

No improvement, it must be borne in mind, has been made in the method of the fire assay for over a century, but the "Beam Process" already points in directions and to means whereby the value of some ore at least (if not all) may be more approximately ascertained.

It will be readily understood, where a reduced temperature is used, the cost of roasting will be very much reduced, especially as a roasting by the "Beam Process" requires but a fraction of the time required by the reverberatory furnace of the smelter. The why and wherefore for requiring so much less time is that the heat created at first in a reverberatory furnace, by the free admission of air, is so intense that the sulphur is burned as fast as it is liberated, and fuses or vitrifies the compounds and covers particles of undecomposed ore with a sort of cement, which requires intense heat, coupled with long exposure to the action of hot air, to effect their decomposition; whereas, in the "Beam Process," no fusion or vitrification takes place. The particles do not become coated with a cement-like substance, but are accessible to the free action of air, when the proper time has arrived for its free admission, and the chemical changes are effected in a comparatively short time and the gold values are freed and made easily recoverable. I am, dear sir,

Yours respectfully,
(Signed) CHAS. GIBSON, D. Sc.,
Chemist and Metallurgist.



Send for pamphlet giving result of twenty-five tests made at our Denver mill for twenty five different parties, of ores which first passed through the public sampler to determine their values. This advertisement is for the purpose of courting an investigation as to actual results.

WILFLEY CONCENTRATOR. PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

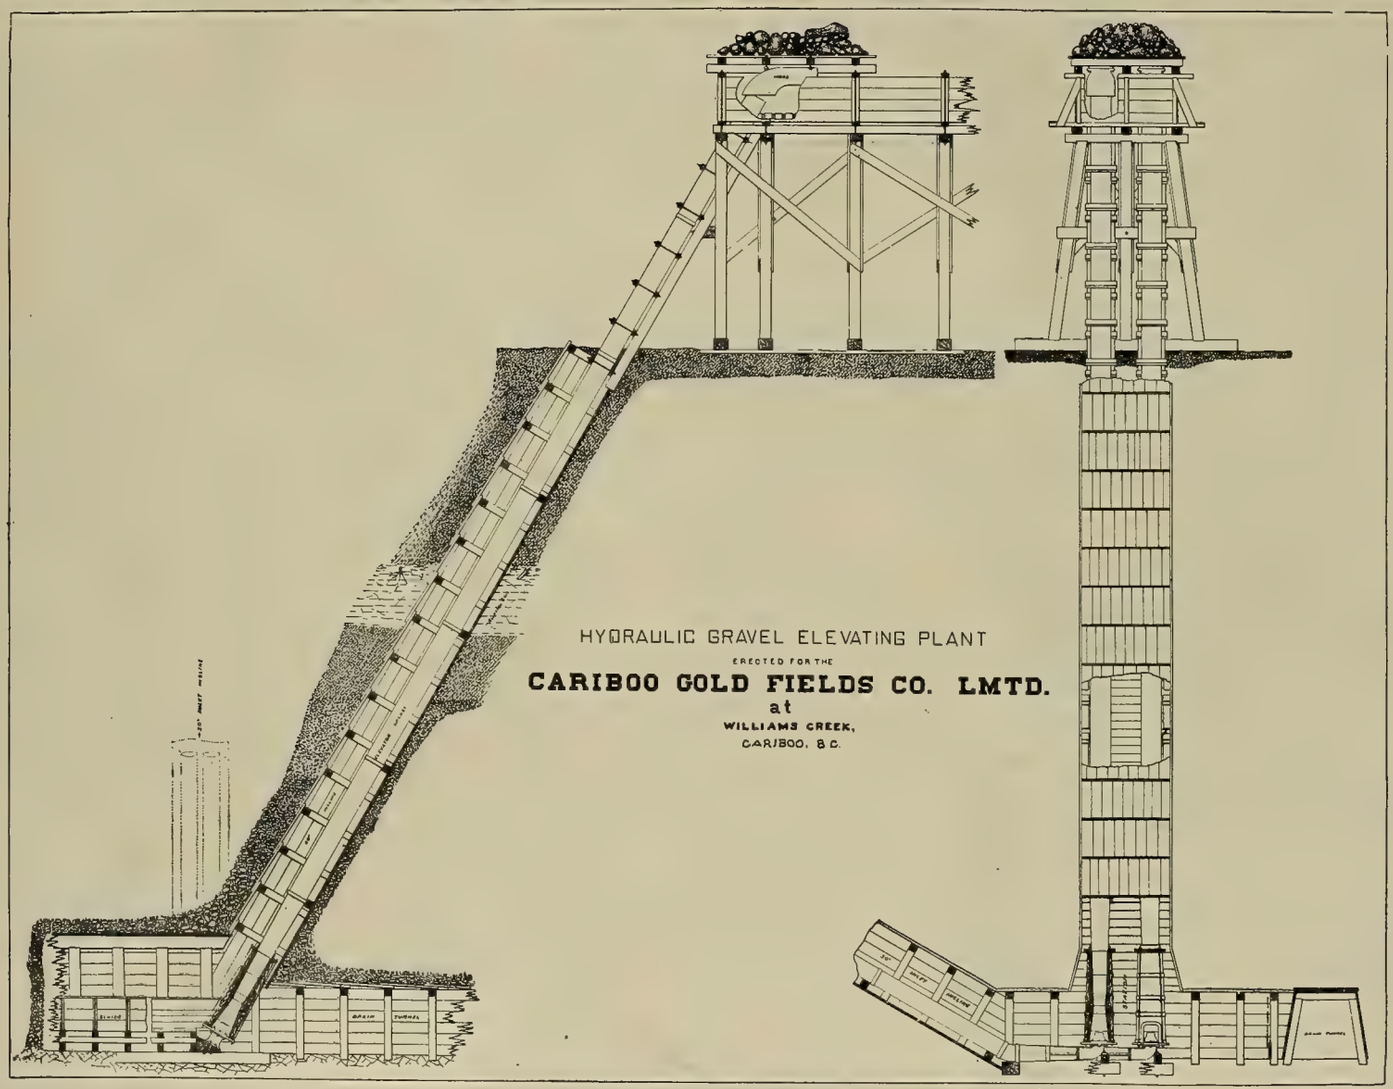
New Apparatus in an Old District.

Written for the MINING AND SCIENTIFIC PRESS.

All old timers will readily recall the Cariboo gold excitement of 1862. But that was thirty-six years ago, and many of the younger generation know but little about it.

It is yet a question whether the rich creeks recently discovered on the Klondike and the Yukon will outrival the rich creeks of Cariboo. It is a matter of history that from two small creeks alone, viz., Williams and Lightning, over forty millions in gold was taken out during the first five years after their discovery, and that, too, from a stretch of less than three miles on each creek. This gold was all taken out by the drifting process, and unlike the frozen creeks of the Klondike, great volumes of water had to be pumped to the surface, at considerable expense while the work of drifting was carried on near the bedrock. The rich strike on Williams creek in the fall of 1861 caused a stampede to the north in the following spring, similar to the present rush to Klondike. The sufferings and hardships endured along those trails and through the rough and dangerous canyons of the Fraser river was something never to be forgotten by those who went to Cariboo in the spring of 1862.

The writer speaks from experience, for he was one of the multitude that sailed from San Francisco, early in the month of June, '62, for Victoria and the Fraser river, there to take up the march for the new El Dorado. Many thousands went and almost as many returned the same year poorer but wiser. A sufficient number remained, however, to operate the mines and many fortunes were quickly made, several camps or towns were built up; the most important, Barkerville, on Williams creek, and Stanly, on Lightning creek, yet remain and do quite a business.



The supplies for Cariboo district are, at present, taken in by teams on wagons in summer and sleighs in winter, over a good road a distance of 300 miles from Ashcroft, a station 200 miles east of Vancouver on the Canadian Pacific Railroad.

Five hundred dollars to the pan sounds like exaggeration, and, as an old miner would say, "it's big ground," but many pans taken from the drifts in several of the claims on Williams creek, when they were paying their best, contained thirty to thirty-five ounces of gold, equal to $500 and over. The Cameron claim on Williams creek was one of the richest. The foreman of that mine during '63 and '64, who handled most of the clean-ups from that mine, is still living in Cariboo. He is considered a very conservative and reliable man. In talking over old times with the writer last summer, he related an instance that occurred one day at the Cameron mine, when they were working in some of the richest ground. Cameron, who was a jolly, good-natured fellow, had a couple of friends visit his claim one day, and after looking it over he said to the foreman, "Jim, take a couple of pans and go down and get each of my friends a pan of dirt." Jim did as he was directed and, wishing to do the thing in good shape, took a miner's candlestick and with the point selected from the face of the drifts two pans of the very best and richest dirt near the bedrock, and taking them to the surface washed them. One of the pans contained thirty ounces and the other thirty-one ounces, over $500 each. At that time other claims on the creek were yielding very largely, and there was considerable excitement throughout all the camps. The packers carried the news down the trails and it soon became heralded throughout the country that $500 to the pan was being taken out on Williams creek. In the Cameron claim the gravel paid from 50 to 100 ounces to the set of timbers, and as high as 150 ounces to the set of timbers was occasionally taken out. Other claims above for a distance of a mile paid nearly as well, and in one of these claims a shaft was sunk from which 140 pounds of gold were taken from the bottom alone. All of the richest portion of this creek was drifted out from one to three sets deep, *i. e.* from 6 to 18 feet nearest the bedrock, and the entire creek for over two miles rests on timbers. Lower down the creek the ground became deeper and more difficult to drain, and when the claims above were drifted out and stopped their pumps the claims below became flooded and were compelled to suspend operations, since which time no drifting has been carried on.

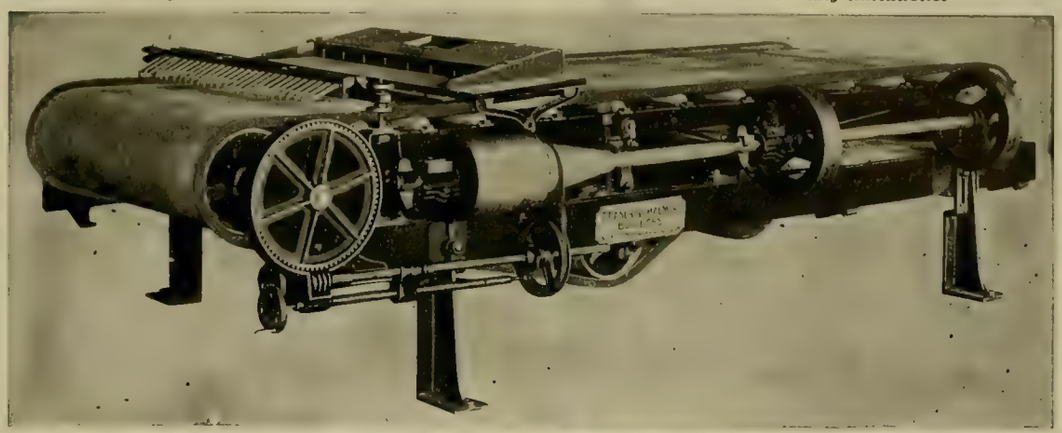
All drifting work on this creek was abandoned in the latter part of the '60 period, since which time numerous small hydraulic claims in the gulches above have deposited some 15 or 20 feet of tailings upon the drifted portion of the creek, once so rich, and to-day there is nothing to denote or indicate that there ever had been any mining done beneath this sea of tailings.

Some five years ago this old drift ground and a considerable portion lower down on the creek was bodied up, and a company formed in London, called the Cariboo Gold Fields, Ltd., took hold with a view of sluicing the entire deposit through hydraulic gravel elevators. The first work to be done was to construct a drain tunnel; to do this required over three years' time and an expenditure of $100,000. In the meantime ditches were constructed for conveying the water to the mine for operating the elevators. Over 12,000 feet of welded wrought iron pipe, 18 to 24 inches in diameter and one-fourth of an inch in thickness, weighing over 600,000 pounds, was shipped direct from England and hauled by teams from Ashcroft, nearly 300 miles, to the mine, costing over $80,000. The company now have two Campbell latest improved hydraulic gravel elevators in position at the mine, with pipe lines all connected with sluices and everything in readiness for water in the spring. The accompanying engraving shows the plant as erected.

The two main pipes that supply the elevators are each 4000 feet long, joints all being leaded; the pressure is 600 feet, which will give an effective head of about 240 pounds to the square inch at the nozzles.

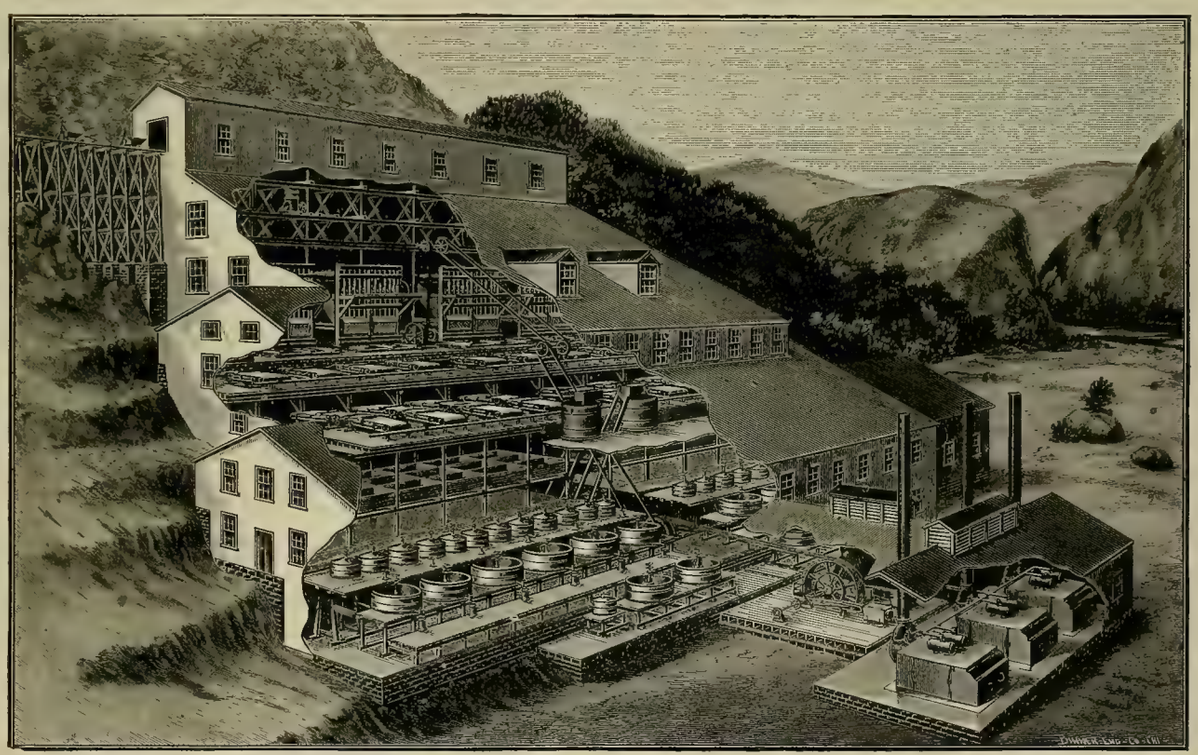
The gravel will be elevated 88 feet, vertical height, and discharged into sluices 4 feet in width, paved with 8-inch blocks and having 3% grade.

Twenty-five hundred inches of water will be required to operate the plant; its capacity will be about 5000 cubic yards of gravel every twenty-four hours. To place the elevator in position inclines were sunk over the head of the drain tunnel to bedrock; here stations were made for the elevators, which were placed in proper position, the connections were all made, and the plant is ready for water in the spring.



The gravel taken from the station where elevators sit was taken to the surface, washed and yielded $8 to the cubic yard. It is estimated that twenty to twenty-five millions of dollars in gold were taken out of Williams creek alone in the '60 period, and the richness of the gravel found lower down on the creek, where the elevators were placed, indicates that there are several millions yet remaining in old Williams creek, which it is expected will all be secured by the elevator process of working. This elevator plant is believed to be the largest and heaviest ever made.

The Parke & Lacy Co. of 21 Fremont street, San Francisco, are the agents for the Campbell elevators on this coast and Australia. R. H. CAMPBELL.



FRASER & CHALMERS, CHICAGO, ILL., U.S.A. and LONDON, ENG.

Is the FRUE Vanner the Best? What do the most important mining and milling companies in America say?

Its words are its deeds. In ALL tests the GENUINE Frue Vanner, built solely by Fraser & Chalmers, Chicago, WON. The Eureka Hill Co., after testing all different makes of Concentrators, have just given Fraser & Chalmers their order for twenty more 6-foot Frue Vanners, the GENUINE FRUE, not one of the many imitations.

The Eureka Hill Co's mill is at Eureka, Utah. This Company knows the value of close concentration and gave the above order after exhaustive competitive tests. (For description of the Eureka Hill Mill, built by Fraser & Chalmers, Chicago, see Fraser & Chalmers' Catalogue No. 29, fourth edition; also see cut below from photograph of mill, as built by Fraser & Chalmers, although used by others in their advertisements.

Among other big mills using GENUINE FRUE VANNERS are—

THE ALASKA TREADWELL—96 Frue Vanners. THE CRESTON COLORADO—52 Frue Vanners.
THE ALASKA MEXICAN—48 Frue Vanners. THE MONTANA MINING CO.—48 Frue Vanners.

There are thousands more, but the above list may be enough to convince mine managers that their interests will be best served by avoiding experiments with imitations and inferior designs, and buying the GENUINE FRUE VANNER of

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

HENDEY-NORTON LATHE.

This LATHE Combines the LATEST and BEST Improvements.

AUTOMATIC STOP.—It is durable, simple, indispensable. It will automatically stop the carriage in either direction. It is equally efficient whether feeding or thread cutting, running up to a shoulder boring to bottom of holes, or internal thread cutting. No danger of spoiling either tool or work. It is a safeguard against accidents in either direction.

CARRIAGE.—The carriage reverses in apron; no slamming of countershaft. There is no comparison between this lathe and the old style or common lathe.

THREADS.—It has all threads in daily use with simple movement of lever.

FEEDS.—Has all feeds in daily use with simple movement of lever. Send for Circular.

MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulas, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Skeleton Mining Report.
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts

Stamp Milling of Gold Ores.
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

The Policy of Miners With Reference to Forest Reservations.

Written for the MINING AND SCIENTIFIC PRESS.

Under the authority of the twenty-fourth section of the act of March 3, 1891, the President of the United States has created several large forest reservations for the purpose of protecting the forests and preserving the sources of water supply. Much valuable mineral land is included within these reservations, and the effect thereof upon the miners of the State is a matter to which I now wish to direct their attention.

It has always been the policy of the United States to reserve from sale or disposal any of the public lands which were needed for Indian, military or other purposes, and while thus reserved the lands were not subject to filing, entry or occupation under any of the laws provided for the disposal of agricultural or mineral lands.

The forest reservation policy is of comparatively recent origin, the first effort in that direction being an act of Congress of September 25, 1890, reserving seven townships in Tulare county, followed by the act of October 1, 1890, creating what is known as the Yosemite National Park, embracing about forty townships in Tuolumne and Mariposa counties.

On the 3rd of March, 1891, Congress passed an act authorizing the President of the United States to create any further reservations when deemed necessary, and under this act President Harrison reserved immense bodies of land on the slopes of the Sierra Nevada, San Gabriel and San Bernardino ranges of mountains. Just before President Cleveland retired from office he made reserves including the western slope of the San Jacinto mountain in Riverside county, and extended the reservation still farther north of the Sierra Nevada range.

These reservations in terms included all of the land within their exterior limits, excepting only those to which title had passed, which would have the effect of preventing any further prospecting or development of the mineral resources not already worked therein. This condition very justly alarmed the miners, and many protests were sent to Washington against these reservations. Special complaint was made against the Yosemite National Park from the fact that there was included in its limits much valuable mining property, and no method provided for the free ingress or egress over the public lands.

I am happy to say that the agitation against and the objections to the forest-reservation policy have been productive of good results. On the 4th of June, 1897, Congress passed an Act in which the following provisions are found:

1. It was declared that as to the reservations already created and those that might hereafter be set aside, it was not the purpose or intent to authorize the inclusion therein of lands more valuable for the mineral therein or for agricultural purposes than for forest purposes.

2. That the Secretary of the Interior should be authorized to sell timber therein for a value fixed by appraisement.

3. That the Secretary of the Interior might permit, under regulations to be prescribed by him, the use of timber and stone found upon such reservations, free of charge, by bona fide settlers, miners, residents and prospectors for minerals, for firewood, fencing, buildings, mining, prospecting and other domestic purposes, as may be needed by such persons for such purposes.

4. That nothing in the Act should be construed as prohibiting actual settlers residing within the boundaries of such reservations crossing the same to or from their property or homes, and such wagon roads or other improvements may be constructed thereon as may be necessary to reach their homes and to utilize their property, under such rules and regulations as may be prescribed by the Secretary of the Interior.

5. That any person may enter the forest reservations for all lawful and proper purposes, including that of prospecting, locating and developing the mineral resources thereon.

6. That settlers therein might maintain schools and churches.

7. That all waters of such reservations might be used for domestic, mining, milling or irrigating purposes.

8. That upon recommendation of the Secretary of the Interior, any of the public lands included within the limits of any forest reservation, which, after due examination by personal inspection of a competent person appointed for that purpose by the Secretary of the Interior, shall be found to be better adapted for mining or agricultural purposes than for forest uses, may be restored to the public domain, and any mineral lands in any forest reservation which have been or which may be shown to be such, and subject to entry under the existing mining laws of the United States and the rules and regulations applying thereto, shall continue to be subject to such location and entry.

This legislation has been brought about principally by the demands of the mining men within the original reservations, and thus every objection that can be urged against these reservations by the miners is obviated. Not only are they made unobjectionable, but the reservations are a decided advantage to the miner, because the lands not mineral are reserved from disposal, and the result is that such lands will be free and open to the prospector for many years to come and as long as the reservations exist.

Let the miners of the State therefore encourage the forest reservation policy, which is regarded as one of great importance to the prosperity of the State.

The most useful purpose served thereby is to prevent the destruction of the undergrowth by the ravages of sheep and fires. This is a real and not an imaginary danger. Extensive forest fires have yearly spread over these mountain ranges, destroying an immense quantity of timber and undergrowth, and the snows which should melt gradually and give a steady supply of water during the summer months are melted with the first warm days of spring, causing great floods and subsequent drouth and the possible prevention of placer and other mining.

The pasturage of sheep in the mountain forests must soon so change the flow of streams heading in these mountains that they will become worthless for irrigation. The sheep are kept in the valleys during the winter months, and are driven into the mountains during the summer. They carry desolation with them: shrubs, small trees and the grasses are eaten to the ground. The sheep men are in the habit of setting fire to the undergrowth, and these fires once under way continue until extinguished by rain, or until they encounter some natural barrier.

By excluding sheep from these reserved mountain ranges, fires will be prevented, the undergrowth will again appear, and the snows will be melted gradually, insuring a continuous flow of water to the farmers of the valleys as well as to the miners.

The California miners are interested in the prosperity of the agriculturists, but these nomadic sheep men are entitled to no sympathy. Let them be confined to the lands they own, and prohibit them from devastating the public lands to the injury of the agriculturists, miners and other productive industries.

A. H. RICKETTS.

Hydraulic Mining.*

NUMBER VI.

Lighting the Washing Pits at Night.—As hydraulic mining is, during the winter season, carried on without interruption, it becomes necessary to illuminate the pits at night. For this purpose great fires of pitch-pine wood were formerly in use, as they are still by all but the larger companies, which have introduced the electric light. When in use this style of light has been found economical, it affording a much stronger as well as a more reliable light than the pine wood.

The Gold-Saving Implements and Appliances.—The gravel brought down by piping finds its way directly into the sluice, small ditches, when necessary, being cut in the bedrock for conducting the admixture of water, sand, gravel and cobbles into the sluice, the boulders and larger cobbles being retained and piled up in the washing pit. The sluice is a race or flume constructed of planks or cut in the bedrock, usually the former, and constitutes, with its appendages, the principal gold-saving agency in hydraulic mining. Formerly the sluice, instead of a continuous race, consisted of a series of small wooden troughs open at both ends, the open end of one fitting into the upper end of another. These troughs, each 12 feet in length, were termed "boxes," and a series of these so joined together was called a string of sluices. When there is so little dirt to be washed that it can be thrown in with a shovel, instead of being piped down and swept in with a strong current of water, as in hydraulic mining, the old style of sluice is used. Ground sluicing consists in breaking down the auriferous earth with a pick or crowbar into a running stream, or by water brought in for the purpose, it is washed, and that generally without the aid of a sluice or any mechanical device.

The size of the sluice depends upon grade, quantity of water, and character of material to be washed; length, within certain limits, on the natural facilities there may be for extending it, and the nature of the gravel, some flumes having a total length of a mile or more. Where the purpose of the sluice is the conveyance of the tailings a long distance below the mine rather than saving the gold, it may have a length of several miles, such prolongation of the main structure being called a tail sluice.

As a general rule, the length of a flume should be sufficient to insure a thorough disintegration of the gravel passing through it, and allow the finer particles of gold to settle in the riffles or be caught by the quicksilver.

A sluice 6 feet wide and 3 feet deep set on a 4 to 6-foot grade will suffice for running 2000 to 3500 miners' inches. One 4 feet wide and 30 inches deep, on a 4 per cent grade, is large enough for 2000 inches, while one 3 feet wide and 2½ feet deep will do for 600 to 1000 inches, the grades and sizes here mentioned denoting those commonly employed.

The following are the rules to be observed in building the sluice as regards mode of construction, size of box, timber, etc.: For sluices 4 feet wide and upward, 1½ to 2-inch plank; sills and posts, 4x5-inch scantling. To guard against the leakage, the bottom planks should be of half-seasoned lumber, grooved, and a dry pine tongue inserted; bottom and sides spiked together with nails 4 inches apart; sills, from 3 to 4 feet apart, according to size of scantling used, which is regulated by the width of the sluice. Thus, a 4-foot sluice would require a sill 7 feet long of 4x5-inch stuff. The posts are halved into the sills and spiked, every second or third post being supported by an angle brace; bottom planks solidly spiked to sills.

To prevent the bottom of a new sluice from being raised by water collecting under it, the flume should be heavily weighted down by loading the projecting ends of the sills with stones. In tunnels, the ends of the sills can be held down by braces extending to the rock above.

The sluice is paved throughout its entire length with wooden blocks and cobbles, the latter selected of a shape and size suitable for the purpose, wooden blocks being always put in at the head of the sluice. The best wood for these blocks is the nut pine of the scrubby species, the fiber of which, being tough and long-grained, "brooms up," that is, wears rough, not smooth, like oak and other hard, fine-grained wood. These blocks, which are square, 8 to 13 inches long, are set on end in rows across the sluice, each row being separated by a space of 1 to 1½ inches. They are held in place by riffle strips 1½ inches thick by 2 or 3 inches wide. These strips are held crosswise on the bottom between the rows of blocks by the side lining and secured to the blocks by means of headless nails. The lining consists of a heavy plank nailed inside the sluice. Block riffles are sometimes kept in position by driving soft pine wedges between them and the sides of the sluice. Where both rocks and wooden blocks are used as riffles, they are set in the sluice in alternate sections. While the cobble riffle is cheaper than the wooden and saves the gold about as well, it requires more time for cleaning up, also a steeper grade, and, therefore, more water. After each cleanup or run, the blocks are turned end for end and replaced in the sluice, their use being continued until they are worn to a length of 4 or 5 inches, when they are no longer deemed serviceable. In placing the blocks in the sluice the alternate rows are fitted so as to break joints.

In some instances scantling placed lengthwise in the sluice have been used for riffles, also worn-out "T" rails, the latter being sought after when obtainable on account of their lasting qualities. When built on a curve, the outer side of a sluice requires to be slightly raised, as in the case of the flume already remarked upon.

The Grizzly.—The first favorable place along the line of the sluice presenting for the location of one of these contrivances is availed of, such place, because of the peculiar conditions required, being not very common. The grizzly consists of a grate of parallel iron bars placed over the sluice-box, its design being to catch and throw aside such cobbles as come down the sluice that are too large to pass through the interstices between the bars. It is this act of flinging off these rocks after the violent manner in which the grizzly bear is supposed to perform a similar act that gave this device its name. To enable this grizzly of the hydraulic miner to well perform its work, there must be a steep declivity close at hand over which the rocks rolling from it can be precipitated out of the way. Beneath the grating is placed a box for receiving the finer material that drops through it, and which is conveyed to a side sluice and by it carried down and returned to the main sluice.

The Drop.—Whenever, along the line of a sluice or the outletting channel below, there comes a considerable descent, this is availed of to give the gravel a precipitate fall—in the technique of the miner, "a drop," the object aimed at here being the breaking up and disintegration of the cemented gravel. The higher and more abrupt the drop the better. In some instances the outflowing material is, by a succession of falls, precipitated to an aggregate depth of 1000 feet or more, sluices and undercurrents being set between these falls where this is practicable.

* Begun in issue of Dec. 18th, '97.

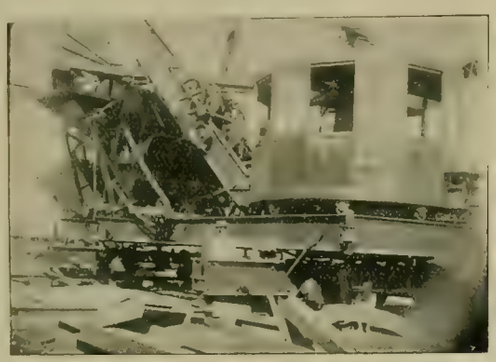
CHAS. FRANCIS SCOFIELD, C. & M. E., President. PROF. SILAS F. POWELL, Vice-President. DANIEL F. COOPER, Secretary.

PLACER MINING

With Improved Electrical Shovel or Dredge and Amalgamator.

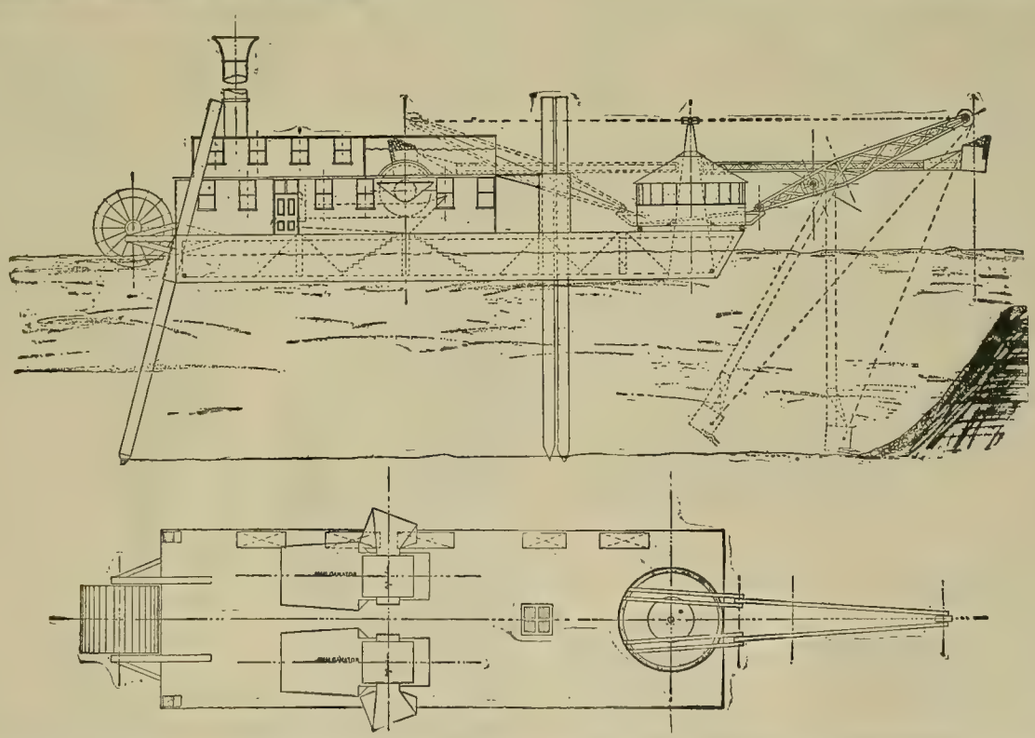
THE BENNETT AMALGAMATOR CO.

OF COLORADO.



CAPITAL STOCK, $10,000,000. **100,000 SHARES.**
Full Paid, Non-Assessable. **Par Value, $100.**

THIS COMPANY having acquired the full and exclusive right under all the patents covering the Bennett Amalgamator system in and for Colorado, is the parent organization to which all other interests in the State are tributary, financially.



EXTENDED EXPERIMENTS having conclusively demonstrated that these plants do all that is claimed for them, the company desires to immediately commence their construction and operation.

A SMALL BLOCK of the stock of this company is now offered for sale for this purpose at the rate of $10 per share, or one-tenth of its par value. With the completion of one machine no more stock will be offered.

NOTE PARTICULARLY—When the machine has been manufactured and set at work, it immediately becomes a source of revenue to the company, as every day's work yields a good surplus of receipts over expenditures.

A SPECIAL ATTRACTION about the investment in this stock is, that no "dead work" is necessary to make a mine for the machine to work on, but it at once becomes a producer of values.

THE FULLEST INQUIRY AND INVESTIGATION INVITED. THIS STOCK, WHILE IN NO SENSE A GAMBLE, OFFERS POSSIBILITIES OF PROFIT FAR BEYOND ANY ORDINARY MINING INVESTMENT, REAL ESTATE OR MANUFACTURING ENTERPRISE.

EVEN IF YOU ARE HEADED FOR KLONDIKE, we can show you how you can utilize this machine to lessen the risk and hardship of the trip and materially enhance the profit of the venture. In knock-down shape it is portable, and can be transported over any wagon road. For further particulars and illustrated circulars.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

Assaying Gold AND Silver Ores.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a coddensed form which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman o practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

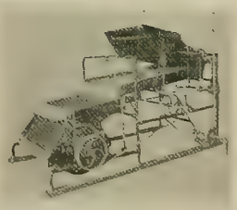
PATENTS



DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,
330 Market Street, San Francisco, Cal.

Pacific Placer Machine.

Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our larger Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb. 400 lb. 550 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

RADEMAKER'S CEMENT GRAVEL MILL.

RADEMAKER'S CEMENT GRAVEL MILL is a new and practical system for the reduction and disintegration of gold-bearing cement gravel which is often found throughout the mining regions; at present there are various devices which are expensive as well as being limited to a small capacity.

Length Over All, 15 Feet; Diameter, 33 Inches; Thirty-Two Hammers.

This mill is constructed in a cylindrical shape, 15 feet in length and 33 inches in diameter, with steel bars running the entire length, and set ¼ inch apart, thereby forming a complete cylindrical screen surface of about *42 square feet*. Attached to the screen bars on the inside of the cylinder are *thirty-two* interchangeable gravity *hammers* placed in opposite position to each other, and running spirally through the entire length of the cylinder. The hammers are *operated* by the *revolving* of the *cylinder* and each independent of the other, and when in motion strike about *550* blows per *minute* of *fifty pounds each;* however, these hammers can be procured of various weights, and in proportion to the solidity of

Sectional View Showing One-Half of Interior and One Row of Hammers.

the material worked. The mill requires from 4 to 5 horse power to operate it. When running at full capacity will handle a maximum of *500 tons* per day. This depends to a certain extent upon the character of the material.

Placed on and near the top of the mill and running over the entire screen surface is a perforated 1¼-inch pipe, and one of the same size leading in at the upper side of the hopper, with a perforated cap with globe valve attached to regulate the continual spray of water that is used and assists in the process of disintegration, and at the same time carries the screened material away as it falls into the steel sluice underneath the cylinder. The cobbles pass through the entire length of the mill and discharge into a separate steel sluice, thereby avoiding all handling or assorting.

The mill when in operation *must* revolve from "*left to right*" when standing facing the *hopper*. The grade of the mill to be determined upon the character of material handled. All parts of this mill subject to the *greatest wear*, are built of *steel*, and is so constructed that it can be taken apart and transported to any locality. Weight of mill is about 7000 pounds. Price f. o. b. S. F. $750.

For further particulars, address

J. M. RADEMAKER, 110 First Street or 211 Kearny Street, San Francisco, Cal.

Market Reports.

The Markets.

SAN FRANCISCO, Jan. 27, 1898.

There is not a branch of trade but reports more business than at the corresponding time last year. The improved call comes from about every point on this coast, as also from Alaska. Very large sales have been made for Alaska, deliverable from February to May, particularly in hog products, which aggregate over one million pounds. It is roughly estimated that Alaska and British Columbia will take from this city, in all kinds of goods, several million dollars' worth this year. A large increase in mining machinery will go forward also. There is quite an exodus for Alaska from several mining districts in this State, particularly from those where there is a light supply of water, owing to dry and freezing weather, but their places will be taken by men coming here from other States.

In the local money market there is practically no change to report. Funds in bank are accumulating notwithstanding considerable money has been withdrawn by persons bound for Alaska and the Northwest Territory. Remittances going forward to the East in the absence of a liberal supply of bills on New York cause a strong market for exchange. The demand for accommodations is light while there is a good inquiry for commercial paper of undoubted standing. The East reports the same there. Selby Smelting & Lead Works say that the gold deposits with them in 1897 were the largest aggregate in the history of the company, but so far this year it is not up to the corresponding time last year although they expect that the total for 1898 will exceed that of 1897. The falling off this year comes chiefly from districts where the water supply has been reduced by dry weather and also by freezing weather. The receipts from the Klondike are in straggling lots as persons coming out from there bring drafts. It is estimated by competent parties that the output of the mines up there before the winter of 1898-99 will run over $10,000,000. There are some who place it considerably higher, more like that of this State in 1849. This will have an appreciable influence on our money market. Besides this confirmed advices state there will be large sums invested in California mines and also that there will be quite a big increase in the outturn by the deep mining mines.

New York Silver Prices.

NEW YORK, Jan. 27. — Following are the closing prices for the week:

	Silver in London.	Silver in N Y
Friday	26⅜	56⅞
Saturday	26¼	56½
Monday	26¼	56¼
Tuesday	26⅛	56¼
Wednesday	26⅛	56¼
Thursday	26 3-16	56⅜

	Copper.	Lead.	Iron.	Tin.
Fri.	10 85 @11 00	3 65	10 00@12 25	13 85
Sat.	10 85 @11 00	3 65	10 00@12 25	13 85
Mon.	10 85 @11 00	3 62½	10 00@12 25	13 85
Tue.	10 85 @11 00	3 62½	10 00@12 25	13 85
Wed.	10 85 @11 00	3 62½	10 00@12 25	13 85
Thur.	10 90 @11 00	3 62½	10 00@12 25	13 85

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	17½c Prem
New York Telegraphic Transfer	20c Prem

London Merchants	$1.81½
London Sight Bankers	$1.85¼
Refined Silver, per oz. 1000 fine	56⅜
Mexican Dollars nominal	47@—

SILVER.—The market has ruled at low prices throughout the week, although at the close it seems to be firmer. It has been unfavorably affected by stringent money markets in India, where there has been quite an appreciable increase in the rates of discount. It is also unfavorably affected by the uncertainty regarding the course of events in China, which lessens the call from that quarter.

MEXICAN DOLLARS.—The market has held to fairly steady prices throughout the week, notwithstanding the light call and weak market for silver.

COPPER. — The markets at home and abroad have not changed in the least the past week. Reports are current that the engineers' strike in England will be soon of the past, which, if proven correct, will cause a better demand from there, although money stringency in India may exert an unfavorable influence. Holders do not press for a market, believing in a better demand later on.

Our market is quoted as follows:

Ingot casting, jobbing	— @13
Ingot " wholesale	— @12½
Sheet copper	— @16½
Bolt ¼ and 5-16, 20c; ⅜ and larger, 16½	

TIN.—The market has held fairly steady. There is a good demand for plate. The East reports that three new plate mills will be in operation this year, which will enlarge the output very materially.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " light, "	4 00@—

QUICKSILVER.—There is nothing new to report in our market.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The market is weak with a small concession obtainable on quotations.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	4 75	@	5 00
Sheet		@	6 50
Pipe	5 30	@	5 80

IRON.—The market is surcharged, both here and in the East. The output of pig at the East is placed at 14,000,000 tons this year.

SHOT.—The market is easy at quotations.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, "	1 60
Buck, Balls and Chilled, do, "	1 60

COAL.—Seattle, Beaver Hill and British Columbia are higher. Light supply of available ships for bringing it here, and large number of the miners going to the Klondike.

Receipts of coal for the week ending Tuesday were as follows in tons: Departure Bay 4900, Coos Bay 450, Nanaimo 4233, Puget Sound 17,299, Swansea 1796, Australia 2146, Cardiff 1847; total, 32,671.

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	7 00@— —
Gilman	6 00@— —
Seattle	6 00@— —
Coos Bay	—@ 5 00
Cannel	9 50@— —
Egg, hard	12 00@— —
Wallsend	6 75@— —

TO ARRIVE—CARGO LOTS.

Australian	5 75
Liverpool Steam	6 75
Scotch Splint	7 50
Cardiff	7 50
Lehigh Lump	12 00
Cumberland, bulk	10 50
Egg, hard	9 50
West Hartley	6 75

COKE.—There is a good demand reported at current quotations.

The market is quoted as follows:

Gas Companies'	— —		— —
English, to load	— —	@	— —
" spot, in bulk	11 00	@	— —
" in sacks	12 00	@	— —
Cumberland	10 00	@	— —

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is firm with a good demand ruling.

The market is quoted as follows:

Refined, in carload lots, in barrels	7
Refined, in carload lots in sacks	6¾
Powdered, in car lots	7
Concentrated, "	6½

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

POWDER.—The market is firm at current quotations.

The market is quoted as follows for Hercules: No. 1, from 11¼c to 17¼c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

Chemicals.

The market begins to show more demand, but as yet the call is for small jobbing lots. New York advices report as follows: "Business of quite good volume is being effected, but there is nothing doing outside of the ordinary line, and prices remain without important variation. The only really interesting feature, in fact, was a report that 40c is being accepted for salicylic acid in some quarters."

CYANIDE OF POTASSIUM.—The market is steady.

Our market is quoted for chemical pure 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The demand is quiet.

We quote in a jobbing way at 1⅛c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6¼@7c per pound in carboys.

BONEASH.—There is a fair demand.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3¼c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firmer.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steadier at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2¼c a pound from stores.

NITRATE OF SODA. — The market is steady.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

TEN WEEKS FOR TEN CENTS!

Strange as it may seem, that big family paper, the *Illustrated Weekly Sentinel*, of Denver, Colorado, (founded 1890) will be sent ten weeks on trial for 10c.; clubs of six, 50c; 12 for $1. Special offer solely to introduce the paper. Gold rings set with Rocky mountain gems are given free as premiums. Latest mining news and illustrations of grand scenery each week, also true stories of love and adventure Address as above and mention PRESS. Write today; postage stamps taken.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bonafide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

OSBORN'S MINERALS, MINES AND MINING.
RECENTLY PUBLISHED:
A Practical Manual of Minerals, Mines and Mining: Comprising Suggestions as to Localities and the Associations of all the Useful Minerals. Full Descriptions of the Most Effective Methods for Both the Qualitative and Quantitative Analyses of Each of these Minerals and Hints upon the Various Operations of Mining, including Architecture and Construction. By Prof. H. S. Osborn, LL.D. Illustrated by 171 engravings. Second edition, revised and enlarged. 393 pages, 8vo. Price.....$4.50
By mail, free of postage, to any address in the world.
ALSO JUST PUBLISHED:
The Prospector's Field Book and Guide in the Search for and the Easy Determination of Ores and other Minerals. By Prof. H. S. Osborn, LL.D. Illustrated by 58 engravings. Third edition, revised and enlarged.
In One volume, 12mo. cloth, 275 pages, price $1.50.
CONTENTS—Chapter I. Preparatory Instruction; II. Crystallography; III. Surveying; IV. Analyses of Ores—Wet Method; V. Special Mineralogy—Gold; VI. Platinum, Etc.—Silver; VII. Copper and How Measured in Ores; VIII. Lead and Tin; IX. Zinc—Iron; X. Mercury, Bismuth, Nickel, Cobalt, and Cadmium; XI. Aluminium, Antimony, Manganese, and Other Minerals; XII. Petroleum, Ozocerite, Asphalt, Peat; XIII. Gems and Precious Stones. Appendix: Weights and Measures; Specific Gravity; Boring; Chemical Elements; Glossary, etc.
☞ *Price $1.50 by mail, free of postage, to any address in the world.*
☞ *Two Circulars of 4 pages each, giving full Tables of Contents of the above books, sent free to any one in any part of the world who will furnish his address.*
WE ALSO PUBLISH:
The Assayer's Guide; or, Practical Directions to Assayers, Miners and Smelters, for Tests and Assays, by Heat and by Wet Processes, of the Ores of all the Principal Metals, of Gold and Silver Coins and Alloys, and of Coal, etc. By Oscar M. Lieber. A new, revised and enlarged edition. Illustrated. 283 pages, 12mo. Price.....$1.50
The Practical Surveyor's Guide: Containing the necessary information to make any person of common capacity a finished land surveyor, without the aid of a teacher. By Andrew Duncan, Land Surveyor and Civil Engineer. A new, revised and greatly enlarged edition. Illustrated by 72 engravings; 214 pages, 12mo. Price.....$1.50
The Assayer's Manual: An Abridged Treatise on the Docimastic Examination of Ores and Furnace and other Artificial Products. By Bruno Kerl, Professor in the Royal School of Mines. Translated from the German by William T. Brannt. Second American edition, edited with extensive additions by F. Lynwood Garrison member of the American Institute of Mining Engineers. Iron and Steel Institute, Verein Deutscher Eisenhuttenleute, etc. Illustrated by 87 engravings; 334 pages, 8vo., cloth. Price.....$3.00
☞ *Our New and Revised Catalogue of Practical and Scientific Books, 92 pages, 8vo., and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

DIVIDEND NOTICE.

JAMISON MINING COMPANY, Rooms 50 and 54, 120 Sutter St., San Francisco, Cal., January 25th, 1898.

DIVIDEND NUMBER ONE.—At their meeting of January 25th, 1898, it was resolved by the Board of Directors of the Jamison Mining Company to pay to the Stockholders of the Company from the surplus funds in the treasury, a dividend of Nineteen Thousand Five Hundred Dollars ($19,500), being Five Cents (5 cts.) per share on the capital stock of the Company. The dividend will be payable at the office of the Company on the Fifteenth (15th) day of February, 1898, to all stockholders of record on the Fifth (5th) day of February, 1898. Transfer books will be closed at the close of business on the 5th of February, and reopened on the morning of February 16, 1898. SAM. W. CHEYNEY, Secretary.

The GOLD DEPOSITS of CALIFORNIA and the KLONDIKE.

The February number of the Engineering Journal of Stanford University will contain five articles on interesting mining subjects. Mr. Wm. Lindgren, of the U. S. Geologic Survey, writes an article on the Gold Deposits of California. Mr. Rufus Buck, a Graduate Mining Engineer of Stanford, writes from Dawson City on the Gold Deposits of the Klondike. Mr. Buck has been on the ground for some time, and if you wish a true statement regarding these Gold Fields you should not fail to read what he has to say. For a copy, send your address and 25c to the Engineering Journal, Stanford University.

Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 3rd day of January, 1898, an assessment (No. 12) of 3 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

THE SAVAGE MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 6th day of January, 1898, an assessment (No. 94) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. B. HOLMES, Secretary.

Office—Room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

FALL RIVER CONSOLIDATED GOLD QUARTZ Company.—Location of principal place of business, San Francisco, California; location of works, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 15th day of January, 1898, an assessment (No. 11) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 313-315 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on THURSDAY, the 21st day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. LORSBACH, Secretary.

Office—313-315 Front street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of January, 1898, an assessment (No. 9) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of February, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

BALIOL GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1898, an assessment (No. 2) of 30 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of March, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. CHENEY, Secretary.

Office—Mills building, room 7, fifth floor, San Francisco, California.

DELINQUENT SALE NOTICE.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Humboldt County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 29th day of November, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Harvey M Blackley	2	1	5 00
Alice E. Binckley	20	4	20 00
Alice E. Binckley	23	20	100 00
Alice E. Binckley	24	20	100 00
Alice E. Binckley	25	20	100 00
Alice E. Binckley	26	20	100 00
Alice E Binckley	39	1	5 00
Alice E. Binckley	40	2	10 00
Caroline S. Townsend	18	20	100 00

And in accordance with law, and an order from the Board of Directors, made on the 29th day of November, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the corporation, 125 Beale street, San Francisco, California, on SATURDAY, the 29th day of January, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from O. M. Henry, in the Murphy Diggings, near Volcano, Amador Co., to deposit tailings in Rancheria Creek; from Geo. A. Gritton, in the Clap Board Gulch Mine, near Volcano, Amador Co., to deposit tailings in Sutter Creek; from Frank J. Goyan, in the Cox Mine, near Placerville, El Dorado Co., to deposit tailings in a ravine; from J. M. Longnecker, in the Hull Placer Mine, near Genesee, Plumas Co., to deposit tailings in a ravine; and from E. Becker and Robert Mooney, in the Homestake Mine, near Amador City, Amador Co., to deposit tailings in Rancheria Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on February 7, 1898, at 1.30 P. M.

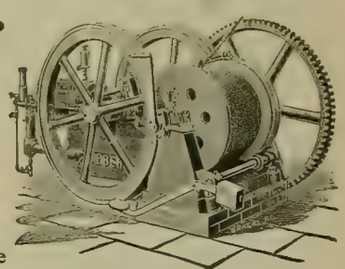
·. Lunkenheimer's .·

Single Bell Chime Whistles

Are unique and handsome in appearance, and produce harmoniously three distinct tones which blend and form a beautiful musical chord. The sound given forth from our style of Chime Whistles, while being more acute and piercing than the common whistle, have not the harsh and disagreeable qualities of the latter and can be heard at a greater distance. The entire bell and dome are cast in one piece, which makes them stronger, more rigid and neater in design than any other whistle on the market.

Specify "Lunkenheimer" make and buy through your dealer.

Made in sizes ranging from 2″ to 10″ diameter of bell in various styles.



Our catalogue will interest you; free for the asking.

WEBER GAS & GASOLINE ENGINE CO., KANSAS CITY, MO.—GENTLEMEN: The 10 H. P. "Weber" Geared Hoist you sent us has been in constant use since May 23rd, and is doing everything guaranteed by you with perfect satisfaction. Besides hoisting the ore and waste from the shaft with three 8-hour shifts sinking it is kept very busy hoisting water, and has never been cooled off since we put it up and started it going. We were then 53 feet deep and we are now 108 feet. It will consume about ten gallons every twenty-four hours of 65 deg. gasoline, but I think when we can procure the 74 deg. gasoline, the consumption of fuel will be less. The engine was put up started and has been run without our ever having seen a gasoline engine in operation before. Neither of the parties now running the hoist had ever had any experience with gasoline, and neither are professional mechanics. The engine hoists the loaded bucket with two men on top with apparent ease, starting loaded as easy as any engine can possibly do. I consider the hoist a complete success, and should I again have use for another engine, this would be my choice. Respectfully yours, GOPHER GOLD MINING COMPANY. Per H. B. Hanna.

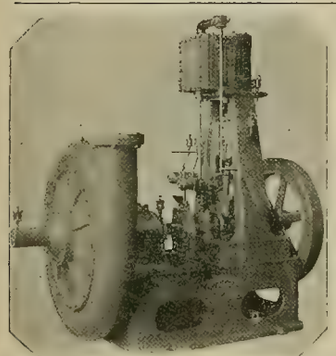
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY.
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.



AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

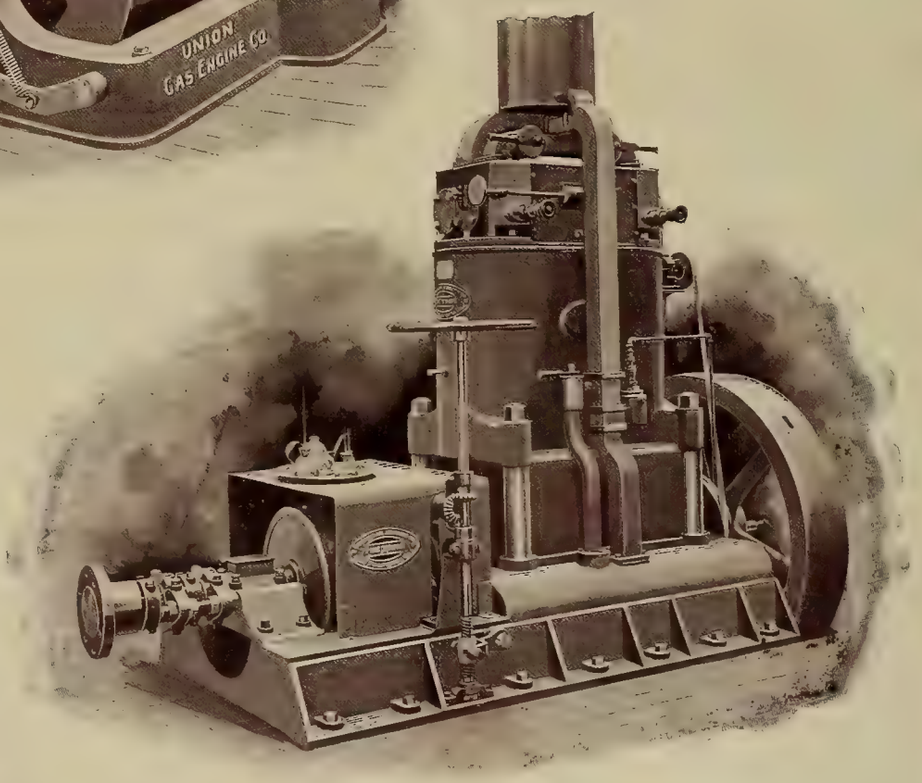
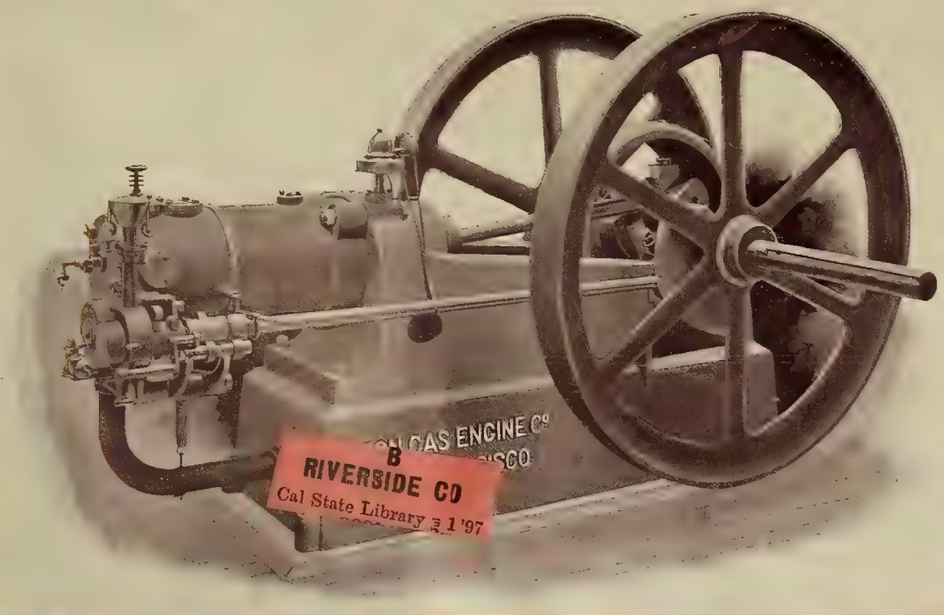
"Union" Hoist.



Union Gas Engine Co.,

314 HOWARD STREET, SAN FRANCISCO.



This 10 H. P. "UNION" HOIST lifts One Ton 125 Feet Per Minute. Works down to 600 feet. Costs about Fifty Cents for 24 hours' hoisting. Weighs 3,500 pounds.

"UNION" MARINE ENGINE 1897 TYPE.

The cut opposite illustrates the latest improved 50 H. P. "UNION" Duplex Marine Engine with dynamo, patented reversing gear, improved vaporizer, adjustable electrodes, governor, ball thrust bearings, combination exhaust muffler and heater, indepeudent throttles and self-starter. It has a heavy forged steel crank, with pistons set opposite to balance each other. Connecting rods of forged steel, with phosphor bronze bearing metal boxes. The lubrication of cylinder and connecting rods is all from one box, with sight feeds. The bright parts are nickeled. Floor space 48x104 inches, including flywheel and thrust bearing. Shipping weight about 11,000 lbs.

"Union" Gas Engines

Use either Manufactured or Natural Gas, Ordinary Stove Gasoline Naphtha or Benzine), Distillate or Kerosene.

This horizontal "UNION" Stationary Engine is our latest product, and is the result of twelve years' experience. It contains a number of new and important features. It is remarkably economical and very steady. It is particularly designed for running dynamos, centrifugal pumps, ventilating fans and machinery requiring steady, reliable and economical power.

Motive Power in Dry Mining Districts.

In many parts of the west half of America, rich in mineral wealth but devoid of fuel and water, the question of motive power is an important one. The gas and gasoline engine, using naptha and crude oil where necessary, greatly aids in the solution of the problem. Herewith is illustrated a recent installation of four gasoline engines for Biddle Reeves, on the Fuller mines, in the Squaw mining district, near Canon, Yavapai Co., Arizona.

Fig. 1 represents a 38 H. P. engine in the mill proper, used to drive the 10-stamp battery and the electric light plant for the mill. The engine is fitted with wiper oilers and indestructible ignition tube, enabling it to make long continuous runs without interruption. Fig. 2 represents a 10 H. P. engine, used to operate a No. 3 Gates crusher, located 300 feet above the millsite at the mouth of the mine, the crushed ore being shot down a chute to the mill. Owing to the nature of the ore, four or five hours' crushing per day suffices for making a 24-hour run at the mill. Fig. 3 represents a 6 H. P. high-speed engine, used exclusively for operating the concentrators, special attention being paid to steady and uniform speed. No other service is required of this engine except the running of the concentrators. This engine is also arranged for long and continuous duty. Fig. 4 represents the isolated pumping station, consisting of a 10 H. P. gasoline engine directly connected to a 5x8 triplex pump. This plant is located 3100 feet from the millsite, where a supply of water is forced to an elevation of 150 feet through 3100 feet of pipe line. This plant has a pumping capacity of 80 gallons water per minute. This water is delivered into a storage tank a little above the mill, where about 10,000 gallons of water is stored, so that in the event of shortage or breakage the mill could continue without interruption until such repairs could be made. The four engines noted above, aggregating 54 H. P. used in the operation of this plant, consume about 100 gallons of gasoline per twenty-four hours, making the total cost of power for twenty-four hours about $17. This mill is located at a point where it would be impossible to use steam, owing to the fact that the water now developed is only sufficient for milling purposes; the saving, therefore, in this class of power is practically unlimited. While the plant described above is at present only operating ten stamps, the machinery is so arranged, together with a surplus of power, that another ten stamps can be added at any time. The plant described above was built and erected by the Weber Gas & Gasoline Engine Co., 430 S. W. Boulevard, Kansas City, Missouri.

THE seventy-fourth meeting of the American Institute of Mining Engineers will be held at Atlantic City, N. J., beginning Feb. 15th, '98. The following is a partial list of the papers thus far announced for this meeting: "Compressed Air Power Transmission at Kellogg, Idaho," by F. W. Bradley, Washington, Cal.; "Camp Floyd Gold Deposits, Mercur, Utah," by E. A. Wall, Salt Lake City, Utah; "A New Form of Ingot Mould for Casting Brass or Bronze Ingots, with Remarks on the General Form of Ingots," by Erwin S. Sperry, Bridgeport, Conn.; "Emery, Chrome, Ore and Other Minerals in the Villayet of Aidin, Asia Minor," by W. F. A. Thomae, London, England; "The Bildt Automatic Feed Device for Gas Producers," by C. W. Bildt, Worcester, Mass.; "Notes on the Caucasus," by Dr. Persifor Frazer, Philadelphia, Pa.; "Apparatus for Removing the Sand from the Waste Water of Ore Washers," by J. E. Johnson, Jr., Longdale, Va.; "The Influence of Antimony on the Cold Shortness of Brass," by Erwin S. Sperry, Bridgeport, Conn.; "The Ultimate and Rational Analysis of Clays and Their Relative Value," by Heinrich Ries, New York City; "Mining Districts of Colombia," by H. G. Granger and E. B. Treville, Quibdo, Colombia, S. A.; "A New Departure in Breaker Building at Cranberry Coal Mine, Hazleton, Pa.," by W. S. Ayres, Hazleton, Pa.; "A Study of the Elimination of Impurities in the Reverberatory and Convertor Processes of Copper Production from Copper Matte," by Edward Keller, Baltimore, Md.; "Note on Limonite Pseudomorphs from Dutch Guiana," by R. W. Raymond, New York City; "The Manganese Ore Industry of the Caucasus," by Frank Drake, New York City; "Mining Timber and the Forest Reserves," by Gifford Pinchot, Washington, D. C.; "Some Peculiar Occurrences of Gold Ore in Montana," by W. H. Weed, Washington, D. C.

A PETITION by a stockholder and bondholder of an insolvent company to inspect a mine, either in person or by agent, with a view to having the receiver in charge of such company removed, is in the nature of a motion for the production by parties of books or writings in their possession; and being made by a party in interest, and therefore entitled to the knowledge sought, will be granted by a United States court.

WITH pardonable pride, the New York *Evening Post* takes a page to advertise the fact that its issue of Dec. 11, '97, contained 30,813 lines of displayed advertising, which was very good. Last week's issue of the MINING AND SCIENTIFIC PRESS contained 85,456 lines of displayed advertising.

THERE is nothing in the recent widely published statement that gold dredging machines would not be allowed in the Yukon region.

THE administration is in favor of establishing an assay office somewhere on the Yukon this season. Seattle, Wash., had been making a fight for the institution to be located there, but without success.

THE little rain of the week is of no practical benefit to the California miner. For an average season's work considerable rain and snow are necessary, and so far this winter there has been practically none.

THE Spanish mine, Nevada county, Cal., is a good example of a cheaply worked property, though the exceptional conditions favor a lower cost than ordinary. At present twelve men furnish the mill with 270 tons of ore daily, which is mined and milled at a total cost of 65 cents per ton.

THE California State Mining Bureau, including the museum, is to be removed to the new union depot at the foot of Market street, San Francisco, from its present location in the Pioneer building, on Fourth street, where a monthly rental of $250 has been paid for many years. In its new location the State will charge the bureau $100 per month.

IT is neither the province nor the purpose of this paper to note or contradict the innumerable incorrect statements made regarding mining matters, but it is in order to say that the recent flaming statement that a national smelting trust had been organized, and that all the smelters would be under one management, etc., has no foundation in fact.

THE best procurable statistics give the yield of gold in California for the calendar year 1893 as aggregating $12,422,810; for '94, $13,923,282; '95, $15,334,422; '96, $17,343,280. For '97 the yield is variously estimated at from $18,000,000 to $18,500,000. It will be some weeks yet before the statistics by counties can be secured. The extreme cold and unusual drought of the last sixty days of the year curtailed the production of all classes of gold mines in this State.

RECENT statements in this paper regarding the date of the discovery of gold in this State by Marshall are the subject of some remarks by Mr. E. E. Chever on page 158 of this issue. Mr. Chever's statements are entitled to the most respectful consideration. The question has been fully discussed and has formed a matter of contention for some years. The case stands thus: Marshall himself on several occasions signed positive statements that the discovery was made on the 19th of January, 1848; and some months before his death, in an interview with the editor of this paper, reiterated the assertion. His companions with him at the time—four of whom have been in this city during the week—say that the 24th of January was the date the discovery was made. Thus there seems to be a hopeless division of opinion; but now that the Golden Jubilee and its attendant publicity stamped the 24th of January as the fiftieth anniversary of the great event, it is probable that that date will continue to be observed.

RIVER IMPROVEMENT is still in the circumlocution office. The opinion of the California attorney-general is being sought as to whether the State Board of Public Works must comply with the explicit provisions of the law making the State appropriation of $550,000, and the opinion of the Attorney-General of the United States is asked as to how vouchers should be drawn for the work as done. Meanwhile nothing is done but talk, the money lies idle, and mountain and valley residents regretfully view the prospect of the whole thing being a heritage to posterity.

LAST Tuesday a conference committee from all the commercial bodies of San Francisco met to consider the proper representation of California at the Omaha Exposition, resulting in the appointment of a committee to make preliminary arrangements. The movement is essential to the State. This is the age of advertising, and California has something to advertise. A showing of mineral products such as is now on exhibition at the Golden Jubilee Mining Fair would be of value to the commonwealth if seen by 3,000,000 people at Omaha next summer.

THE Klondike craze must run its course. Advice or argument is useless. Those who propose going will see it through. The energy, money and tenacity of purpose could better be expended at home, but the indirect result will be favorable to the coast. The whole thing is part of a liberal education, and those who come back, whether they have money or not, if they have enough health or vigor remaining after that cruel experience, will aid in the material development of this region. Transportation companies and furnishers of all kinds of supplies will make money this season.

RECENTLY a supervisor of Yuba county, Cal., presented a bill for time attending a meeting of the Anti-Debris Association. The bill was rejected; suit was brought, and in the Superior Court judgment was in favor of the county. On appeal the Supreme Court of the State sustained the decision, the unanimous opinion of the justices being virtually that the Anti-Debris Association had no legal existence, and the expenditure of any public county or State money in connection therewith was not legally within the power of any county or State official. This is a new phase of an old question. As a matter of fact as well as of law, the residents of any California county who believe in hydraulic mining have the same right to have public money appropriated to aid their views, as opponents of that system have, that is, no right at all, in law. As the thing has gone on for many years, sundry residents of the State pay taxes which are illegally applied to oppress, harass and destroy a part of the community supplying the money—the money that goes for salaries being the chief incentive to the continuance of the organization on the part of those to whom the salaries are paid.

THE President of the United States, on last Saturday evening, touched a button at the seat of national government, 3200 miles away, and set in motion the machinery of the Golden Jubilee Mining Fair at Mechanics' Pavilion in San Francisco. It is estimated that ten thousand people were present. The Fair will continue until March 5th. So much has been said about it in these columns that it is deemed but necessary to reiterate an invitation to all who can to visit it. Wherever the eye turns will be found much of interest. Some of California's famous gold-producing counties—among them Amador, Nevada, Calaveras, Tuolumne, Yuba and Butte—have fine exhibits of gold arranged in striking forms. Some of our leading mining machinery manufacturers have apparatus in full operation. The North Bloomfield hydraulic mine, the largest property of the kind in the world, has been faithfully reproduced. This alone is worth seeing. There are numerous mining devices in operation; the State Mining Bureau has a fine exhibit, and anyone contemplating a journey to the Yukon can save considerable money and catch on to a good many up-to-date ideas by a visit. February 22nd will be Miners' Day at the exposition, at which time there will be drilling contests, tool sharpening contests, Cornish wrestling, etc., for cash prizes.

AN opinion of some interest to miners and prospectors was last week rendered by Federal Judge Hanford at Seattle, Wash, in a suit brought against T. H. Mallory by M. A. Cisna and seven other citizens of Spokane for a share in the mining claims owned by Mallory in Klondike district. The principal point involved in the case was how long does a grub-stake contract last, no limitation being set in the terms of the agreement. In deciding the case Judge Hanford said: "I consider that the contract cannot be fairly construed so as to create any right in favor of plaintiffs to property situated in a distant foreign country, purchased by Mallory with his own money more than two years after the agreement was entered into. Grub-stake contracts will be enforced by the courts, but only as other contracts." The court concluded by holding that the showing made by the plaintiffs was insufficient, and the application for an injunction pende lite was denied, the plain English of the whole thing being that, in Judge Hanford's opinion, there must be a definite limit to a "grub-stake" agreement.

IT requires nimble wits to keep up with the consecutive rulings of the administration regarding mining requirements. Recently the Secretary of the Interior ruled that any one wishing to patent a group of claims could do all the development work on one claim, if it tended to develop the entire group, and was virtually only required to make an expenditure of $500 for work or labor or improvement on each group of claims, but the regulations of the general land office, approved Dec. 15th, '97, now require that no less than $500 worth of work or labor shall be expended on improvements made upon each claim before entitled to patent. Paragraph 53 of the general land office regulations reads as follows: "The claimant, either at the time of filing these papers with the register, or at any time during the sixty days' publication, is required to file a certificate of the surveyor-general that not less than $500 worth of labor has been expended or improvements made upon the claim, and if more than one claim is included in the application, that an amount equal to $500 for each claim has been expended by the applicant or his grantors; that the plat filed by the claimant is correct; that the field notes of the survey, as filed, furnish such accurate description of the claim as will, if incorporated into a patent, serve to fully identify the premises, and that such reference is made therein to natural objects or permanent monuments as will perpetuate and fix the locus thereof."

NOT the least among the pleasant memories of the recent great celebration of the 50th anniversary of the discovery of gold in this State are the kindly comments of the leading newspapers in California's sister States. Long and gracefully worded editorials congratulatory and commendatory appeared last week in many contemporaries. The Salt Lake, Utah, *Tribune* closes an exceedingly fine article by saying:

It is right for the children of the great State to celebrate; right for them to glorify their State and themselves for being children of the State; right for them to call over the names that made the early history glorious, and to look with hopeful eyes toward a future which seems to have no cloud upon its horizon, and only new bounties in its gifts.

In like manner, in the course of its editorial remarks, the Denver, Colorado, *Republican* says:

It is with good reason that the people of California are celebrating the 50th anniversary of the discovery of gold in that State. That discovery was the birth of a new community which soon attained to the dignity of statehood, and that since has grown to be one of the great and prosperous members of the American Union. California has not exhausted the wealth of its gold mines, but it has found in other industries sources of revenue as great as the sands of its rivers and the mineral veins of its hills. It has become a great, wealthy and populous State. Its name has become almost a synonym for riches, and the greatness and the glory of its future are assured.

Other leading journals elsewhere comment in the same eulogistic strain, and, apart from the truth of the statements, the kindly spirit that actuates those utterances is heartily appreciated.

The Deep Levels of the Comstock Lode.

The following editorial paragraph appeared in last week's issue:

The greatest depth ever attained on the Comstock, Nevada, lode was in the Union Con., in the north end—3350 feet—just fifteen years ago, when the clamor for dividends caused the mines to be allowed to fill with water. Many miners argue with considerable show of reason that to unwater and push deeper would unearth a third bonanza.

The above paragraph briefly expresses the present status. Unusual interest attaches to this matter, the advisability of such action being warmly advocated. In view of the importance of the subject is herewith reproduced a statement of facts in connection with this whole matter:

The impression prevails even on this coast that the Comstock lode has been explored to the greatest depth possible; that with the exception of a few scattering streaks and bunches of ore in old levels above the Sutro tunnel the mines are exhausted. Some say that at the depth of 3000 feet, or a little below, the lode pinched out; others, that at the depth of about 3000 feet only barren quartz was found. But the notion most generally prevalent is that at the bottom of the deep shafts such rivers of water were tapped that the mines were all flooded and the miners drowned out, no pumps being capable of handling water that poured in from the subterranean depths. The conclusion arrived at by the majority of outsiders is that in depth the Comstock is dead and that work can never again be done on the great lode below the points where sinking was suspended in the Jacket, Union, Combination, and other deep shafts.

The fact is that the big lode is still alive and should be pumped out and work at depth resumed. With the water out of the mines there is nothing to prevent the exploration of the lode to the depth of 6000 feet or more below the surface. A great mistake was made when pumping was stopped and the mines allowed to fill with water to the level of the Sutro drain tunnel. In resuming work on the lode at depth the greatest expense will be in draining the shafts, drifts and other openings of the water that has accumulated in them. Most of these openings, however, are at no great depth below the level of the Sutro tunnel and when they have been pumped out only the shafts will remain to be drained. As the water will at first have to be lifted but a short distance, it may be raised very rapidly by putting in a number of pumps to be run by electricity or compressed air. Such pumps may be used until the long drifts, crosscuts, winzes and other openings of the old submerged levels are drained, when it will only remain to pump out the shafts.

Although the mining men of the Comstock have always claimed to be world beaters, they failed to "fill the bill" when they backed out of their line of big shafts at the depth of 3000 to 3300 feet. They then took a back seat and have since been passed by the miners of Lake Superior and Australia. Doubtless they could have gone ahead had the order been given to continue, but the stockholders hungered for dividends and clamored for a return to the old upper levels (above the Sutro drain tunnel), where it was known that large amounts of paying ore had been left behind in the race after depth. So the work of exploration was stopped and the miners set to work on the sure thing to be found in the ore bodies lying high and dry in the old upper levels.

There was no trouble in handling the water at the bottom of any one of those deep shafts. The water that flooded the mines of the south end of the Comstock lode came in at a point 350 feet above the bottom of the Yellow Jacket new shaft, the deepest on that division of the lode. February 13, 1882, an immense "pocket" or reservoir of water was blundered into in a drift that was being run from the Jacket shaft into the Exchequer mine on the 2700 level. The Yellow Jacket shaft was at that time 3050 feet deep; the water from the Exchequer thundered down into it and caused the stoppage of all operations except pumping. The Jacket people pumped and bailed an average flow of 110 miners' inches a day for some days, yet the water gained on them and eventually raised to the source of supply on the 2700 level of the Exchequer. The water then filled all the mines of the Gold Hill end of the lode.

Pumping was continued, however, in order to exhaust the subterranean reservoirs in the Exchequer, till March 28, when the water had been so far lowered that it stood only 950 feet above the 3000 level of the Jacket shaft. Then, as no combined arrangement could be made among the several companies intrusted to continue the work and drain all the mines, the Jacket Company stopped pumping and shut down their works. This stopped all work below the level of the Sutro tunnel in the whole line of south-end mines, and they still remain flooded.

Had proper precaution been observed by the Exchequer people and a drill-hole kept in advance in the drift, there would have been no trouble. In such a situation a diamond drill should have been constantly employed in "feeling ahead" for water. When water was tapped, the drill-hole could either have been plugged up or a pipe and cock could have been put in and the flow drawn off as it could be handled. To blunder into such a big body of water was a piece of very bad management.

The return to the old upper levels was not a bad move, as good bodies of ore were found and an immense amount of bullion was obtained. New bodies of ore were found in the Consolidated Virginia & California, Hale & Norcross, Confidence, Yellow Jacket, Crown Point, Gould & Curry, Savage, Chollar, Best & Belcher and some others. The Con. Cal. & Virginia paid steadily $108,000 monthly in dividends; the Confidence and Hale & Norcross paid dividends in 1888 at the rate of $49,000 to $50,000 a month, and some others paid smaller amounts. At that time nineteen mines were at once producing ore—more than ever before at any one time in the history of the lode. A few examples will show the rate at which some of the mines yilded from the old upper levels after the return to them: Con. Cal. & Virginia, in 1888, for the quarter ending March 31, $921,903; Chollar, $21,795; Confidence, $42,541; Hale & Norcross, $236,047, Kentuck, $13,055; Potosi, $56,461; Yellow Jacket, $121,027. For the quarter ending June 30, the same year, several mines did still better, the Hale & Norcross producing $451,740 and the Confidence $401,293. During the year the Comstock payroll aggregated from $250,000 to $300,000 a month. Thus it will be seen that the stockholders were not much to blame for wishing to cease pumping water for a time and go back to the "fleshpots" of the dry upper levels.

At the time when operations were discontinued in the deep shafts and a return made to the old upper levels the Combination shaft had reached the vertical depth of 3250 feet. At that time there was but one deeper vertical shaft in the world—the Adalbert shaft in the silver mines of Bohemia, which was at that time 3280 feet deep, but has now reached a depth of 3672 feet. At the Combination shaft drifts were run west to the lode at the 2400, 2800 and 3000 levels. On the 3000 level the distance from the shaft to the east wall of the lode was found to be only 250 feet. The lode at this depth was of undiminished width and well mineralized; indeed, the Hale & Norcross Company (through whose ground the drift was run) had a good showing of ore. So much for the story of the lode pinching out at depth. In the Belcher mine, south of the Jacket, excellent prospects were being obtained on the 3000 level when the Exchequer people let it the water and flooded the whole south end of the lode.

In the deepest workings on the leading mines of the Comstock from the Union Consolidated south to the mines of Gold Hill the lode was found to hold its width, and at several points was well mineralized on the 3000 level, as at the Hale & Norcross where they had a good showing of ore when the order for a shutdown and return to the old upper levels came. On the 3000 level of the Belcher good streaks and bunches of ore were making their appearance when the mine was flooded by the rush of water from the Exchequer. Though no rich bonanzas were in sight, there were no discouraging features developed. At the Union Consolidated a change in the appearance of the material composing the vein was observed, which by some was considered unfavorable, as in the assays there was a falling off in silver and an increase in gold. The increase in gold was to the northward, and it is now thought that had work been continued paying gold-bearing quartz would have been developed. At that time, however, gold alone was not being much sought after.

No gold or silver lode has ever been found which showed paying ore continuously in all parts at the same time. Between bonanzas there is always a zone of barren or low-grade quartz. It is probable that another line of bonanzas would come in a short distance below the zone reached in the Union Consolidated, Combination, Jacket and other deep shafts. The indications were that they were on the top of ore bodies at the Hale & Norcross and Belcher when work was stopded. There is nothing to prevent the drainage of the lower levels of either the Gold Hill or Virginia mines. No water exists in the mines above the 1600 (Sutro tunnel) level, therefore all there is to be handled is the dead water which has gradually accumulated in the shafts, drifts and other openings. Pumping operations at the Alta, Crown Point and other mines have shown that a single company was able to lower the water. Had other companies stood in with the Alta or the Crown Point at the time they were pumping the whole of the Gold Hill mines would have very speedily been drained.

At the time the only example in deep mining that Comstock men could look to for light was the Adalbert shaft, Bohemia, and that was only 3280 feet vertical, but 30 feet deeper than the Combination shaft when work was stopped. Now we have at Lake Superior the Calumet & Hecla shaft, 4900 feet in depth; the Tamarack, 4450 feet, the Adalbert, Bohemia, 3672, and several other mines (principally coal) from 3600 to 3900. The Bendigo gold mine, Australia, has reached a vertical depth of 3350 and is still going down in good pay. With advanced methods and improved machinery no one now sees an end to the depth that may be obtained. In other regions the miners are still going ahead, and many of them are now far beyond the point where the Comstocker halted.

By means of the Sutro tunnel a new and lower working surface has been created. The water pumped has only to be raised to this new surface, and through two miles of branch tunnels and many connections with shafts and winzes. There is everywhere a good circulation of pure fresh air. It is as though 1600 feet of ground had been cut out and removed. All kinds of mining work can be done on this new artificial surface as well as above on the old natural surface. This being the case we find that the deepest workings on the Union Consolidated have a depth of only 1750 feet below the new working surface, and that a shaft 3000 feet deep, measuring from the old natural surface, is only 1400 feet deep when measured from the new surface. By means of the Sutro tunnel, its two miles of branches along the lode and its many air connections through shafts and winzes, a base of operation has been established from which it will be as easy to sink to a depth of 3000 feet as it was to sink to that depth from the natural surface.

Flood, Hayward, Mackay, Hobart, with other mining men and many operators in mining stocks that might be mentioned, were in 1891 very enthusiastic in regard to a return to the deep levels; the chances are now as good as they then were—whatever ore bodies were then in the deep levels are still there, and should be looked for. The whole of the mines on the lode need not be opened at once. The Gold Hill mines might be first pumped out, or work resumed in certain sections of the Virginia City division of the lode, starting wherever there was some ore in sight when work was discontinued. As the accumulations of water in the shafts and drifts are not from living streams, to pump them out is like pumping out a cistern. As things now stand, no one knows but that work in the deep shafts may have stopped just on the apex of a third line of bonanzas richer than any found above.

SOMETHING unusual in mining is reported from the Lake Superior, Mich., copper district, where deep shafts are common. The Quincy Mining Co., according to local reports, is to "dig a shaft 4000 feet high." A new shaft 4000 feet in depth at an angle of 43° was recently decided upon, and, after considerable discussion, the plan of Manager Harris was acted upon, viz: to begin 4000 feet below the brow of the hill and start drilling upward to the surface for the distance mentioned, which will constitute a gigantic upraise, even if not entitled to be called a shaft.

Placer Mining by Machinery.

Written for the MINING AND SCIENTIFIC PRESS.

The oldest of all engineering problems is how cheaply can earth or gravel be handled. It interested alike the first tiller of the soil and the first placer miner. Where all natural facilities are present—ample grade and "dump," sufficient water with good hydrostatic pressure—gravel can be handled more economically by hydraulic methods than by any other means yet devised. These natural advantages were utilized by the pioneer miners of California to work the auriferous alluvial deposits of the shallower gulches and bars, and enabled those who followed them to wash down mountains of alluvial detritus to recover the gold. When the most favorable of these deposits were worked out, the early miners sought new fields in British Columbia, Boise Basin (Idaho), Alder Gulch (Montana), and many other places where favorable conditions for placer mining existed. But in almost every district where work was done considerable areas of auriferous gravels were left unworked, owing to the deposits being located in the beds of streams or from their lack of sufficient grade and "dump," or on account of there being but little available water. The working of such deposits attracted the attention of the mechanical engineer in 1857, when the first dredging plant was placed in one of the rivers in California to dredge for gold. Since that time almost every form of device for handling gravel has been used in the multifarious attempts to work both drained and subaqueous deposits.

Millions of dollars were expended in this country between the years 1857 and 1894 in the mechanical appliances adopted to work gold-bearing detrital deposits, resulting mostly in blighted hopes and depleted pockets, and there is probably not a single field for the application of mechanical devices where so many and varied attempts were made at so great an expenditure of time and money that resulted in so little progress being made as in that. In fact, the successive failures only demonstrated the inadequacy of many of the appliances and methods employed.

It is not the purpose of this article to discredit or unduly criticise any honest effort made in the past toward working auriferous deposits by mechanical means, but to review briefly some of the methods adopted which have so often resulted in disappointment and loss, and endeavor to point out lines which can be safely followed, insuring success in proportion to the care used in adopting proper mechanical methods to work such deposits. Until within a comparatively short time the results of almost every attempt have proved unsatisfactory, through either inability to recover the gold with the gravel when working under water or failure to recover the gold from the gravel effectively and economically when working drained deposits.

The latter difficulty has been overcome, as will be shown; and, where the bedrock is soft, some progress has been made toward surmounting the first obstacle. But how to recover the gold from hard, rough bedrock, in submerged work, remains the same complex problem. Previous to 1894, these plants were generally designed by mechanical engineers, whose early education in placer mining had been neglected, or by placer miners, who knew but little of the practical application of mechanics, and sometimes by promoters, whose chief aim was profit to themselves regardless of loss to others. For subaqueous workings, dipper dredges have seldom produced satisfactory results, owing to it being impracticable to make the door of the dipper or shovel to close tightly, consequently a considerable percentage of the gold would wash out with the water and could not be recovered. This difficulty has been somewhat overcome by working down stream instead of working against the currents, which has been so generally practiced; and in breaking or disturbing the gravel under water, the gold would settle to bedrock, where the dipper could not recover it unless the bed was clay or decomposed rock. Dredges, fitted with clam shells and grappling devices, have failed for the same reasons. Suction dredges and centrifugal pumps, of which probably a greater number have been tried than any other single device, have demonstrated that they would pump large quantities of water, some gravel and but little of that most sought for—gold. Some of the best authorities on centrifugal pumps still contend that they have great possibilities in handling solids. But the placer miner had better let those experts demonstrate the capacity and efficiency of such pumps in auriferous gravels at their own expense. Elevator or ladder dredges have been working successfully in New Zealand rivers for some time, and some of these plants, located in Grasshopper gulch near Bannack, Mont., are working profitably; but the financial results attained by them should probably be credited more to the quantity of gold in the gravel handled than to perfection of design or high standard of the mechanism used. It is not a difficult problem to work gravel profitably, where it contains several dollars per cubic yard, and some of the Grasshopper gulch deposits are as rich in gold as the Klondike alluviums. Some of these plants contain a greater number of engines and more machinery than is necessary to do the work properly. Better results could be attained with less complicated machinery. When a large centrifugal pump is used on a placer mining dredge, for the sole purpose of disintegrating and washing the clay from the gravel, the designer of such plant has something yet to learn in placer mining engineering. Some of these plants have been remodelled several times, and improvements in their design and the machinery used are certain to follow. An elevator dredge has recently been placed on the Yuba river, Cal., which shows decided improvement and demonstrates the value of experience with such plants, as the designer has spent several years in that line in New Zealand.

While we have not all the desired data regarding the cost of subaqueous workings under the varying conditions existing in different localities, sufficient has been done to demonstrate that, where auriferous gravels are underlaid with clay or decomposed bedrock, plants can be constructed to excavate and wash the gravel successfully.

There have been many attempts made to work such deposits with standard steam shovels and auxiliary machinery, such plants having generally included from two to four steam boilers, two to five engines and one to three centrifugal pumps each. They have mostly proved so inefficient and expensive to operate that they were abandoned, although frequently working rich gravel. It has been demonstrated that such deposits can be worked very profitably with a properly designed plant, having but one steam boiler, one set of dredging engines and without any pumps whatever. Hydraulic gravel elevators have frequently been used in endeavoring to overcome obstacles, caused by the failure of natural forces, to provide sufficient grade and proper space for "dump." Under the most favorable conditions, a few of these devices prove efficient and the results attained are profitable. But a greater number failed owing to the natural requirements for their successful operation being so great and the requisite combination of conditions so seldom found. Whether auriferous detrital deposits, where the bedrock can be drained, should be worked by traction dredges placed on bedrock, or by floating dredges, requires but little discussion to demonstrate that practically everything is in favor of the former method. For working such deposits few advantages in favor of a floating dredge can be established. Under some conditions it will handle the material at less cost per cubic yard—a matter of subordinate economic importance, when in almost every instance the value of the gold, not recovered from bedrock by a floating plant, is far in excess of any lessened cost of operation; and where the alluvial deposits are underlaid with hard, rough bedrock—Nature's best riffles—generally not more than 50% of the gold can be recovered by subaqueous working. It is on and in such bedrock where the greater quantity of gold is to be found. The water is necessarily made muddy by the operations, which are entirely blind, and under such conditions it is absolutely impossible to clean or crevice the bedrock. The area of unworked auriferous gravel deposits which can be drained is much greater than that below the drainage level. Drained gravels can be "prospected" and their values determined at comparatively small cost, while it is practically impossible to properly "prospect" submerged deposits; hence, the working of drained gravels is a much safer and more profitable proposition, generally, than the exploitation of subaqueous deposits can be. Nearly all unworked auriferous alluviums in old placer mining districts have a top burden of barren clay and gravel, and in many localities there is but little available water for sluicing. Under such conditions it is worse than useless to wash gravel that has no "pay" in it.

FIG. 1.—DIPPER DUMPING "PAY" GRAVEL INTO CAR.

FIG. 2.—DIPPER DUMPING TOP BARREN MATERIAL AT SIDE OF EXCAVATION.

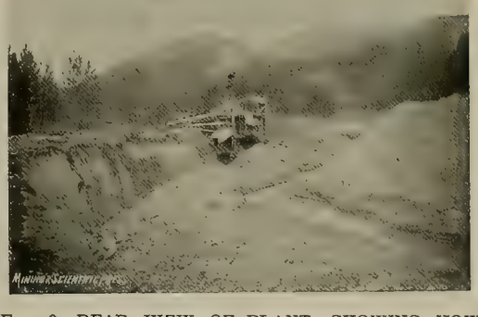

FIG. 3.—REAR VIEW OF PLANT, SHOWING HOW ALL MATERIAL IS DISPOSED OF.

Plants to work such deposits should be designed to strip and dispose of the barren material with the greatest economy at the side of the excavation, washing only the lower stratum of gold-bearing gravel. This feature has not had proper consideration heretofore, as all plants have been constructed on lines that all material excavated had to be washed or run through sluices to dispose of same. This has proved to be a great error and a barrier in the way of progress toward obtaining better results. The outcome of the many attempts to work drained auriferous detritus by mechanical means in the past has proved an inviting field for criticism, which many have taken the fullest advantage of without offering in return an idea or suggestion of value. In view of this, it may be considered rash for a writer to attempt to lay down definite lines and claim they can be safely followed, even in the light of past research. The results of long and dearly bought experience gained in these experiments would indicate that a plant to operate successfully in such deposits and meet the great variations in their topography and conditions should embody the following principles: First—It should be compact and completely self-contained, not comprised of several parts connected together on one or more tracks, and should be capable of propelling itself readily in either direction. Second—It should be constructed without jack arms, spuds, or side supports of any kind. Third—It should be capable of stripping any superimposed burden of barren alluvium and disposing of same economically without washing it. Fourth—The digging or excavating machinery should be of a type which experience has demonstrated to be the simplest, strongest and most effective. Fifth—The excavated material should be elevated to a sufficient height before being washed, so that all "tailings" can be disposed of by gravity alone. Sixth—A method of disintegrating and washing the "pay" gravel and saving the gold should be adopted whereby long sluices can be dispensed with.

A plant was erected on these lines in Washington gulch, Deer Lodge Co., Mont., by W. M. Johnston & Co. of Chicago early last spring, of which the general plan, the washing, and various other devices

used were originated by the writer, and is the outcome of years of evolutionary experiments. It has worked now steadily for more than seven months and the results have been satisfactory in every way, and being the first plant of the kind, strength rather than harmonious lines was considered in its erection.

It is simple in construction, does not get out of working order, and has made a better record than any similar plant ever placed in a drained deposit of auriferous gravel. The plant is termed a traction dredge and is carried on four bogie trucks, which move on double narrow-gauge tracks resting on bedrock. The frame is 30 feet long, 18 feet wide and 22 feet high. The boom is 40 feet long and carries a dipper or shovel of 1¼ cubic yards capacity and handles from 50 to 80 cubic yards per hour. On the main floor of the plant is located 150 H. P. steam boiler and a set of dredging engines of similar capacity, which furnish all the motive power used for excavating the material, handling the car, operating the washer and screen and propelling the plant forward. On the floor above the boiler and engine is located a revolving cylindrical washer and screen; below the screen and extending back and outward are located the sluice boxes, the rear part of which is supported by steel cables and turn buckles, so that any desired grade can be obtained. The car runs on an incline extending from the top of the plant to the solid bank at the side, resting there on a shoe, or on rollers.

Fig. 1 (see opposite page) shows the plant working in a deposit of compact clay and very heavy gravel, 16 to 17 feet deep. The dipper is swung to the left, having just dumped its load of "pay" gravel into the car resting on the foot of the incline.

Fig. 2 shows boom swung to the right and the dipper wasting the barren material on top of the washed debris in the first cut excavated.

Fig. 3 is the rear view of the plant when working on perfectly level bedrock, showing all debris and tailings left where deposited by gravity alone, nothing but water passing down the cut.

In operation the dipper is filled alternately from the upper stratum of barren gravel and the substratum of "pay" gravel, delivering the first to the "dump" on the right and the latter to the car, which is then drawn up the incline and dumps its load of gold-bearing material into a hopper out on top of the plant; from there it passes automatically to the washer, situated immediately below, where complete disintegration and washing is effected. All rocks and coarse gravel passes from the lower end of the screen, at the rear of the plant; the finer gravel, sand, water, etc., passing through the perforations into the sluice boxes, where 97 to 98% of the gold is recovered. Near the tail of the sluice is a sand trap and valve, which separates the solids from the water, dropping them underneath, forming a dam which causes the water to flow away from the plant, regardless of how flat the ground may be. In fact, the plant works equally as well on an up grade, a level or on a down grade.

It excavates a cut 45 feet wide and 7 feet long before moving forward; requires but a few minutes to move up and begin working again, as there are no jack arms or separated sections of the plant to cause delay in moving. The plant can be readily turned to either side to follow a narrow "pay streak" or gulch, as shown in Fig. 3. Water for washing and sluicing is brought from an elevated ditch parallel to the plant by pipe and hose, and is conveyed to perforated pipes in the washer and to the hopper. This plant requires eight to nine men to operate it, and less than one and one-half cords of fir wood is used for fuel each ten hours. The cost per cubic yard in operating will depend on the local cost of labor and fuel and the capacity of the plant, as a plant of large capacity requires no greater number of men to operate it than a smaller one. The average grade of the property worked in Washington gulch is about 19 inches to 100 feet apart, and the supply of water is very small, having been for the greater part of the season between 20 and 25 miners' inches. The capacity of the plant has been limited to the quantity of water available, and the results attained in washing and sluicing the gravel have proved very interesting, probably more so than that of any previous work done in the same line. About five-eighths of the material excavated is not washed. The other three-eighths—frequently amounting to 300 cubic yards of "in place" material—has been thoroughly washed and sluiced in ten hours with this quantity of water by the method adopted for accomplishing same. However well the general plans of a plant may be designed for the purpose intended, if the mechanism is weak or deficient expensive delays are certain to occur. This plant has worked steadily for more than six months, with the exception of being idle but two days, owing to breakage, and the total cost of replacing the broken parts was less than $25—a record equaled by few machines employed in heavy excavating work. To summarize: This plant will work successfully in the most level deposits; will strip and dispose of barren superincumbent material in the most economical manner without washing it; will wash thoroughly more gravel with a given quantity of water than can be done by any other method; all tailings are disposed of by gravity alone and remain on the property worked. This is the first plant constructed on this plan. Other plants are now being erected with modifications and changes to meet the different conditions of the deposits to be worked. There is ample elasticity to the method and general plan, so that plants can be designed of any desired capacity, and to meet successfully any conditions found in auriferous alluvium deposits, except they are of unusual depth or where located under water. The field for mechanical placer mining is a broad one, and will prove very profitable, with little chance of loss, where entered upon and conducted judiciously; but a plant should not be purchased unless a similar one can be shown to have worked successfully, and only then on the broadest guarantee from thoroughly responsible parties that it will meet all the conditions required of it, as until recently the manufacturers of machinery have had a monopoly of the profits arising from expenditures in their line.

Former experience is not necessary for the successful management of such a plant after being erected and properly placed at work. But to insure success, however, in mechanical placer mining it is very important that the detailed conditions of the deposits to be worked should be fully known and the best methods of handling, washing and sluicing the gravel be adopted and put into practice by those having thorough experience in that line, as only in this way can efficiency and economy in working be obtained, which are so essential to success.

WM. M. JOHNSTON.

Washington Gulch, Mont., Dec. 15th, '97.

Siberian Mining Fields.

The following is extracted from a letter recently received from Ross B. Hoffmann, who is assisting his father, Chas. F. Hoffmann, in exploring portions of the mining field of Siberia. They left here about a year ago under engagement for three years as mining engineers for a Russian branch of the Exploration Company of London. Mr. Hoffmann says:

"We first visited the placers at the headwaters of the Selemdja river, on the branches Kharga and Little Nairgen, where we spent three months making detailed examinations.

"The whole of that country is covered with a drift of loose angular fragments of rock—not only the valleys, but the highest peaks, 1000 feet or more above. This drift is covered with a thick mat of moss and forests of small birch, larch and pine. During the winter everything is frozen solid and covered with snow, but in the spring and summer the entire surface, valleys and hills as well, is a marsh. The country rock can only be seen in places along the banks of the rivers and in the bottoms of the shafts and worked-out ground. This is mainly mica schist, with occasional masses of diorite and some quartzite. The drift is of the same materials and in places contains considerable quartz.

"The placer claims are located in the valleys and ravines, which form rather broad, flat bottoms—quite different from the V-shaped canyons of California. There are many remaining accumulations from lateral and terminal moraines to be seen.

"Sections across these valley placers show as much as 700 feet width of flat bedrock (with slight grade down stream). Upon this rests a characteristic bluish colored deposit of mica schist fragments, mixed with sand and clay, entirely unstratified and unwashed; average depth about 4½ feet. This contains most of the gold, the richest streak sometimes being near to the top of the deposit, and not on the bedrock. This streak is supposed to be a concentration from above.

"On top of this is a loose deposit of gravel showing stratification and containing traces of gold. This gravel, if it may be called such, is not well rounded, like our California gravels, and was probably derived from the lateral moraines and drift above. Finally, the whole is capped by an accumulation of vegetable matter, forming a peat or turf, covered with moss, etc.; depth, from 1 to 5 feet

"In one of the claims the bedrock is a soft mica schist, with many seams of quartz, and the gold is both in the clay deposit and the upper foot or so of the bedrock.

"The present streams seldom cut through the thick peat capping. They contain well-washed gravel, including pebbles of granite, porphyry, etc., indicating that they are cutting at points near to their heads.

"Our next trip was to the headwaters of the Amgoun river, about 250 miles east of the Selemdja placers. Here the formation is about the same, being still in the region of glacial drift, but nearer to its edge—hills not covered so deeply with drift, and evidences of old moraines disappearing; country rock and clay schist; upon this, 1 to 8 feet depth, unstratified mass of clay schist and quartz fragments in clay and sand; then varying depth loose deposit, partly washed and stratified of finely broken up clay schist; then 6 inches to 1 foot depth layer of shale; then 1 to 2½ feet depth strata of clay and sand; finally, capped by turf or peat 7 or 8 feet thick. The gold in some of the claims is evenly distributed over the area, in others the pay is in the unstratified deposit above the bedrock. The gold is both fine and coarse, and is not washed—no polished surfaces, only some of the edges slightly rounded. The fineness is from 845 to 890.

"Regarding the drift above referred to, there is no available information concerning its extent. We were near its edge at the Amgoun mines, passed out of it on our trip down the Selemdja, saw no trace of it on the foothills of the lower Boureia, and found it again covering one of the islands of the Japan sea, not many miles from Vladivostock. Here a portion of the deposit was drifted, with little success, however. There are many fine seams of quartz in the country rock, some showing by test traces and high values in gold. This condition probably exists under the drift in many places throughout the country, and may be the source of placer gold. The value of the gravels has been ascertained by test in many of the claims. The areas prospected ranged in length from one-quarter to three and one-half miles, in width from 160 to 385 feet, and in depth of pay deposit from 3 to 4½ feet. The average values obtained were from $1.37 to $4.28 per ton.

"The expense of working varies greatly, according to locality and the amount of overlying barren deposit to be removed—ranging from about $2.80 to $4.50 per cubic yard (calculate about two tons to the cubic yard in place)."

The letter adds: "If you go north, take for summer outfit precisely what you would use in California, with the addition of rubber boots and rubber raincoat. For the winter, assume that underclothing gives no warmth, and depend upon fur coats, caps, boots, etc. Felt boots are the most comfortable, but don't be afraid of having them several sizes too large. At the mines it is handy to have a sheepskin coat, heavy as possible, with the wool inside, reaching a little below the knee, and long sleeves that you can draw your hands up into; woolen scarf for the throat."

Hydraulic Mining.*

NUMBER VII.—CONCLUDED.

The Undercurrent.—This is a large, shallow kind of sluice, from 20 to 50 feet wide and 40 to 50 feet long, with sides 16 inches high, set on a heavy grade at the side of and a little below the main sluice, the design of it being to relieve the latter of the finer material and permit of its handling the remainder more effectually. This structure is located at a point where the grade is too spare for a drop in the main sluice, across which there is here set an iron grating. Through this grating the finer material drops into a box paved with blocks and set at right angles to the main line of sluice; the coarser stuff which passes over the grating being picked up by the sluices set on a lower level, the box meantime discharging its contents through a chute into the undercurrent. This chute, which is paved with cobbles and set with dividers of wood whereby the flow is distributed evenly over the undercurrent, has a 2 to 3 per cent grade and narrows toward its lower end.

The undercurrent, the bottom of which is made of 1½-inch plank, tongued and grooved, is set on an 8 to 10 per cent grade. It is paved with cobbles or small blocks. The gravel escaping from the undercurrent is caught in a side sluice and returned to the main line.

Formerly a sort of subsidiary undercurrent, set beside and below the principal structure, was in use, but they have latterly come to be discarded.

Miscellaneous Items.—In size, hydraulic claims are apt to cover a large area. Longitudinally, they extend from half a mile to four or five miles, running with the course, or supposed course, of the Pliocene or other channel on which they are located. As these channels are sometimes very tortuous, these claims require to be of considerable width in order to cover all their bends and angles. The titles of all the large and many of the smaller companies consist of United States patents. The right to carry their ditches over the public land is secured to the miners by law.

The value of the gravel piped off in hydraulic washing is measured by either by the cubic yard, by the number of inches of water used or by the yield per acre, the latter method of measurement being adopted where the banks are shallow and therefore of large area. A cubic yard of gravel in place varies in weight from one and one-half to one and three-fourths tons, the weight when broken down being somewhat less.

* Begun in issue of Dec. 18th, '97.

R. N. PEARY, the Arctic explorer, in reply to a letter in regard to the moon at the extreme north, says: "The length of the lunar month in the Arctic regions is the same as here, but, as a result of the higher latitude, the moon is above the horizon continuously for several days at a time of full moon. In the latitude of my headquarters on the northern shore of Whale sound, in the latitude of 77 degrees, 40 minutes north, each full moon remained above the horizon for eight or ten days. The length of the winter in this latitude is from the 26th of October until the 14th of February, and there are consequently three winter moons."

Date of Discovery of Gold in California.

To the Editor:—In the Golden Jubilee edition of the Mining and Scientific Press (Jan. 29th), page 111, appears an article entitled "The Correct Date of Marshall's Discovery." We have read it carefully, and we gave especial attention to the statement made that Marshall, Sutter and the Weimers agreed that the 19th day of January, 1848, was the day of discovery. For many years this date was accepted as correct and beyond dispute, simply because unquestioned. Marshall kept no diary or memorandum to assist him in remembering the correct date, and several years had passed by before he was asked to name the date.

It was the ground sluicing used to deepen the tail race that exposed the gold, and none of the men at the mill had ever seen river gold, or had any knowledge of placer deposits. Marshall's companions did not stay long in California; when they had dug a few hundred dollars' worth of gold they went to Utah, where they separated and settled down for life. Marshall gave a clew to the day when he found gold by saying that, although he forgot what day it was, he went to Sutter's Fort four days afterward and showed Sutter what gold they had secured. Sutter's journal records Marshall's arrival from the mountains "on important business" on the 28th of January, 1848. Sutter's journal is now in the possession of the Society of California Pioneers. General Bidwell and William F. Swasey at different times were employed by Sutter to write in this journal, and have subscribed to its authenticity. At the time when Marshall found the gold Sutter made the entries in the journal. John S. Hittell made the accidental discovery that Bigler and Smith kept diaries while working at the sawmill. Mr. Hittell had in September, 1885, delivered the annual address before the Society of California Pioneers, and referred to the 19th day of January, 1848, as the date when Marshall found gold. Hittell had learned that several survivors of Marshall's party at the sawmill were in Utah, and he sent a copy of his address to Bigler, requesting him to correct any errors he might notice, and inform him. Bigler replied that the date did not agree with his diary. Later Mr. Hittell corresponded with Azariah Smith, whose diary corroborated Bigler's statement. Since then another of Marshall's party, James S. Brown, adds his testimony to that of the others, that the 24th of January was the date of discovery.

The supposition that Marshall kept secret the finding of the gold for some days, is not warranted by the evidence of his companions. The first flakes or scales, (thin, cucumber-seed-shape), gave no hint of rich deposits of placer gold to these men, who had never mined for gold in any diggings, wet or dry; they were not even sure that the metal was gold. The survivors of Marshall's party in Utah all agree that the first gold found was of small value. The second night's sluicing of the mill race yielded more of this worn river gold, and the total amount collected in three days was three or four ounces.

The place where the first gold was found at Sutter's mill was not rich as compared with many places above and below, nor did any of Marshall's party find any rich placers or secure more than moderate amounts of gold for their early occupancy of the country. Captain Sutter made an application for a grant of the "gold mines" located at the sawmill, but was unsuccessful in securing the grant. The employes agreed to respect Sutter's right to hold it for his sole use, but the discovery of other and richer diggings diverted the attention of the gold hunters, who soon had prospected the rivers and gulches for a hundred miles. The uncertainty and confusion concerning the date of Marshall's discovery of gold resulted, first, from the fact that Marshall did not keep a diary, and, secondly, too much time had elapsed before he was asked to remember it. I saw both Sutter and Marshall in July, 1849, and had conversations with both of them. I must confess that it never occurred to me to ask either of them on what day Marshall found the first gold. Weimer and his wife were well known people in Sutter's Fort, where I lived in 1849, and also in Coloma, where I also spent some time in the same year. Their statements regarding the first find being a gold nugget, and its being boiled in a kettle of soap, etc., to determine its value, was not heard of by me at Sutter's Fort or Coloma in 1849.

The excitement created by the rush of all classes of people to "the diggings," the disorder resulting from the interference with every kind of business established by Sutter on his ranch property all contributed to cause confusion. At any time the correct date of discovery of gold at the sawmill could have been established by coupling Marshall's statement, that four days afterward he carried the gold to Sutter's Fort, with an examination of Sutter's journal. This was sufficient proof of the exact date without considering the proof obtained later from Bigler and Smith. But when the combined proof of these records of Sutter, Bigler and Smith corroborate Marshall's statement as to the number of days which intervened before Sutter's journal could be used to furnish satisfactory evidence of *recorded* events, then the chain of evidence becomes too strong to be broken.

To perpetuate an error under these circumstances would be contrary to the purpose of the Society of California Pioneers, whose constitution provides that one of its objects is "to collect and preserve information connected with the early settlement and subsequent history of the country." Every committee that has been appointed by other Societies of California Pioneers to investigate and report on this matter of Marshall's discovery of gold has been permitted to examine the records of the Society in this city, and every committee, after an examination, has unanimously reported that the 24th day of January, 1848, was the correct date. There is absolutely no escape from this conviction. Marshall did not want to deceive; he simply failed to remember when asked eight years after the event. Weimer and wife made no record of the finding of gold at the time when it was found. Bigler and Smith were never asked, and their diaries remained obscure and unquoted until John S. Hittell's statement that on January 19th Marshall discovered gold caused a reopening of the whole question.

Edw. E. Chever.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER III.

By Geo. F. Becker.

The Main Reef series comprises several beds of conglomerate at no great distance from one another. The number of these auriferous strata is not constant, and they receive different names in different parts of the district. The beds most often heard of are South Reef, the Main Reef Leader, and the Main Reef. The last named is the widest, usually several feet, and sometimes as much as 12. As a rule, gold is not uniformly distributed through it, and it is not very rich. In most mines only a part of this bed is extracted, and in some it is left standing. The Main Reef Leader is a thin bed lying above the Main Reef at a distance of a few feet or a few inches. It is almost invariably rich. It averages about 15 inches in thickness. The South Reef is commonly separated from the Main Reef Leader by 30 to 100 feet of quartzite. This reef is also thin and commonly very rich. In some parts of the district there are half a dozen valuable reefs, and even more. Whether any one bed could actually be followed by a drift continuously for twenty or thirty miles is very doubtful. It appears to me rather that the beds of conglomerate form a group of very flat lenticular masses, any one dying out in strike, but usually being replaced in the floor or roof by an equivalent bed. In a number of cases one of the reefs is "split" by sandstone or quartzite, and they are known to die out locally. It has repeatedly happened in crosscutting that profitable banket has been unexpectedly encountered, and that such strata were only locally developed. But, although the persistency of the reef is apparently exaggerated on the Rand, there is no doubt that the beds are much more persistent than such beds generally are, and that single strata can be followed continuously for several miles. So long as gold-bearing pudding stones occur, it is of small consequence whether they are the same as, or equivalent to, the banket in the type localities. All the reefs of the Main Reef series carry gold, and portions at least of each seem to be workable.

As has been indicated above, auriferous banket occurs in other districts besides that of the Witwatersrand. It is one of the great problems of economical geology in the Transvaal to trace the Lower Cape, with its bankets, to the eastward and the westward. This task is a difficult one, for various reasons. The Lower Cape was much disturbed and faulted before the Upper Cape was deposited; the larger part of the surface is occupied by Upper Cape and Karoo beds, concealing the Lower Cape; the Karoo is substantially undisturbed; finally, the country is a peneplain, and is rarely dissected to such an extent as to expose the rocks. Much more than nine-tenths of the country is so level that one can drive about regardless of roads, as on the Laramie plains, and this area is covered with grass.

The Heidelberg district is so closely associated with the Witwatersrand proper that the two are regarded industrially as one. To the southwestward the Klerksdorp and the Pochefstroom districts carry auriferous banket, and observers seem agreed that the Lower Cape is represented in these localities. A wide belt of Upper Cape and a granitic intrusion separate the Witwatersrand from Pochefstroom. In 1895 these western districts produced over 90,000 ounces of gold, worth $1,500,000. To the westward of the Heidelberg district the country is a coal-bearing one, and the underlying bankets have been discovered only at certain points; but in Swaziland and Zululand auriferous banket certainly occurs, and gentlemen very familiar with the Johannesburg deposits assure me that all the essential peculiarities of the Lower Cape are there reproduced. At a point called Denny-Dalton, in Zululand, accessible from the railway station of Dundee in Natal, some work has been done on these deposits. The trouble with the Zululand banket is said to be that it runs only four or five pennyweights, so that under present conditions there is no profit in it. It need not be said that richer patches are very likely to occur in a $4 reef.

Marine Origin of Banket.—The strata of the Lower Cape seem to be evidently marine, and they have usually been so considered, but Mr. Henry Lewis suggests that they are lacustrine, and Mr. Schmitz-Dumont is reported to have pronounced the banket fluvial. Geologists are, of course, entirely familiar with the characteristics of lake and river beds as distinguished from marine deposits, but it seems desirable that this information should be more widely spread among laymen interested in the Witwatersrand, and this is my excuse for dwelling somewhat on the subject.

Marine gravels are distinguishable from river gravels even in very limited exposures. The average character of the pebbles is quite different in the two cases, because of the difference in the agencies by which they are shaped. In rapid streams rock fragments are turned over and over, and are reduced to their final shape by great numbers of small bruises which are almost uniformly distributed over the surface. The result is to produce a symmetrical ellipsoidal pebble. Along a sea beach, on the other hand, the waves, when not too violent, drag the pebbles to and fro without turning them over, this process often continuing for a long time with no interruption. The pebbles are thus ground down more on one side than on the other. Hence, as may be seen on almost any beach, there is in marine gravels a considerable proportion of muffin-shaped pebbles, much flatter on one side than on the opposite one.

The pebbles in river deposits also differ from those in marine deposits in their arrangement. In streams the thinner pebbles are tilted downstream and overlap one another like roofing slates. This can be verified in any rapid brook, or even in the runlets of a recent shower. It is also easy to see that this must be the result, for if one were to drop a disk into a rapid stream it would oppose its broad side to the current as it sank, in accordance with well-known mechanical principles, and then, reaching the bottom, it would strike upon its edge, so that the running water would tilt it over downstream.

In ancient gravels which have been disturbed since their deposition, the former direction of the current can be inferred from the overlap, or the "shingling," or imbrication of the pebbles. Confusing irregularities occur only when some strong eddy has locally produced a backward flow. Beach gravels are also imbricated, but only for a few feet in one direction; then the direction changes. The process may be watched on modern beaches, where each wave generates a local current, the effects of which are partially or wholly obliterated by the next. This capricious imbrication is characteristic of beaches.

In the banket of the Rand the pebbles are to a very large extent unsymmetrical, showing one flattest side. This is best seen near the croppings; for example, in the upper levels of the Simmer & Jack, where many of the pebbles have been loosened by the oxidation of the encrusting pyrite. The primitive asymmetry is easily distinguished from subsequent dynamic molding. The arrangement of the pebbles on the Rand is, furthermore, not one of regular shingling, but of capricious imbrication, and this is exhibited in almost any drive or stope.

Streams which have only pebbles in their beds must be rapid, and rapid streams cut into the rock over which they flow. Hence river gravels occur in channels and the gravel lies unconformably on the incised rock. The stratification of stream gravels is always very irregular and is distinguished as "stream bedding" or "cross bedding." Marine beds are almost always found in series, the members of which are regularly stratified and are conformable with one another. As a rule, an offshore area receiving sediments sinks under the weight, making room for successive nearly horizontal beds. Thus, in marine gravels there are no confining channels, and in most cases the conglomerates are conformable with sandstone or shale strata. There are local developments of stream or current bedding even in marine beds, but these are subordinate to the regular stratification in beach deposits, while regular, persistent stratification is absent in river gravels.

On the Rand the Main Reef series is underlain by a series many thousand feet in thickness, and the reef appears to me thoroughly conformable with this immense mass of rocks. The stratification is so perfect that a single pebbly stratum only a few inches in thickness can be traced for many thousand feet, and perhaps for miles, along the strike. No such phenomenon was ever seen in rivers. Neither is there any trace of a river channel. The backs opposite the Robinson Deep must measure over a mile, and there is no trace of a channel wall; indeed, were there a channel it must contain the whole Lower Cape series, which cannot be less than four miles in thickness, measured in a direction perpendicular to the stratification.

Geology of the Yukon.*

NUMBER II.

Parallel with the axis of the geanticline, the chief drainage was carried, and along this line of drainage, which has migrated somewhat down the general dip to the northeast, the Yukon river now flows. By the erosion of this and other streams the present hills, mountains and valleys began to be carved out. Since the period of this revolution the interior of Alaska has probably never been long beneath the waters of the ocean, and therefore the only subsequent deposits are scattered and are of fresh-water origin; although nearer the shore marine deposits are found, showing that during the Miocene time the land area was smaller than at present.

In later geological times, however, the land has been subjected to repeated oscillations which have involved great changes of elevation, but have been without any great amount of attendant folding. Thus, after atmospheric agencies subsequent to the post-Kenai revolution had fashioned the topography after the same general pattern as that at present existing, the elevation caused the acceleration of the streams and the great canyon-like valleys to be cut. These are still prominent features in the topography. During this period also, which was probably mainly in the Pliocene, eruptions of olivine basalt took place from separate vents at various localities.

Subsequent to the eruption of the Canon lake valleys, the total land mass sank beneath the sea, as is shown by terraces, which represent probable shore lines. The scattered gravels found on mountains and in valleys all over the country seem to be one of the effects of marine action at this period; other than these, however, no marine deposits have been found, and the submergence may have been more or less closely contemporaneous with the maximum extension of the great cordilleran glacier, and this may explain the absence of glaciation and also of decayed rock over so large a portion of Alaska. The cordilleran glacier soon retreated, however, and the land began to rise. On the retreat of the sea the country, being still low, the valleys of the old streams were in part occupied by numerous lakes, the water accumulating in consequence of the sluggish drainage, and baisins were formed in consequence of local depression or irregularities of elevation. In these lakes mud or silt rapidly accumulated. With increasing elevation some of the lakes became drained and others were reduced in extent. The streams became more rapid and the valleys began to be excavated again. This is the condition of things at present, and it is probable that the elevation is still going on in a general way.

Auriferous quartz veins were formed in the older rocks at different intervals and their formation was accompanied in a general way by the development of schistosity, so that the veins may be divided into an older sheared and a younger unsheared set. These veins are found chiefly in the schistose sedimentaries, the Birch creek and the Forty Mile series. They are occasionally found in the fundamental granite, and the younger set is sometimes found in the igneous and pyroclistic rocks of the Rampart series. In many places it has been noticed that the younger set of quartz veins, which, on account of their unaltered condition, can be more easily studied than the older set, grade into acid dike rocks, such as aplite. From these and other considerations, a theory of the formation of the auriferous veins has been formulated, namely, that they represent the final stage of a gradual process of rock consolidation, the rocks representing the other stages being found in the same districts. The gold is supposed to be a nearly universal constituent of rocks, and to have been a part of the general magma; and its abundance in some quartz veins is supposed to be due chiefly to the free circulation attending deposition, and perhaps broadly to some special adaptation which gold may possess for solution in siliceous and alkaline fluids, which are conceived to be the final residue of rock solution.

In many places the rocks have been sheared, especially along certain defect portions, and thus shear zones are produced. In some of the formations, notably the Rampart series, there has been no regional schistosity, and therefore these local shear zones traverse an otherwise nearly massive rock. The zones have naturally been selected as channels by circulating waters, and along them a concentration of metallic minerals has often been affected by the deposition in crevices and interstices of materials old in solution. These concentrations or impregnations may in some cases contain gold and silver along with other metals.

The rocks of the Rampart series have been exposed to atmospheric erosion since the time of the formation of the Mission creek series, and probably before, as shown by the conglomerates. This series, however, and the older rocks were first exposed to active erosion subsequent to the post-Kenai revolution. At this period the wearing away of the Yukon geanticline exposed the old rocks in the general broad belt which extends in the northwest and southeast direction for at least 1000 miles. Subsequent erosion has operated only to broaden this zone, which at present constitutes the gold belt of the Yukon district of Alaska and the Northwest Territory. Ever since the beginning of the period of active erosion, the gold-bearing quartz veins and other metallic accumulations have been broken up and carried away by the waters with other rock detritus, and from this heterogeneous mass, the gold being the heaviest, has always had a tendency to concentrate mechanically at the bottom of any deposit. Thus at the present day it is found in the bottoms of the gulches and on the bars of rivers. The older accumulations of the detritus also contain concentrated gold, and these probably furnish some supplies to the more recent accumulations.

The gold of the Yukon district is chiefly derived from quartz veins, which are found most abundantly in the schists of the Forty-Mile and Birch creek series, although not infrequently in the igneous and pyroclastic rocks of the Rampart series. It is also derived—although to a far less extent—from impregnated shear zones, which occur especially in the Rampart series. Of the quartz veins, one set is sheared and one unsheared. The first is difficult to follow, for the veins are broken and non-persistent. The veins of the second set are often persistent and wide, and in some cases may be mined profitably. Impregnations along shear zones may also in some cases be sufficiently rich in metallic minerals to form ores under favorable conditions; and the rock in the region of these shear zones is often unfolded so that these ore beds may be expected to be comparatively persistent.

The quartz veins are connected with dikes, chiefly light-colored, crystalline rocks, such as granite and aplite. This should be kept in mind in prospecting, and auriferous veins may be located if in the schistose near the dikes. In some cases, although not so commonly, they may also occur at some distance from a dike.

These gold-bearing rocks form a different belt, extending in a general way from the lower rampart of the Yukon and below to Dease lake and other mining districts in British territory, a distance in a straight line of about 1000 miles. Of this distance, 400 or 500 miles is in American territory. The width of the belt varies chiefly with the minor folding, which has accompanied the greater plications. In this belt in only the gold-bearing veins but the richest placers are found. This is naturally the case, since the gold in these placers is worn out of the solid rocks. It is especially true that the rich gulch gravels are in this belt, and also the most paying bar gravels, although often gold in some cases may be carried somewhat outside of the belt, and may be sufficiently concentrated in favorable situations to pay for washing.

The Birch creek and Forty-Mile and the Klondike districts are all in this belt, and are all in the schistose rocks, and in these rocks new deposits of value may be looked for. Some placer diggings of value may also be found in the rocks of the Rampart series; but, as a rule, higher horizons are probably barren, save in exceptional cases. Conglomerates made up of the detritus from the schistose Birch creek and Forty-Mile rocks should be prospected, however, since they may prove to be fossil placers. Ancient gravels lying above the present stream channels should also be kept in mind, for they may in places contain sufficient gold to be profitably mined.

The question as to whether a certain deposit, either placer or bedrock, contains enough gold or metals to render it profitable for working is one which can be solved by no universal rule. A deposit which, under certain circumstances, is extremely valuable may, under others, be entirely worthless. The circumstances which must be taken into consideration are: Cost of mining, ease of separating the metals from the ores, facility and transportation and numerous others. The question as to whether any deposit of any mining district in general will become profitable can be only partly solved by geology, for the rest depends upon other sciences. Labor in Alaska is worth $1 an hour, or $10 a day, and this gives a fair idea of the average cost of production of placer gold, which is two or three times that in the more accessible countries. In this region, therefore, a placer deposit, in order to repay working, must at present be three or four times as profitable as a deposit in most other places. In bedrock mines the expenses would be proportionately much greater, since more expensive equipments, machinery, etc., must be provided for the production and probable facilities for transportation of the ore for long distances. Under existing conditions, therefore, the probability of bedrock mines sufficiently rich to repay working is not great.

Were these conditions greatly improved, however, paying mines in the bedrock might be found, and could be worked in spite of the severe climatic conditions. The production at present is entirely from placer deposits, which are profitable in the face of the great disadvantages, and, with better conditions, a vast amount of auriferous gravel now useless would become valuable. The mineral resources must remain for an indefinite period comparatively useless, unless some means be taken for speedier and cheaper communication between the gold region and the outside world. As the country itself produces hardly enough food to support life, all provisions are now imported, the usual route being by sea to the mouth of the Yukon, and thence by the river to the mining district—a distance of over 4000 miles. This makes supplies so expensive that, unless better transportation is provided, the country will probably be abandoned as soon as the richest placer workings have been exhausted.

(To be Continued.)

*Condensed from advance sheets of "Geology of the Yukon Gold Dist. of Alaska," by Josiah Edward Spurr, of the U. S. Geo. Survey.

Two Large Idaho Canyons.

At a meeting on December 22, 1897, Waldemar Lindgren, of the United States Geological Survey, read a paper on "The Canyons of the Salmon and Snake Rivers, Idaho." The little known region between Idaho and Oregon, where the Snake river and its mighty tributary, the Salmon, join is one of exceptional interest. In this vicinity lies the eastern margin of the great Columbia lava-fields, the shore line, so to speak, where the molten flows were arrested by the mountain ranges of Idaho. Near Weiser, Snake river leaves the broad open valley occupying such a large part of southern Idaho, turns northward and flows across the great lava masses in a canyon which, Mr. Lindgren personally assures the editor of the MINING AND SCIENTIFIC PRESS, in grandeur is only second to the canyon of the Colorado. It is an abrupt trench cut to a depth of over 5000 feet in the basaltic plateau. The deepest and most impressive part lies in the vicinity of the Seven Devils, a group of peaks rising to elevations exceeding 9000 feet on the eastern side of the river. From the summits of these there is a sharp and continuous slope of 8000 feet down to the level of the river. The exposures along the canyons show from 1000 to 4000 feet of horizontal lavas, covering a series of older slates and greenstones.

The Salmon river canyon, for a long distance above its junction with the Snake, is between 4000 and 5000 feet deep. Except in its lower portion, it is cut in the rocks of the older series. Granitic rocks, forming a large part of the great Idaho granite area, occupy a large space in Idaho adjacent to the Columbia lava. Instead of being of Archean age, as has been hitherto supposed, the granite is probably post-Carboniferous, as shown by the contact metamorphism of the Paleozonic series adjoining on the north.

This series of slates, limestone, schist and greenstones, says Science, present the greatest similarity to the Auriferous slates of the Sierra Nevada. Round Crinoid stems were found in one of the limestone lenses. Excellent exposures are found in the lower Salmon river canyon and along the Snake river. The Columbia lava flows are of Miocene age. They consist nearly exclusively of massive basalt, and are piled up one on another in seemingly endless succession. Slight differences of structure make the individual flows conspicuous, and from a distance the exposures along the canyon side appear like those of a sedimentary series. The lava flows were poured out over an exceedingly uneven surface of deep valleys and precipitous mountain ranges. The latter tower far above the summit of the lava plateau, while the bottom of the former lies below the level of the river. Coupling this evidence with the fact that the sediments in the lower Snake river valley, above Weiser, are of great depth, their bottom probably not being far from sea level, it appears that this whole area has suffered a depression since pre-volcanic times. The great outpouring of the Columbia lava evidently dammed a gap between the two high pre-volcanic ranges, the Blue mountains of Oregon on the west and the Salmon river ranges on the east. This barrier produced a great lake, the Miocene and Pliocene sediments of which now fill the upper Snake river valley. The inland sea overflowed its barrier, established an outlet, and the mighty volume of water has worn a canyon, which eventually drained the lake.

A COLORADO SPRINGS, COLO., man writes that "the cost of producing one dollar, coinage value, in silver from some of our great silver mines of Colorado has been so often given at from 35 to 50 cents that I give the following as the actual cost in most cases and, in other cases, the closely approximated cost of producing one dollar, coinage value, in gold from a number of our great gold mines: Since the 1st of January, the cost of producing one dollar in gold from the Independence mine is 4 cents; the Victor mine for the past two years, 29½ cents; the Portland mine for nine months, including heavy development work and new machinery, 30 cents; the Bogart mine for the month of March, when they first encountered ore, 5 cents; the Isabella mine, for the year 1894, including the expense of labor troubles, doing development work and new machinery, 31½ cents. The cost of producing gold in the Union, Elkton, Moose, American Eagles, Little Johnnie, Tom Boy and a number of other mines of the State will average about with those above given. Gold is produced from our large gold mines at much less cost on the dollar than silver from any silver mine ever opened in Colorado."

The Stamp Milling of Gold Ores in Its Relation to Cyaniding.*

E. H. JOHNSON.

The President, in his inaugural address, comparing the two solvents, cyanide and chlorine, on closely concentrated ores, used the expression: "Given equal preparation of the material for the use of the solvent." The question of "preparation of material" could, I think, be given a wider field of application than merely to closely concentrated ores, and include the consideration of the present methods of preparation of tailings. The recovery of gold from tailings and slimes has assumed a position of sufficient importance at the present day to warrant consideration of their preparation at a stage prior to their collection. Beyond the various methods of collection and classification, the actual preparation of the tailings is outside the domain of the cyanide worker, and I hope I may therefore be forgiven in venturing outside that province to point out one or two details of common milling practice which militate against the successful treatment of tailings and slimes. I feel encouraged to do so since I find on inquiry that differences of opinion exist between experienced millmen themselves on these points.

It is usual, in referring to the degree of fineness to which an ore is crushed, to quote the mesh (in number of holes to the square inch) through which the material has been passed, and to overlook the important part played by the height of discharge, which is regulated by the "chuck block" of the mortar-box screen. Though, doubtless, you are all familiar with this device, it would, perhaps, be as well for me to define it. It may be described as a block of wood, covered on the mortar-box side with an amalgamated plate, fitting in the screen opening of the mortar-box below the screen frame, and varied in height according to the wear of the dies and the individual taste of the mill man. The deleterious influence of the "chuck block" on tailings preparation is in direct ratio to its height, and I find anything from 3 inches to 9 inches recommended by its advocates. Admitting for a moment its utility for the purposes of amalgamation—a much disputed point—surely the ores of the Main Reef series do not vary sufficiently in character to warrant this wide range in its application. The action of a high discharge is to cause the repeated return of ore particles beneath the stamps, although they were probably sufficiently reduced in size to have passed the screen could they have reached it. The screen-mesh, therefore, becomes no guide to a knowledge of the degree of fineness of pulp without acquaintance of the height of discharge. This is further complicated by the length of drop of the stamps and quantity of water fed into the mill, since by these means also facility of discharge can be accelerated or retarded. The result of a high discharge on the pulp is the reduction of a large proportion of the sand particles to a degree of fineness which is unleachable without excessive loss of sands in classification. Another disadvantage is that the pyritic portion, being the most friable, a large percentage of the fine pyrites passes into the tailings, since it is difficult to retain them in spitzlute concentration.

I made a series of sifting tests some time since of tailings produced by a mill crushing with a 900-mesh sieve and a 9-inch "chuck block." I found that 75 to 85 per cent of the tailings produced would pass through an 8100-mesh sieve. The result was the separation of an abnormal amount as slime and a most imperfectly leachable product of the remainder. So impermeable indeed was this material that vats containing 100 tons of sands absorbed thirty tons of solution without allowing any to pass the filter. The only means of draining these vats was by boring holes with a long rod through the sands, and so forming channels—hardly a desirable form of leaching, you will admit. The ideal physical condition of tailings for treatment is perfect accessibility of every particle, with the crushing carried sufficiently far to expose the gold to the solvent, and a minimum reduced beyond that point. The nature of the rock here, where the gold is principally carried in the more friable portion—the matrix of the pebble—renders the use of high discharge still more disadvantageous. The tendency of unevenly crushed material is to form compact masses of mixed tailings and slimes, which not only resist treatment, but become rich by the absorption of gold-bearing solution. These lumps may be noticed forming a fringe round the edge of dumps and round the conical heaps formed during the filling of a leaching vat.

I have touched upon the influence of the "chuck block" only in its relation to the production of tailings. It would be interesting, metallurgically, if one of our representative millmen would explain its action and advantages, or otherwise, from the amalgamation standpoint. With the high stamp duty required of millmen on these fields (something like double the quantity per stamp as is the case anywhere else in the world), any retarding of the discharge of the crushed material beyond the desired mesh of sieve seems to me to be anything but a desideratum.

Another common milling practice is that of taking the heated water from the condenser of the engine for milling purposes. In this connection I would like to draw attention to the well-known report of Mr. Wm. Skey, analyst to the Geographical Survey of New Zealand, on the losses in gold amalgamation occurring in the Thames gold fields. You will pardon me quoting somewhat fully, as his remarks have taken an extended bearing from their applicability to cyaniding as well as amalgamation. He reports:

1. "The numerous samples of bright, clean looking gold, of all degrees of fineness, refused to amalgamate on any of their natural surfaces, though taken directly from the reef and untouched by hand.

2. "That on such surfaces sulphur was always present.

3. "That native gold, or gold in a pure state, readily absorbs sulphur from moist sulphuretted hydrogen or ammonium sulphide, and absorbs it directly when administered in boiling water.

4. "That surfaces so treated refused to amalgamate, though no apparent change could be observed in their aspect.

5. "That gold so affected is rendered amalgamable by roasting in an open fire, unless copper is present to the extent of 7 per cent, or perhaps less, while the same effect is produced by contact with potassium cyanide, chromic or nitric acid, and calcium chloride acidified.

6. "That this absorption is altogether of a chemical nature.

7. "That sulphate of iron in presence of air and water decomposes various metallic sulphides common to auriferous ores in such a manner as to liberate sulphuretted hydrogen."

The point I wish to emphasize is that the absorption of sulphur from sulphuretted hydrogen by native gold occurred *immediately* when administered in boiling water. Ferrous sulphate is present to some extent in all our mine water, and, consequently, in the water used in milling. The conditions necessary for the decomposition of the metallic sulphides and consequent evolution of sulphuretted hydrogen are therefore present. It is fair to assume that the rapidity of this decomposition is in ratio to the temperature of the water, as indicated by Mr. Caldecott in his paper on the "Treatment of Accumulated Slimes," read at the July meeting of this Society. Mr. Skey has pointed out the injurious action upon the free gold, and we have to consider the injurious action of this decomposition in providing us with those oxygen absorbents and cyanicides which impair results in subsequent treatment of tailings and slimes. Nature has been already sufficiently generous with respect to these ferrous compounds without our adding to the supply by a system that is advantageous to no department of gold recovery.

There are two chemical conditions of the ore in which the cyanide treatment progresses satisfactorily: (1st) The condition before any decomposition of the metallic sulphides has taken place; (2d) When complete decomposition has been obtained, or, in other words, when the ore has satisfied its absorbent capacity for oxygen. No better example of this could be given than the experiment made by the President and quoted by him at the August meeting of this Society. It was in reply to a question respecting the effect of partial roasting. He said: "We made a careful series of determinations by partial roasting. We started on top and took our samples right down through the furnace, and the moment the heat commenced to act we got extractions which decreased all the way down until the ore was dead roasted, when the extraction went up." As roasting would only be available in the treatment of rich and heavily sulphuretted material, it behooves us to endeavor to obtain as near as possible the first condition named, and to avoid anything in the preparation of the ore which advances the decomposition of metallic sulphides. The initial stages of decomposition having been set up, the rest becomes cumulative from the further reaction of the products of decomposition, and as each reaction requires a further supply of oxygen, there is a constant withdrawal of available oxygen required for successful treatment.

Having endeavored to deal with these two milling practices from the point of view of their influence on cyanide work, it would be interesting to hear if in amalgamation there are compensating economic advantages to justify their undoubted deleterious influence on cyanide work. It is with no desire to trespass within the province of the mill manager that I have brought forward these few remarks, but, if possible, to draw attention to the double function of the mill in its capacity as an amalgamating machine and its equally important service in the "preparation of material for the use of the solvent."

*Chemical and Metallurgical Society of South Africa.

Origin of Amber.

The main source of the amber supply is the sea coast of the Baltic sea. It is fossil gum, originally the exudation of a species of conifer now extinct. This grew in luxuriant profusion hundreds of thousands of years ago on the marshy coasts of northern Europe, when the climate was much warmer than it is to-day. The natural history of amber is thus explained: The immense forests of amber pine underwent their natural downfall and decay. The resin of the wood accumulated in large quantities in bogs and ponds and in the soil of the forest. Where the coast was slowly sinking, the sea by and by covered the land; and the amber, which had been gradually hardening, was at last deposited at the ocean bottom. But in higher regions the pines continued to flourish, and so amber would still continue to be washed down to the shore and deposited in the later-formed green sand and the still later formed stratum of lignite or brown coal. The gum became fossilized by its long burial underground.

More than 200 specimens of extinct life, animal and vegetable, have been found imbedded in amber specimens, including insects, reptiles, plants, leaves, shells, fruit, etc., which had been caught in the liquid gum and entombed there for all time. Some of these specimens are so curiously beautiful as to be almost priceless, and one English collector has a cabinet of them which is valued at £100,000. One piece embalms a lizard about eight inches long, a little jewelled monster perfect in its form and coloring, which has no like in anything existing now. Indeed, in many instances, science is able solely through this medium to study details of animal life which perished from the earth many hundred thousands of years ago. There are flies preserved with wings poised as if for flight, where the prismatic sheen glowing through the yellow sepulchre is as brilliant as if they were floating alive in the sunshine.

Natural Gas Wells in the United States.

The wells usually are started with an 8-inch hole, which is fitted with wrought iron pipe, through the drift to the bedrock. Through the succeeding strata a 5⅝-inch hole is drilled and fitted with a wrought iron casing down to the solid, impervious stratum located just above the gas-bearing rock, through which the drill is run without any casing into the gas rock. Upon the developments at this point depend the next steps. A mixture of oil and salt water may be encountered with the gas, and many ingenious experiments are adopted to separate them.

The gas is brought to the surface through 2½ or 3-inch wrought iron pipe, at the bottom of which is placed an arrangement of so-called "packers" to make a gas and water-tight joint between the pipe and the solid, impervious rock wall of the drill hole, and if water and oil are found in the gas rock, to keep them from flowing up from the lower end of the pipe. The general style of the many types of packers is the same. A hollow cylinder of rubber, smooth or ribbed on the outside, and as large as can be put in the well, is held above and below by a ship joint. When the tubing rests on the bottom of the well, the weight of its upper part forces the top flange upon the rubber, distending it against the sides of the well, and thus making a gas and water-tight joint.

At the surface end of the tubing three valves are placed and arranged so that the well may be blown out into the air, or shut off from the service main, which is also blown out from time to time. Before confining the gas by closing these valves, the tubing is anchored down by clamps and ties to the top of the 8-inch casing. In spite of every precaution, attempts to control the gas are often followed, where great pressures are encountered, by the lifting of the tubing casing and all from the ground. Instances are recorded of wells remaining uncontrolled for over a year.

The depth of the wells varies greatly in the different fields, the widest variations being in the Ohio and Pennsylvania districts, while in Indiana it is more uniform. The best wells in Indiana are about 1000 feet deep, and, as a rule, tap the Trenton limestone less than 100 feet either way from sea level. In Pennsylvania and Ohio wells are much deeper below sea level. A geological section of Indiana rocks along a line from Delta, Ohio, to Terre Haute, Ind., passes through the most productive region.—Hosea Webster, in Cassier's Magazine for February.

AN improved process in steel casting, applicable to large or small guns, engine cranks, railway wheels, propeller shafts, etc., is described at length in a contemporary. The design of the inventor is to meet or prevent those hidden flaws in steel which so often produce bursting and fracture. The plan is to make the castings in an airtight chamber from which all air is exhausted, the mould or casting being placed in the chamber before the exhaustion of the air. This chamber is surrounded by a series of other chambers, each connected with the central chamber by a pipe controlled by valves, and in these chambers a reserve vacuum is stored, the air from them being exhausted by vacuum pumps. When a casting is ready to be run in, the controlling valves are opened and the residue of air in the casting chamber is instantaneously sucked out into the surrounding chambers at the same moment that the molten steel is poured into the mould. The casting thus takes place in vacuo—that is, the secluded air and gases rush out of the fluid metal and diffuse themselves in the vacuum chambers, and a flawless, homogeneous steel casting is the result.

New Explosives in Mining.

Inventors have been busy lately in an effort to discover a safer and cheaper explosive than gunpowder for the blasting of coal. Some interesting experiments were recently carried out at Southport to determine the relative strength and efficacy of a new explosive. The conditions of the test in each case were the same, ten grammes of the explosive being used. This was placed in steel mortar loaded with a projectile weighing thirty-five pounds. All shots were fired at an angle of 35°, with the following result: Gunpowder threw the projectile 31 yards; kynite, 88½ yards; benedite, as the new powder is called, 155 yards, and dynamite, 161½ yards. Benedite contains no nitro-glycerine, and it was also subjected to severe tests as regards handling. Unlike dynamite and explosives generally, benedite could not be exploded by either a blow from a hammer or direct application of flame. It can only be exploded by means of a detonator. For safety blasting coal in mines a series of trials have shown that when it is exploded in the presence of highly inflammable mixtures of pit gas and coal dust it would not ignite them. It is further claimed for the new explosive that its cost of production is much below that of powerful explosives generally, and it is to be put on the market at a considerably lower price.

In the early days of dynamite the mischievous and often fatal doctrine was thoughtlessly promulgated that, under the influence of fire, that explosive would only burn, and that nothing would cause it to explode except the application of a proper detonator. Notwithstanding the efforts made to cause the public to unlearn this foolish doctrine, it still lingers. The doctrine preached by those who know anything about the matter is that explosives are only comparatively safe at the best, and then only so long as they are treated as absolutely dangerous. There is no reliance whatever to be placed on the theory that dynamite and many of its congeners can be burned without exploding. This has been illustrated over and over again with fatal results. Were the author of a highly flavored story to introduce into his plot the instantaneous death of a newly married couple by an explosion of dynamite in the stove of their sitting-room, the explosion being brought about by the bridegroom's brother baking the dynamite in the oven, the author would probably be accused of going beyond the bounds of probability after the sensational, and yet this combination of circumstances did actually occur in a mining district in England. The ingenuity exercised in devising means for thawing dynamite in the most unsafe way possible is certainly very remarkable. This thawing-out process is the most fruitful cause of accidents with dynamite. The dynamite becomes inert at about 40° F.; and, while this is a very valuable property for transportation purposes, it plainly also has its disadvantages.

On page 82 of the issue of the 22nd ult. appeared an article on the care and management of belting, which originally appeared in the *Scientific Machinist* of Cleveland, O., on Jan. 1st, and to which excellent journal credit (which was inadvertently omitted) should have been given.

Dr. C. G. Baldwin of Claremont, Cal., has organized a stock company with a capital of $250,000 to develop electric power at Mill creek, about twenty miles east of San Bernardino.

Recently Declared Mining Dividends.

Jamison M. Co., Cal., 5 cents per share, $19,500; Feb. 15.

Mammoth M. Co., Utah, 5 cents per share, $2000; Feb 2.

Geyser-Marion Co., Utah, 3 cents per share, $9000; Feb. 1.

Ruth mine, Sandon, B. C., $75,000; Feb. 20.

Whitewater mine, Slocan, B. C., $30,000; Feb. 1; total to date, $154,000.

Swansea M. Co., Utah, 5 cents per share, $5000; Feb. 10.

Coast Industrial Notes.

—During '97 about 26,000,000, gallons of wine were produced in California, at an average price of 9 cents per gallon.

—The graders of the Valley Road are at Bakersfield, Cal. The road will begin to operate there by March 1st.

—H. De Laguna has made an offer to the Los Angeles, Cal., city council to construct and equip a complete water plant for the sum of $1,875,000.

—California expects to produce 160,000 tons of beet sugar this season. One-half of this will be consumed in the State, leaving 75,000 tons, or 6250 carloads, to be shipped East.

—L. Terrazas and associates have been granted a concession for the establishment of one or more packing houses in the republic of Mexico. They must invest $1,000,000 in the plant, and have deposited $10,000 as a guarantee.

—The Sonora, Cal., *Democrat* says that the Stockton and Tuolumne Railroad will positively be built, that it knows one person who has put up $100,000 in cash, taking therefor stock in the Stockton and Tuolumne Railroad, and stands ready to put up a like amount at a few days' notice.

—Orange shipments from southern California are now under full headway. During the season they range from 40 to 120 carloads daily over the Southern Pacific, and at present the line is carrying toward the East ninety carloads every twenty-four hours. Three hundred boxes go to the car, containing each on the average 200 oranges. This would make the present shipments of that fruit over that line 5,400,000 daily.

—The Port Susan Logging Co. has just completed a contract for what is reported to be the largest cargo of spar timbers ever put out of Puget Sound. The cargo consists of 640 spars, running from 50 to 116 feet in length, and varying from 72 inches in diameter at the base to an 18-inch diameter at the top. The spars go to Boston. The logs are squared at the butt end and for one-half of the whole length, making the square of the butt equal to the diameter of the log at the one-half mark.

—A contract for the construction of the railroad tunnel, near Point Richmond, Cal., was awarded this week by the Board of Directors of the San Joaquin Valley Railroad to Foley Bros. & Muir of St. Paul, Minn., conditionally. The reason for the proviso was that no representative of the successful bidders was present to enter into a definite agreement, one of the terms of which is the filing of a bond in $100,000 for the proper execution of the work. The amount of the contract is stated by the railway officials to approximate $350,000. The construction of this tunnel is in effect the starting point of the direct connection of the Valley Railway with San Francisco. It is to permit the passage of trains from Stockton to Point Richmond, on San Francisco bay, through a range of hign hills laying between the tule lands and the promontory. The tunnel proper will be 5700 feet in length.

—Regarding the Nicaragua canal, the Maritime Canal Company, anticipating a favorable report from the Walker commission as to the feasibility of the project and of subsequent favorable action by Congress, has men on the ground prepared to begin the work of construction. Under terms of its concession from the Nicaraguan government, the canal was to have been completed next fall, otherwise the concession would be forfeited unless the company had expended a large sum of money. In fact, it is the contention of the Nicaraguan government that the concession has already been forfeited, but this contention is not accepted by either the company or the administration. The preliminary report which the commission will make will be submitted to Congress with a view to getting favorable action upon the bill. It has been anticipated that the report would be favorable, both as regards the feasibility and cost of the canal. The estimate made by Civil Engineer A. G. Menocal for the company in 1895 for the construction of a canal following the Tola basin line puts the coast of work at $66,466,880, and a second estimate, the canal to follow a low level line, fixed the cost at $68,893,660. The Ludlow commission estimated that a canal built along the low level line would cost $133,472,893. If the Walker commission estimated that the cost will be three-fourths of Mr. Menocal's original estimate $66,466,880, then it fixes the figures at $49,855,160.

Commercial Paragraphs.

The Colorado Iron Works Co. have just shipped two carloads of machinery for the new roasters the Germania Lead Works of Salt Lake City, Utah, are putting in. This shipment will be followed with eight carloads more before the entire amount ordered is shipped. The Bruckner cylinders now being built by the Colorado Iron Works Co. for the above company are 8 feet 6 inches diameter by 37 feet long, and these will be shipped as soon as completed. The number of cylinders being built is five. The Colorado Iron Works Co. have also made shipment of two carloads of machinery to Old Mexico, one carload being concentrating machinery for the San Vincent M. Co., at Ameca, and the other carload constituted settling bowls for the Great National Mexican Smelting Co. at Monterey.

The General Electric Co. has received orders from the British Thomson-Houston Co., Ltd., covering the complete locomotives for the Central London Underground railway. The original contract between the two latter companies included, with the special gearless motors and other electrical equipment, thirty-two locomotives for this important underground system, but these it was supposed would have been built in England. The decision to confide the construction of the locomotive cabs and trucks, as well as the electrical equipment, to the General Electric Co., is dictated by the desire to have the locomotives built complete under the same supervision. The locomotives will each weigh about forty-five tons, and will be equipped with a total of 800 H. P. in motors. The trains to be hauled will be made up of five cars, giving a total load of 150 tons, ten tons heavier than the ordinary Manhattan Elevated train. The schedule speed will be 15 miles an hour. The diameter of the tunnel being 11 feet 6 inches only, motor cars could not be used. The entire electrical equipment will, therefore be placed on locomotives, which will probably resemble in appearance those in use on the Manufacturer's railroad in New Haven, Conn., and on the Hoboken Shore road, Hoboken, N. J. The General Electric Co. is building thirty-eight additional 175 H. P. motors for the Metropolitan West Side electric elevated road.

The No. 8 Gates rock and ore breaker may well claim the distinction of being the largest rock crusher ever made, and it probably marks the highest limit attainable in a practical way. A recent report from one of these machines gives a record that will doubtless stand long at the front. The Pittsburg Limestone Co., Ltd., of New Castle, Pa., reports officially as having in fourteen months crushed 23,174 cars averaging 24 gross tons each. The working day was ten hours. This gives an average hourly product of over 180 tons for fourteen months. Some of the large daily outputs seem almost incredible. On June 21, '97, this machine crushed 4,350,000 pounds of rock, or 2175 tons. This means a freight train of nearly 100 cars.

Books Received.

"*The Proceedings of the Chemical and Metallurgical Society of South Africa*," Volume I, May, 1894-January, 1897, being the best utterances of the leading miners and metallurgists in Johannesburg on the cyanide and other up-to-date gold mining processes. Nearly the entire contents of this book of 350 pages have already appeared in the columns of the Mining and Scientific Press from advance sheets, which is the best evidence of the high opinion this paper has entertained of its value. The book is issued in admirable style by R. W. Hunter of Edinburgh, Scotland.

"*A Manual of Hydraulic Mining for the Use of the Practical Miner*," by T. F. Van Wagenen, second edition, 95 pages, 12mo.; a handy little volume, not pretentious, but of use to practical miners. The author in his introduction says that hydraulic mining is "simply a question of moving gravel or soil from one place to another," which is somewhat superficial in its idea—hydraulic mining being a great deal more than that. Our drift and gravel gold miners in this State will hardly agree with the author where he says, a little further on, speaking of gold in gravel deposits, that "the chemical and mechanical operations required to separate it from its vein substances, with which it was originally associated, have already been performed by nature." The book is sold by D. Van Nostrand & Co., 23 Murray street, New York City. Price $1.

"*Placer Mining; a Hand Book for Klondike and Other Miners and Prospectors*," 146 pages, 8vo., giving routes to the Yukon, practical suggestions as to outfits required, mining regulations of Canada, some pointers as to camping and traveling, with incidental geology as to the origin of gold placers, and some remarks on the origin and development of placer mining, with illustrations drawn from California hydraulic practice. Published by the Colliery Engineer Co., Scranton, Pa. Price $1.

"*A Practical Hand Book for the Working Miner, Prospector and Mine Investor*," by John A. Miller, 228 pages, 8vo., containing considerable general information, but not of the kind of any great practical benefit to the Pacific coast miner. It would be impossible to write a book on the subject that would not be of some value to some one, and doubtless there are many miners who would find this book of considerable value. In general, its fault is that it is not specific. It treats of its topics in a general way and attempts to cover too much. Essays on such questions as "Is Mining More Dangerous to Life, Limb and Health Than Other Trades?" and diatribes on the folly of too much credence in the assertions of mining prospectuses, together with chapters on how a board of directors of a mining company are to run their business, with incidental discussions of mine managers, booms and necessary legislation, are not what the average Pacific coast prospector is looking for. The book is published by Spon & Chamberlain, 12 Cortlandt street, New York. Price $3.

Recent California Mining Incorporations.

Table Mountain M. Co., Fresno; capital stock, $100,000; subscribed, $10,000; C. S. Peirce, F. H. Short, M. Lauer, J. Q. Anderson, C. A. Knepper.

How Duck M. Co., San Francisco; capital stock, $15,000; subscribed, $5500; Hoo Sue, Hoo Lee, Hoo Sam, Hoo Ping, Hoo Wai.

Gold Nugget M. Co., Colfax; capital stock, $10,000; subscribed, $1000; A. G. Bell, G. W. Lewis, R. Gay, E. F. Sailor, W. L. Baker.

The Santa Theresa and San Juan M. Cos., San Francisco; each company has a capital stock of $100,000, of which $81,000 has been subscribed; W. G. Leale, L. H. Turner, R. M. Murray, W. E. Elliot, F. H. Stearns.

Personal.

Chas. D. Lane is in Mexico.

Geo. McAulay is now Supt. Mayflower mine, near Forest Hill, Cal.

D. L. Coles of the Montauk mine, Newcastle, Cal., has gone to New York.

J. S. Muir of Glasgow, Scotland, is examining mining property in Deadwood, S. D.

Dr. N. S. Keith, a pioneer electrician, has returned from a five years' residence in London.

Eugene Del Mar is in San Bernardino, Cal., buying mining property near Holcomb valley for English investors.

Mr. A. P. Brayton, Sr., Pres't Pelton Water Wheel Co., is back from a sojourn in Hawaii, much improved in health.

C. S. Warren of Spokane, Wash., is understood to be slated for the position of manager of the British America corporation.

N. Tregear, who was foreman under the late Capt. Hall, succeeds that gentleman as superintendent of the Le Roi mine, B. C.

F. E. Shepard, formerly consulting engineer for the Denver Engineering Works Co., has succeeded Mr. Croll as superintendent of the works.

D. J. McDonald, recently appointed inspector of metalliferous mines for the province of British Columbia, has entered upon his duties at Rossland.

T. L. Canvin succeeds Stephen Moyle in the superintendency of the Potazuba mine, Sutter Creek, Cal. Mr. M. is the new foreman of the Gwin mine.

Capt. Thos. Mein returned from Mexico this week in company with Wm. Chalmers, of the firm of Fraser & Chalmers, and Col. Perkins, of Goodall, Perkins & Co.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING JANUARY 25, 1898.

597,960.—Miner's Lantern—Harriet J. Delzele, Jackson, Cal.

597,904.—Transporting and Weighing Cane—A. S. Hallidie, S. F.

598,067.—Car Fender—W. B. Heywood, Gualala, Cal.

598,068.—Car Fender—W. B. & W. H. Heywood, Gualala, Cal.

597,991.—Swing—G. M. Lease, Salem, Or.

597,734.—Hay Loading Net—C. McConnell, McDermitt, Nev.

598,004.—Pitman for Mowers—J. S. Ord, Aptos, Cal.

597,832.—Wave Power—J. M. Palmer, Fort Grant, A. T.

597,833.—Wave Power—J. M. Palmer, Fort Grant, A. T.

597,788.—Photo Carrier—M. V. Shaff, Los Angeles, Cal.

598,025.—Gas Engine—S. S. Simrak, S. F.

597,920.—Refining Oils—E. A. Starke, San Rafael, Cal.

Note.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

Device for Transporting and Weighing Cane.—A. S. Hallidie, San Francisco, Cal. No. 597,904. Dated January 25, 1898. This invention relates to a method of transportation by means of elevated wire ropes elevated above the ground, moving on sheaves or pulleys, and usually called ropeways, and automatically depositing and weighing the discharged product. This invention is especially designed for the rapid and economical transportation of sugar cane and other products grown from fields where they are gathered to a distant point where it may be desired to collect them. This is accomplished by means of an endless traveling rope suspended above and across the field occupied by the growing crop, a carrier suspended to clips or saddles upon said rope, one or more hangers depending from the clips, each having an eye at the upper end to connect it with the clip, and a pawl and socket connection at the lower end for the suspension of the carrier. The carrier has jointed arms connecting to the hangers, a counterbalance lever, a latch or keeper to hold the cradle sections in position and diagonal braces to prevent longitudinal swinging of the hangers. At the point of deposit is a tripping piece which acts to automatically disengage the latches and allow the cradles to tilt and discharge their contents upon the weighing platform. This weighing platform carries upon it a receiving surface having an upwardly projecting guard upon one edge, this surface or platform normally standing in a horizontal position, so that the contents of the carrier are discharged upon the platform, where it remains long enough to be weighed, after which the platform is tilted to deliver its contents to a chute or other means for conveying it to the feeding belt of the sugar mill or to any point where it is to be deposited.

It is worthy the attention of those engaged in the manufacture of cane sugar.

TEN WEEKS FOR TEN CENTS!

Strange as it may seem, that big family paper, the *Illustrated Weekly Sentinel*, of Denver, Colorado, (founded 1890) will be sent ten weeks on trial for 10c.; clubs of six, 50c.; 12 for $1. Special offer solely to introduce the paper. Gold rings set with Rocky mountain gems are given free as premiums. Latest mining news and illustrations of grand scenery each week, also true stories of love and adventure Address as above and mention Press. Write today; postage stamps taken.

Mining Summary.

CALIFORNIA.

Amador.

The Argonaut mine's reservoir at Jackson, for mill power, is completed. It will hold 8,000,000 gallons of water.

Mining operations at Oleta have been suspended for lack of water.

The shaft at the Argonaut mine is now 1710 feet deep. Work in the mine at present is confined to and above the 1200-foot level; ore enough is taken from the upper levels to keep the forty stamps dropping steadily night and day.

The South Eureka plant at Jackson is run by electricity. This is the first plant in Amador county run by electricity.

The new hoist at the Amador gold mine will be operated by a 6-foot water wheel driven by a stream having a fall of over 300 feet.

The Keystone is crushing about 5000 tons of ore a month. The South Spring Hill is about ready to start up. The 80-stamp mill of the Wildman-Mahoney runs steadily. At the Wildman the sinking of a perpendicular three-compartment shaft has been commenced 800 feet east of their old shaft. This shaft is expected to strike the ledge at a depth of 2300 feet. The Balliol 40-stamp mill is running steadily on paying ore. In the Kennedy they are drifting for the ledge on the 2150-foot level. After spending nearly $125,000 on the Alma within the past four years, the promoters have shut down. The Zeila 40-stamp mill is running without interruption. The 30-stamp mill of the Union Con. will start up when there is a sufficient supply of water, as there is plenty of ore blocked out.

A contract for sinking the South Eureka shaft at Jackson 200 feet deeper has been let to Crocker & Wells of Jackson, the price per foot being $14.95. The present depth of the shaft is 1300 feet.

Calaveras.

At Douglas Flat the Lone Star Co. has over 200 carloads gravel in their dumping box. The Ohio Co. have over 1000 carloads of gravel in their dump box. The old Dashaway (now called Holliday) mine is to be reopened.

The Pine Log mine at Copperopolis is giving good returns.

All mining at Murphys has been temporarily suspended owing to cold weather and lack of water.

The Spanish Bar G. M. Co. has incorporated—capital stock, $50,000; J. Hay, H. G. Grauerholz, J. Daisley, J. Klein of San Francisco, W. T. Robinson—to mine on the Mokelumne river, three miles from Mokelumne Hill, a gravel deposit to be worked by hydraulic elevator.

El Dorado.

(Special Correspondence).—At Nashville the old Montezuma is again among the producing mines. C. J. Heald, the owner, has put several men at work and the mill is grinding on $10 ore.

The Gearhart, 20-stamp mill, is idle, awaiting development work.

At the German sinking continues with satisfactory results. After years of idleness and later vicissitudes by various parties endeavoring to reopen the property, the present owners are meeting with success by their systematic work in seeking depth.

The Union, situated between the old Springfield and Church-Union, is proving a surprise in its rich ore. The average yield is $40 per ton. There are twenty stamps in operation. The property is owned by Judge Williams and A. Harpending.

At the Omo mine, owned by F. S. Jones & Co., the 5-stamp mill is running on $10 ore.

The Big Sandy is taking out rich ore near the surface. The greatest depth reached is 330 feet. The company is preparing to sink deeper. The property is owned by Toledo people.

At the Ohio they are drifting on the 300 level. The results of this work will determine future operations of the company on this property.

The Pocahontas is being experted by W. R. Chadbourne of Leadville for the St. Louis owners. I am reliably told that upon his verdict depends whether or not the company will continue operations.

The Griffith, Larkin and Boulder are showing successfully that deep mining is essential to making good mines on the mother lode in this county.

N. Fossatti has begun development on a gravel property of large acreage at Smith's Flat.

On the Cleveland the shaft has reached 264 feet. The ledge is in 8 feet on low-grade ore.

Placerville, Jan. 31st, '98.

(Special Correspondence.)—The Newton Drift mine is ready to start its ten stamps as soon as water is available.

At the Montauk work progresses satisfactorily to the new purchasers, who seem elated over their acquisition. They are considering the immediate addition of twenty stamps.

Placerville, Feb. 1st, '98.

Work is to be resumed in the Lucky Marion mine at Greenwood.

The mill on the old Zentgraff mine, near Rattlesnake Bar, is to moved to the new Zentgraff mine on Sweetwater creek, near Green Valley.

The Esperanza 10-stamp mill at Garden Valley is completed and in running order.

Kern.

A Johannesburg correspondent writes: The King Solomon mine is turning out $1000 ore at a depth of 315 feet, and from the William J. Bryan mine a strike is reported of still richer ore. From the Nancy Hanks (of the Rand) fifty tons will be sent to the reduction works as an experiment.

The Butte M. Co., which has had an option on the Butte mine at Randsburg, has deposited $50,000 in the Bank of Tehachapi, which will go to the original owners as soon as their title is clearly shown. It is stated that they have struck a newly discovered ledge varying in width from 4 to 25 feet and running about $40 to the ton.

Randsburg *Miner*: Arrangements are about completed for the erection of the first stamp mill in Randsburg, to be erected on the Kinyon mine.

The Yellow Aster mine, Randsburg, is producing over seventy-five tons a day of about $30 gold ore.

Madera.

(Special Correspondence).—The incline on the footwall at the Magnet mine, near Central Station, has reached a depth of 50 feet, showing satisfactory. A stratum of ribbon-quartz, occupying a space of 12 to 18 inches next to the clay gouge of the footwall, runs $6 to $8 in free gold and carries 5 per cent of high grade sulphurets.

The owners of the Lily mine, near O'Neal's, will shortly add additional stamps to their mill and will establish a pumping plant on Fine Gold creek.

Gold, Jan. 31st, '98.

Mariposa.

Brown & Turner, representing the Con. M. Co. of San Francisco, were at Bear Valley last week, examining the Los Minos mine.

Nevada.

The You Bet hydraulic mine, which has been idle for ten years, will start up again in two or three weeks and give employment to twenty-five white men.

Nevada City *Transcript*: Chapman Ranch M. Co.'s new 5-stamp mill is run by electricity.

Orange.

The crushing plant at the Dunlap mine, in Silverado canyon, is completed and will commence operations as soon as enough water will rise in the creek for operating power.

Placer.

Mr. Chappellet has word that at the Eureka Drift mine they are making fine progress in the tunnel. The steam drills were started up on Jan. 15, and in the following week 47 feet were driven, putting the tunnel in 105 feet beyond the upraise.

Colfax *Sentinel*: The Lost Emigrant quartz mine, on the North Fork of the American, is sixteen miles south of Soda Springs. The shaft sunk on the ledge is down 74 feet. A test of rock on the surface shows a value of $165.80. Ore from the bottom goes $173 to the ton. Tests of rocks taken at intervals for 2500 feet on the ledge assay from $5 to $160 per ton. A mill will be erected this season.

Auburn *Argus*: Considerable development work has recently been done on the Galena quartz mine, at Black canyon. The main tunnel has been extended on the ledge 410 feet. The ledge has an average width of 4 feet. Development work is being done on the Horsefly quartz mine, which is an extension of the Galena quartz mine in Black canyon. The prospect tunnel is now in 70 feet on the ledge and some fine-looking quartz has been taken out.

Tidings: The Liberty Hill and Polar Star hydraulic mines, the former in Placer Co., the latter in Nevada Co., near Lowell Hill, have completed raising their dam 10 feet, in accordance with a permit granted by the Debris Commissioners. The dam is built in Bear river, opposite Dutch Flat, is 60 feet high, and the mining companies have the privilege of building it 10 feet higher when necessary. This dam was made by hydraulicking the Polar Star mine, running the slickens down to a narrow point in the river and building the dam with the waste dirt thus washed down. The working of these mines is permitted by the Commissioners, and gives employment to forty or fifty men. The Polar Star is superintended by W. Maguire of Lowell Hill. At the Liberty Hill mine they are working on a good channel of gravel. On the day the mine was visited a powder drift 60 feet deep in the side of a mountain, with drifts running from the end of that drift 40 feet each way, was completed. Five hundred kegs of black powder will be placed in this drift and exploded, loosening the ground to facilitate hydraulicking. Two thousand five hundred inches of water, with a 500-foot pressure, is continually pouring out of a 6½-inch nozzle. Seven anti-debris men viewed the dam on Sunday. When asked their opinion, Mr. Phipps said the dam was fairly satisfactory, but its merits will be discussed at the next meeting of the Anti-Debris Commissioners in February. Mr. Phipps stated that his main opposition to this dam, if any, would be the choking up of the still way, or outlet for the river, allowing the dam to overflow and thus wash the debris down the river. As the permit has been granted, Mr. Phipps says that if the Commissioners decide to oppose the working of these mines, it will be done by suits to enjoin them from hydraulicking. The tenor of his conversation was to the effect that the dam was satisfactory to them. The dam at Greenhorn, Nevada Co., will be commended. There are thirteen permits granted by the Commissioners in Placer Co., and of these only three are working. This is due wholly to lack of water, caused by the absence of the usual heavy rains.

Plumas.

The drift in the Bushman mine near Quincy has cut into the channel containing large deposits of gold-bearing gravel. The *National-Bulletin* says it is so rich it will pay from $15 to $25 to the pick.

San Bernardino.

Numerous miners are at work with their dry washers at the foot of the Pinto mountains, all making good wages. This is a large district and nuggets are found frequently. Some of them contain from $26 to $37 gold. One man brought in $185 worth of gold, which was the result of two weeks' work. Another made $22.50 in one day, $65 were obtained by another party in one week, and $85 in ten days. As the ground is now moist from the snow which recently fell, only the coarser gold could be saved by the dry washer, and the finer gold is lost in the tailings.

Shasta.

The mines at Harrison gulch are being worked with full crews, both night and day. The cyanide plant is also run full time.

Sierra.

(Special Correspondence.)—The South Fork Co. has reached pay gravel after long and persistent work. They are at a disadvantage, however, lamenting with other sections of the country the failure of snow and rains. The South Fork is an extensive property, and many thousands have been expended to reach the channel, which has been finally accomplished. The same company is operating the North Fork and Lucky Dog properties. All are owned in San Francisco.

The Hope at Alleghany, a quartz mine, is still driving its tunnels.

Forest City, Jan. 30th, '98.

P. Doray has leased his Slate creek claims for '98 to a La Porte company for $5000.

Owing to the severe cold weather the men employed at the Mt. Vernon and Sierra mines are laid off.

Siskiyou.

The Aromas M. Co., on the North Fork of Salmon river, have thirty-five men constructing a 2½-mile ditch from South Russian creek The company will use hydraulic elevators and up-to-date machinery in the development of their property.

News: The mining company of Luttrell & Wharton has commenced operations in their quartz mine in White's gulch.

On Ash creek, near Hornbrook, pockets of gold have been taken out that aggregate in the neighborhood of $10,000 within the last two months.

The Salmon River M. Co. are building a 7-mile ditch and flume to work gravel near Sawyer's Bar.

M. B. Shepardson is replacing his arrastra with a 5-stamp mill at his mine, Harrison Gulch mountain.

Journal: A nugget was recently taken out of Major Myers' quartz ledge in Quartz valley containing about $150 worth of gold. Work is still carried on day and night at the Greenhorn Blue Gravel mine near Yreka, with very good success, the yield averaging from about $800 to $1300 a week. Thirty men have been employed during most of the time, until the past few days, when a few men were laid off, owing to scarcity of water by the freezing at night. On Humbug, the cold weather has made tunneling into the old Spencer mine uncomfortable work, and the same cause retards operations in the Hegler and Cartwright & Phillips quartz mines, lately bonded by companies of capitalists in California and Colorado.

Trinity.

The mill of the Trinity Con. M. Co., on Dog creek, has closed down owing to cold weather freezing the water.

Tuolumne.

In the Kanaka mine several tunnels have been run a distance of 300 to 600 feet. The ledge is from 1 to 6 feet wide. A 10-stamp mill is in operation.

In the Jumbo mine, near Summerville, which is bonded to Scott, Dowe & Co., a shaft has been sunk to a depth 50 feet and rock which averages $5 per ton in free gold and extremely rich in sulphurets, is being extracted therefrom.

The fifteen stamps of the Keltz mill, at Sonora, are dropping on ore that is reported as good.

Preparations are being made for extensive gravel mining near Montezuma. Modern appliances will be used.

Work on the new 10-stamp mill for the Sell mine will commence this week.

The Maryatt 20-stamp mill, at Tuttletown, has started up.

When the shaft in the Junction mine, at Black Oak, is down 150 feet, different levels will be opened up. The ore is black sulphurets.

In Poorman's Friend another ledge has been discovered 4 feet in width.

The 20-stamp mill of the Shawmut mine has been running steadily since Dec. 5th. The bottom of the shaft is 900 feet below the croppings.

Yuba.

The ten stamps of the Good Title M. Co.'s mill crush three and a half tons per stamp. The additional five stamps will soon be completed. The shaft is down 300 feet. Stoping is going on above the 100-foot level, where the ledge if from 4 to 5 feet in thickness and is in good milling ore.

NEVADA.

(Special Correspondence).—The mines at El Dorado canyon, Lincoln county, are owned by the Southwestern M. Co. of Philadelphia, Chas. Tracey, Supt. and Mgr. They are from six to nine miles west from the Colorado river. The mill, a 15-stamp, is on the river at El Dorado canyon. The ore is hauled from mines to mill with mule teams. Grain, hay, merchandise and all supplies are freighted from here seventy-five miles. The mill is run by steam power, drift wood from the river being used for fuel. Indians catch and deliver the wood at $4 per cord. Under the above difficulties, $6 to $8 ore pays expenses, and the mill has only been run twelve hours per day, not being able to transport enough ore from mines to mill to keep mill running twenty-four-hour shifts. When the present management took hold the mines were said to be worked out and worthless. They have developed large ore bodies, and these mines are very valuable, proving that low-grade ore can be worked at a profit even in this desert country.

It is of interest to note that twenty years ago there was no gold in that district—that is, no one looked for gold—and it was said that there were no gold ledges that would pay. To-day there are no silver ledges that will pay, and, to visit the mines and test the ore, you would conclude that it has always been a gold camp.

Kingman, Arizona.

Record: The Summit mill has started up.

Pioche *Record*: J. E. Peck, who has a lease on the Bullionville pits, has expended some $30,000 in putting in his mill there, and is now in Chicago making final arrangements about his plant.

The De Lamar mine works its ore by the peroxide of sodium-cyanide method, and is locally credited with saving over 97 per cent of its value and works all ore containing over $5 per ton. Its mill treats 300 tons daily, and this one mine pays about 90 per cent of the bullion tax of Nevada.

The Diamond Co. of Eureka is hauling ore from its mines to the railroad depot on a bobsled, the carrying capacity of which is 100,000 pounds.

The Glasgow and Western Exploration Co.'s mill, Cherry Creek, has started up on sixty tons a day, with a capacity of 100 tons daily. At the property of the company at Golconda the mill is now in operation, with results which are satisfactory, while work on the smelter is progressing, and the plant promises to be in operation in the next ninety days. The smelter will have a capacity of 150 tons a day.

OREGON.

Valley Record: The handsome returns from Barron & Shepherd's milling test of ten tons from their mine on Samson creek, ten miles east of Ashland, has caused much interest to be manifested in that section, which is a new district in a mining way.

The first shipment of concentrates, consisting of four carloads, has been made from the Golden Circle mine at the Cable Cove, Baker county.

Baker City *Republican*: The Eureka has lately been the scene of a rich strike of a nature that proves the great stability of the ledge, which maintains the reputation of the Virtue district where so many fortunes have been unearthed by persistent prospectors. The mine is an extension of the Herbert, and the ledge is equally as rich and plentiful as its mother lode.

Jacksonville *Democrat*: J. C. Lewis will build a ditch from Placer to Leland, Josephine county, of ten miles. Three creeks now center at that place—Wolf and Coyote creeks, carried there by ditch, and Grave creek.

The Myrtle Creek Mining & Development Co., Jackson county, in their mines at the head of Johnson creek, at a depth of 50 feet, have a new ledge which prospects $10 in free gold.

Grant's Pass *Observer*: J. W. Robinson came in with $350 worth of gold dust—the result of an eight days' run at his Brass Nail gulch placer. One nugget in this batch was worth $138. Four other pieces range from $20 to $85.

WASHINGTON.

Reports of recent rich gold finds in the Mount Baker placer district are attracting increased attention to that section. During the past six weeks 100 locations have been filed at Mount Vernon, covering over 2000 acres, embracing nearly all the Baker river valley from the Whatcom county line to the confluence of the Baker and Skagit rivers.

The Kootenay water supply plant is to be converted into an electric power plant.

The Everett smelter will soon have in operation a large ore roaster. The building is 50x200 feet. There will be an upper and a lower hearth, each being 12x139 feet. The ore is fed into the upper hearth, and by the action of the ploughs is slowly conveyed to the other end, when it drops upon the lower hearth, where, after being moved the length of this hearth, it is ready for the furnace. The capacity of this roaster is seventy-five tons daily.

The Uncle Sam Mining & Development Co. has been organized at Bossburg to operate sixteen claims—eleven east of Bossburg and five on the Colville reservation.

BRITISH COLUMBIA.

Returns received from ore sent to the Nelson smelter from the Jubilee mine gave values at $3969 in gold and sixty ounces silver per ton.

The Wasco group, Champion station, Salmon river district, has been sold for $20,000 to the Wilkinson Exploration Syndicate of London, England.

P. Burns and W. McKenzie have bonded the Chieftain, on Cariboo creek, for $65,000.

Second Relief, near Creighton, Salmon river, has been bonded for $30,000.

There is excitement in Trout Lake City as the result of a clean-up of some surface gravel in the Lardeau placer mines, near there. From a little over a yard of dirt $81 was received. One of the nuggets weighed over $5, and none of the gold was finer than a large pin head.

The British American Corporation has bought over $3,000,000 worth of mining properties at Rossland.

C. H. McIntosh has resumed negotiations for the Le Roi mine at Rossland.

A rich strike was recently made on the Excelsior group, Slocan City, when two pockets were encountered while driving a raise from the tunnel. Assays from the ore discovered gave the remarkable returns of $136.80 in gold and 775 ounces in silver to the ton.

They are organizing a British Columbia chamber of mines at Vancouver, B. C.

Development work on Toad mountain properties, Nelson, is being pushed. The number of claims on which work is being done is five times as many as last winter.

The British American Corporation has commenced work on the Great Western at Rossland.

A contract has been let for the packing out of 600 tons of ore from the Velvet mine at Rossland.

Dunsmuir & Sons have advanced the pay of all underground workers in the Wellington collieries, Nanaimo, ten per cent.

Spokesman-Review: A Montreal dispatch

gives an insight to the deal which resulted in the sale of the holdings of F. August Heinze in West Kootenay to the Canadian Pacific Railway. It has been known for some time that Heinze's price was widely at variance with the offer of the Canadian Pacific Railway, but the figures have not been made public before The dispatch also sets forth why the deal has been delayed so long. It appears that Government officials have had a hand in the matter. Following is the telegram: "Carlos Warfield, first lieutenant of F. A. A. Heinze, the Rossland railway king, who has been here on and off for some weeks, has joined his chief in Montreal, and developments in connection with the Rossland railway question may shortly be expected. As previously stated, the Canadian Pacific Railway offered Heinze $800,000 for his smelter at Trail and his railway from opposite Robson to Trail and Rossland. Heinze wanted $1,300,000, and rather than pay such exorbitant figures the Canadian Pacific Railway determined to build an independent line to Rossland. But at this point Mr. Blair had to be reckoned with. He declined to approve of the Canadian Pacific plans, and without such approval the company could not stir a peg. Mr. Blair has been hounded from all parts of Ontario by stalwart liberals who want to see Toronto, Hamilton and London secure a fair share of Rossland trade, as against Spokane, and this they could not get, owing to Heinze's high railway rates. Blair has told Heinze that he cannot hold the Canadian Pacific Railway at bay any longer, hence Heinze will doubtless approach the company again with a view to resumption of negotiations. If the Canadian Pacific Railway acquired the smelter at Trail, an immediate drop in the cost of smelting might be looked for, with the immediate result of unlocking millions of Ontario capital."

ALASKA.

The Nowell G. M. Co., next to the Treadwell, is the largest gold mining concern in Alaska. The company recently went into the hands of Receiver Cassel, who makes a preliminary report of the liabilities and assets of the company to the court. The assets show real estate, mining and mill site, claims and improvements thereon, including development work and equipment, of $3,431,070.85. This amount represents the cost to the company of the property, of which amount $2,500,000 is represented by the capital stock of the company issued in payment for certain mining properties transferred to the company. The balance of the total amount, $931,070.85, is apparently the actual amount of money expended in developing and improving the property. Cash, materials and supplies on hand, due the company, in addition to the amount due from the Berners Bay M. & M. Co., $12,039 01; due from the Berners Bay M. & M. Co., $39,-853.80; total, $3,482 963 72. The total liabilities, including interest, due Jan. 1, '98, amount to $1,046,806.16.

When the 520 stamps are in operation the Alaska-Treadwell Co. will have 880 stamps on its vein, the largest number on a single ledge in the world.

THE KLONDIKE.

From Ottawa, is announced, officially, that after careful consideration, and with the advice of Wm. Ogilvie, the Canadian authority on the Yukon country, the Department of the Interior has decided upon the legal conditions which are to govern placer mining in the Yukon. The regulations in substance are as follows:

"Free miner" shall mean a male or female over the age of eighteen, but not under that age, or joint stock company, named in, and lawfully possessed of, valid existing free miners' certificates and no other.

A free miner's certificate shall not be transferable. This certificate may be granted for one year to run from the date thereof or from the date of expiration of the applicant's then existing certificate, upon the payment thereof of the sum of $10, unless the certificate is to be issued in favor of a joint stock company, in which case the fee shall be $50; for a company having a nominal capital exceeding $100,000, the fee shall be $100. Only one person or joint stock company shall be named in a certificate. This certificate shall also grant the holder the privilege of fishing and shooting, subject to provisions of law; the privilege of cutting timber for actual necessities; for the exclusive use of the miner himself, but such permission shall not extend to timber which may have been granted to other persons or corporations.

Certificates may be obtained by applicants in person at the Department of the Interior, Ottawa, or from the agents of Dominion lands at Winnipeg, Man.; Calgary, Edmonton, Prince Albert, in the Northwest Territory; Kamloops and New Westminster, B. C.; at Dawson in the Yukon district, also from the agents of the Government at Vancouver and Victoria, B. C.

No person or joint stock company will be recognized as having any right or interest in or to any claim unless he or it and every person in his or its employment shall have a free miner's certificate, unexpired. And, on the expiration of a free miner's certificate, the owner thereof shall absolutely forfeit all his rights and interest unless he shall, on or before the day following the expiration of such certificate obtain a new free miner's certificate. Nevertheless, should any co-owner fail to keep up his free miner's certificate, such failure shall not cause a forfeiture or act as an abandonment of the claim; but the interest of such co owner, pro rata, according to their former interests so provided, nevertheless, that a shareholder in a joint stock company need not be a free miner.

Every free miner shall, during the continuance of his certificate, have the right to enter, locate, prospect and mine for gold and other minerals upon any lands in the Yukon district, whether vested in the crown or otherwise, except upon Government reservations and land lawfully occupied. A creek, gulch, river or hill claim shall not exceed 250 feet in length in the general direction of the stream or ravine on which it fronts, and shall not be more than 1000 feet in width.

Every alternate ten claims shall be reserved for the Government of Canada; that is to say, when a claim is located, the discoverer's claim and nine additional claims adjoining each other and numbered consecutively will be opened for registration. Then the next ten claims of 250 feet each will be reserved for the Government, and so on. The penalty for trespassing upon a claim reserved for the crown shall be immediate cancellation of any entry or entries which the persons trespassing may have obtained, whether by original entry or purchase, for a mining claim, and the refusal of the acceptance of any application which the person trespassing may at any time make for a claim.

If any free miner or party of free miners discover a new mine, and such discovery shall be established to the satisfaction of the Mining Recorder, creek, river or hill claims of the following size shall be allowed:

To one discoverer, one claim, 500 feet in length; to a party of two discoverers, two claims, amounting to 1000 feet in length; each member of a party beyond two in number a claim of the ordinary size only.

A claim shall be recorded with the Mining Recorder in whose district it is situated within the ten days after the location thereof. The entry shall not be granted for a claim which has not been staked by the applicant in person in the manner specified in these regulations.

An entry fee of $15 shall be charged the first year, and an annual fee of $15 for each of the following years. A royalty of 10 per cent on the gold mined shall be levied and collected on the gross output of each claim. The sum of $2500 shall be deducted from the gross annual output of a claim when estimating the amount upon wich the royalty is to be calculated, but this exemption shall not be alliowed unless the royalty is paid at a banking office or to the Gold Commissioner or Mining Recorder.

Regulations have also been adopted for the issues of leases to persons or companies who have obtained a free miner's certificate to dredge for minerals other than coal in the submerged beds or bars of rivers in the provisional district of Yukon, in the Northwest Territory. They provide that:

The lessees shall be given the exclusive right to subaqueous mining and dredging for all minerals with the exception of coal in and along an unbroken extent of five miles of a river. No more than six such leases will be issued in favor of an individual or company, so that the maximum extent of river in and along which any individual or company shall be given the exclusive right above mentioned shall under no circumstances exceed thirty miles. The lease shall be for a term of twenty years, renewable in the discretion of the Minister of the Interior. The lessee shall have at least one dredge in operation upon the five miles of river leased to him within two seasons from the date of his lease, and if during one season, when operations can be carried on, he fails to efficiently work the same to the satisfaction of the Minister of the Interior, the lease shall become null and void, unless the Minister of the Interior shall otherwise decide; provided, that when any company or individual has obtained more than one lease, one dredger for each fifteen miles or portion thereof shall be held to be compliance with this regulation.

The lessee shall pay a rental of $100 per annum for each mile of river so leased to him. The lessee shall also pay to the crown a royalty of 10 per cent on the output in excess of $15,000.

UTAH.

On the 425-foot level of the Black Dragon they cut through a 14-foot vein, with pay streaks all through it.

The Sunbeam Con. M. Con. is drifting for the downward continuation of the rich ore found in the Woodmansee ground.

Mercur *Mercury*: In the Daisy the vein is being crosscut every 30 feet, and in many instances on the lower levels shows a width of from 20 to 25 feet. Ore bins are being put in at the end of each drift to facilitate the handling of the ore, and the mine is being put in shape for large extraction when the time comes. There are already 1800 feet of development in ore.

Salt Lake *Tribune*: The Creole at Stateline has excellent prospects. The shaft is now down 250 feet, where a station is being put in, and there is a lot of $22 gold ore in sight. The company feels safe in doubling its mill, and cyanide tanks will be added, as by the present system only 78 per cent of the gold is saved.

Tribune: At the Highland Boy, Bingham, 30,000 feet of tunnels, including drifts and crosscuts, have been laid bare. Oxidized ore has been found in paying quantities, while the copper deposits are rich. The capacity of the mill is fifty tons of oxidized ore, while forty tons of copper ore are daily sent to a smelter. The mill has a leaching capacity of 500 tons, divided into ten tanks of fifty tons each. There are two crushers, with two driers of seventy-five tons each. An air compressor is installed in the No. 6 tunnel. It will operate three drills.

The Highland Boy mine, at Bingham, is turning out regular shipments of crude copper ore, in addition to eighty tons that are being furnished the mill.

Tribune: The Ajax M. Co. reported with 100 tons of ore from its property, that yields as much as 29 per cent in copper, five ounces in silver, and gold of the value of $1 50 a ton.

The Steamboat M. Co., at Park City, is putting in a water plant to run drills so as to facilitate work in the long tunnel they are running in their property at the head of Snake Creek canyon.

Record: An upraise is being made at the Valeo to connect the tunnel with the incline on the ledge from above.

The Ontario mill, at Park City, is to be closed down, the old plant removed and a modern one put in, as it has outlived its usefulness of nearly twenty-one years continuous dropping.

IDAHO.

(Special Correspondence.)—The property of the Mascott G. M. & M. Co., Ltd., is in Pierce City mining district, Shoshone Co. At a depth of 100 feet drifts will be started. The company has already ordered a mill and will place an amalgamator. The ledge is 3½ feet in width, free milling. Assays have ranged from $26.11 to $450.60 per ton.

De Lamar *Nugget*: The west half of what is known as the old De Lamar mill, is now undergoing a change amounting to a revolution in the mill process. Some pans and their accompanying settlers have been torn out, and the space they occupied is being filled with iron leaching tanks. There will be ten of these tanks put in, averaging in area 10 feet by 20 feet with a depth of 3½ feet, and two large circular storage tanks, to hold cyanide solution. As soon as this part of the mill has been revolutionized and satisfactorily tested, it is probable that the stamps will all be hung up and the same change be made in the other half of the pan mill. It is believed by the manager that the new process will save an equal percentage of values, and it is certain that it will effect a large saving in expense, because the power required to run the batteries, pans and settlers will be dispensed with. Five hundred cords of wood were consumed per month when all the pans and batteries were running, and with the new process only the rock breakers will be employed, and that only on a minor portion of the ore. The total amount of ore crushed in December was 4350 tons. The value of the bullion produced in the mill was $38,820, and the total income was $40,370. The expenses were $39,365, leaving a profit for the month of $1005 An air compressor weighing 8000 pounds and fly-wheel weighing 3500 pounds are being put in the mine.

The Hoodoo Hydraulic Gold M. Co. at Princeton has its giant and flumes in position to take advantage of the first chinook in the spring.

MONTANA.

In the Nippur mine in Butte the Montana Ore Purchasing Co. has cut a 40-foot lead of copper ore on the south crosscut at the 550-foot level.

The Montana Ore Purchasing Co. extracts from the Rarus and Glengarry mines nearly 700 tons of copper ore every twenty-four hours.

Miner: A new company is being formed in Butte of local mining men and capitalists to work the Hesperus lode.

The Basin Gold & Copper M. Co. has been formed to operate the Hope mine at Basin. Men have been engaged to remove the water, when the shaft will be developed from the 300 to the 500-foot level. The Hope is credited with producing over half a million dollars' worth of ore and paying $200,000 in dividends.

The Hope mine at Basin will resume operations shortly under a new management.

In the Heart Solo mine, Brown's Gulch, they have uncovered a body of ore. They will send nine tons to the Butte smelter for a test.

In fifteen years Montana's annual copper output has risen from 9,058,284 pounds to 250,-000,000 pounds. From the Butte district alone, during this period, $200,000,000 worth of copper has been taken.

Butte *Inter-Mountain*: The Boston & Montana, with its continuous ore body from the Mountain View to the West Colusa, has a reserve that cannot be exhausted in many years. The Butte & Boston mines will be producers this year. The Parrot Co. is engaged in opening up new properties. The Heinze properties add to the output; the Gagnon, Original and Colusa-Parrot are still contributors, and will be for years to come.

The Kennett M. Co.'s new 40-stamp mill at Sheridan is crushing about 120 tons of ore a day.

WYOMING.

Lander *Clipper*: Cook & Richardson are working the old Caribou mine on a lease. At a depth of 75 feet the vein is 2 feet 4 inches wide. This mine has a record of $500,000.

The Empire State mine, Atlantic City, has been sold to Salt Lake parties for $18,000.

SOUTH DAKOTA.

T. J. Grier of Deadwood, Supt. of the Homestake mine, says it operates 400 stamps and handles 2800 tons of ore daily. It and several other contiguous mines are chiefly the property of the Hearst estate and J. B. Haggin. Last year their combined production was in round figures something like $3,250,000. Throughout the State there is great activity in mining, and there is every reason to believe that the production of '98 will show a large increase over last year.

MICHIGAN.

Geo. Wagner has completed his report on the conditions of upper peninsula mines and miners of Michigan and forwarded it to Labor Commissioner Cox. The Lake Superior district last year produced nearly three-fourths of the iron mined in the United States, the output being 12,000,000 tons in that State. The Marquette range led with 2,591,496 tons, 2969 men employed; Gogebic, 1,710,509 tons, 2252 men; Menominee, 1,335,000 tons, 2107 men; Crystal Falls, 276,000 tons, 497 men; total, 5,943,000 tons, 8825 men. The copper mines, exclusive of the Calumet & Hecla, produced 58,497,170 pounds of ore and employed 4540 men, of whom 1087 were in the Quincy and 1087 in the Tamarack.

MISSOURI.

State Mine Inspector Quinby of Missouri reports that if present conditions are maintained to the end of the fiscal year the four counties of Jasper, Newton, Greene and Lawrence will produce more than $3,000,000 worth of ore. He says a large amount of capital was invested in developed and undeveloped mining lands during the year 1897, most of it coming from St. Louis and Kansas City, and he thinks that the profits on the output of Missouri lead and zinc mines this year will be great. He reports that Missouri is enjoying the greatest period of mining activity it has ever known.

COLORADO.

In working the Old Settler property on the divide between Trail Run and Turkey creek they found a vein along the surface, with free gold in the quartz. The values are said to be high in gold.

The Quaker Co., operating the Monte Cristo property on Spanish Bar, recently began a crosscut from the bottom of the shaft for the purpose of reaching a parallel vein some 35 feet away. This has now been reached and the streak of high-grade ore running $100 per ton is about 12 inches wide.

They are sinking a winze in the Seaton mine, Idaho Springs, to connect the second level with the third. This will go down on the new showing of high-grade mineral which was recently found by crosscutting from one wall to the other. The mine is also producing a heavy tonnage of this and milling ore, and the output for the coming year will about double that for 1897.

In working the Excelsior claim on Dry gulch a new streak of mineral was encountered, which shows 5.43 ounces gold and 676 ounces silver.

The Mayhem Investment Co. of Denver has paid $40,000 for the Village Belle mine, and the El Dorado G. M. Co. bought the Enterprise and Bobtail mine for $100,000 cash and $50,000 in stock. Both mines are located at El Dorado.

After several years of work the Dollie B. mine, in Big Evans gulch, has become a producer. A short time ago a large body of pay ore was discovered and after it had been developed and shown to be continuous shipments were commenced. The ore carries both gold and lead.

A shaft sunk on the G. M. Favorite, Leadville, has exposed quite a body of gold-bearing ore at the depth of 350 feet.

Colorado Springs *Telegraph*: Preparation is being made to open up the big ore chute of the Ingham at great depth. Excavations have been completed for the installation of a big plant of machinery to sink the winze from the tunnel level. The winze will be sunk off the vein a distance of some 25 feet, and will cut the ore on its dip. The ore body at present opened up at the lowest, or 265-foot, level is from 12 to 18 feet in width, though it is only being taken out at present to a depth of 10 feet. The vein matter runs about an ounce and a half of gold to the ton.

A Colorado Springs dispatch says the gold production of the Cripple Creek district during the month of January was in round figures $1,200,000. The dividends declared by the eleven mining companies operating there amounted to $146,000, while fully $75,000 more was cleared up by mines under private ownership.

At Aspen the Free Silver pumps are to be pulled. This is locally interpreted as meaning that deep mining in the Aspen district is at an end for several years, and that deep mining there has proven a failure. Some 10,000 feet of workings will be flooded, including the lower workings of the Mollie Gibson.

Silverton *Miner*: The Neigolds, Cunningham gulch, broke into 18 feet of ore which averages from $15 to $20 per ton and carries galena values.

Record: After sinking 78 feet and crosscutting 55 feet, the Whitehorn Mines Co., at Whitehorn, has cut a 4-foot vein on the Bruce carrying gold.

In Cameron district several properties have been bought or leased by men who will develop them. Cripple Creek men are in the district, getting possession of claims.

Denver *Mining Record*: An ore chute has been opened in the Monte Christo claim, Copper mountain, belonging to the Magnet Rock G. M. Co. Many have prospected for ore on this property. At the bottom of an 80 foot winze, from the bottom of the 120-foot level, what looks like the apex of a good ore chute has been opened. The operators think they have encountered an extension of the famed chute from which shipments have been made in the Columbia tunnel.

The best part of the Christmas mine on Bull hill is now being operated under a two years' lease. Ore is shipped at the rate of thirty tons per week, running from one to two ozs., from the fifth level, at a depth of 238 feet.

Colorado Springs *Telegraph*: Samuels & Co. have developed the first producing mine on Carbonate hill, and, to all appearances, they have a splendid proposition in their lease on the Elkhorn. They recently opened the ore body in a 50-foot crosscut from the 190-foot shaft and are now starting drifts on the vein. The pay streak is about 16 inches in width and yields ore of an average value of over $100 in gold.

In running the Cowenhoven tunnel, at Aspen, they ran into mineral in the quartzite which assays eighty ounces in silver to the ton, besides a good percentage of lead.

Telluride *Journal*: The Dunlap group of prospects, in Gray's basin, a branch of Bridal Veil, have been bonded to W. F. Buckley for $32,500.

NEW MEXICO.

The Homestake, Maud M. and Ajax, in Pioneer gulch, show an improvement in the quantity and quality of ore.

The production of coal in New Mexico for the fiscal year ending June 30, 1897, is as follows: Bernalillo Co., 235,937 tons; Colfax Co., 203,537; Lincoln Co., 4000; Rio Arriba, 21,400; Santa Fe Co., 225,000; San Juan Co., 1825; a total of 733,839 tons. The estimated value of this total product at the mines is $1,198,915. The total number of men employed in and about the mines is reported as follows: Miners, 1154; outside men, 171; boys, 40; a total of 1365.

La Belle *Cresset*: The owners of the Blue

Copper Glance expect to resume work in February. Five-pound samples from this property, 5 feet from surface, gave gold values of $12.40. The vein is known to run strong in copper.

The Edison mine at La Belle has been sold.

ARIZONA.

(Special Correspondence). — The Virginia Camp is in the southern portion of the old Weaver district, about ten miles east from the Colorado river, and about twenty-five miles in a northwesterly direction from Chloride, Mojave county. The camp was discovered one year ago by Cook Bros. & Blythe. The ore is white spar and carries from $5 to $300 per ton is gold, very little silver. The white spar ledges in this camp have been known of for many years, but they were white spar, and the prospector knew white spar did not carry mineral, so there was no need of testing the ore. There is an old trail that crosses one of the best ledges, having been traveled for many years. On either side of the trail the ledge shows free gold in many places, but no one would look at gold in white spar. On the Virginia mine the ledge has been crosscut by 30 feet of open cuts and shows 7 feet of ore, value $100 per ton. The Tennessee mine has a shaft 15 feet deep, exposing a 4-foot ore body. The Bee Hive mine shows an ore body 12 feet wide, of good value. Cook Bros. & Blythe have a number of claims from which they have shipped ore yielding $100 per ton at the sampling works. The Blue Jay and Tillman are promising prospects owned by Gatewood & Tillman, much of the ore yielding $100 per ton free gold.

For steam generating, coal instead of wood is being used by the mills at Tombstone.

Old Glory 30-stamp mill, at Oro Blanco, is running steadily on good paying ore.

S. Y. Barkley will resume work in the Old Boot mine in Silver Ball mining district. This mine was at one time a large producer of bullion.

Nogales *Vidette*: It is reliably reported that the Columbia Smelting Co., at Rollin, will start up again soon, and that all the indebtedness of the present company will be liquidated by the new company.

At Oro Blanco the Franco-American Mining Co.'s mines are developing very handsomely. There is a large body of ore in sight and occasionally very rich specimens of copper are found. The mine also carries gold in a most satisfactory manner. The Old Glory 30-stamp mill is running steadily on good ore, and it is understood that the mine is paying well.

The 10-stamp mill at the Fuller group of mines, Squaw creek, is running steadily.

Yuma *Sun*: B. A. Haraszthy has bonded his Gila City district group of placer claims, consisting of the Golden Slipper, Happy Jack, Blue Mine, Gold Deposit, Eclipse and St. Patrick claims, to A. S. Adams of San Francisco for $30,000. J. H. Johnson of Kansas City has secured a bond on the Ophir, Little Lizzie, Colorado and Bob Ingersoll mines, three miles from Harrisburg, from R. Toohey of Phœnix for $75,000.

MEXICO.

At Minas Prietas, Sonora, the Grand Central mines were purchased by the Exploration Company of London in August, 1896. The profits for the first year's operations were £81,000, of which £37,500 was paid in dividends. The mine is paying steadily under the management of E. R. Abadie. The new shaft is 860 feet deep, and the ore body has been opened on the seventh and eighth levels for over 200 feet and an average width of 16 feet. The shaft has four compartments and is fitted with a 500 H. P. hoist, having a capacity for 3000 feet. The mill contains thirty rapid-drop stamps.

El Mundo announces that the gold production of Mexico for last year was $6,861,826—a gain of more than $800,000 over '96 and of more than $2,000,000 over '90.

Two Republics: Messrs. Reed and Gunny, the gentlemen who purchased the San Luis mine near Coronilla last January, in the State of Guerrero, are now negotiating for the mines and mill belonging to the Compania Mexicana in the district of Mina. The mines are situated near Coronilla, San Nicolas del Oro and Tepantitlan and are about thirty in number. The mines near Coronilla yield gold; those near San Nicolas del Oro yield gold and silver and those near Tepantitlan yield gold, silver and lead. Most of the ore mined from these properties has been treated in arrastras. At present there is a 5-stamp mill on the San Cayetano, and we understand it is the intention to increase this plant considerably. The San Felipe mine still continues to yield very rich gold ore. This is the only strictly gold property that has been discovered near Coronilla thus far. All the others carry considerable quantities of silver also.

Mexico has adopted a new mining law as follows: Art. 1. Upon the expiration of the three months period, fixed by Art. 13 of the mining law, during which the explorer only has a right to acquire mining claims, no new exploration permits will be recorded on the explored land, nor will notices of intended exploration work be admitted for the same ground until after the expiration of six months, during which the ground will be open and free for the acquisition therein of mining claims. In places where possession of mining claims has been obtained, explorations may only be made on ground two hundred meters distant from the boundaries of those claims and in abandoned mines. In all cases, the explorer must define the location and the boundaries of the ground with clearness and precision.

Art. 2. The agents of the mining departments shall post upon the board of notices at their offices a copy of all permits, notices or administrative acts, referred to in Art. 13 of the mining law, fixing at the end of such copies the exact dates of beginning and termination of explorations.

Under this new law, exploration privileges cannot be renewed on mining zones after the expiration of the first three months, until after an intermission of six months, during which six months the land will be open to the location of mining claims. The new law corrects three abuses in the old law. First, it prevents the keeping of lands tied up under the cover of the zone permit for years by renewing the zone every three months. Second, the practice of having indefinite boundary lines for such zones is abolished. One cannot locate a zone with the broad statement "my zone is eight leagues square with such a mountain for its center." The new law requires that the boundary lines of each zone must be clearly defined in the permit. Third, all zone permits, giving the exact boundary lines of each zone, must be kept posted on the notice boards in the office of the mining agent of the district in which the zone is located, for the inspection of any person interested, and the permit must show the dates of the beginning and ending of the three months' life of the zone. Heretofore, information of this character was not easily obtained and it was an easy matter for an explorer to renew his zones without any one knowing when the three months expired.

CHINA.

United States Consul Fowler of Ningpo, China, in a recent communication, writes as follows: "Vast untouched beds of sheet mica lie within fifty miles of Kiao-Chow bay. The extent of these mica deposits is as yet unknown, but, so far as I have investigated, they promise to handsomely repay those who are fortunate enough to obtain a franchise for working them. The rolling, sandy hillocks, under which the mica lies, are but poor lands for cultivation, and hence their use for mining purposes detracts nothing from the cereal-producing capacity of the region. The mica crops out at intervals over some fifty square miles and in veins sometimes 10 feet thick. Of course, much of it is discolored by foreign minerals, but what I have seen assures me that there are vast quantities of good commercial material."

COREA.

The report of Consul-General Mann at Seoul, Corea, gives information concerning the United States gold miners' concession in that country. The report says the gold district is twenty-five miles in width and includes the richest country in Corea. The concession is for twenty-five years and includes the right to mine other minerals. J. R. Morse, who has the concession, has granted a sub-concession to another American, L. Hunt, who has succeeded in interesting American capital to such an extent that a sub-company will shortly install a modern mill of forty stamps. The whole country has been honey-combed by native miners in the past, and, to promote further prospecting, these people are given the mining rights for one year on the new property. The Corean miners are patient, strong, enduring and easy to deal with. Their wages are about 40 cents a day in silver. The report says water is the greatest obstacle.

MINING ENGINEER

Of experience desires engagement as superintendent, or to open mines, or to exploit mining properties. Address "ROBERTS," Mining and Scientific Press, San Francisco.

WANTED,

Position by a reliable and thoroughly experienced mine bookkeeper, time and stockkeeper, general merchandise clerk, typewriter and stenographer. Age 25. Can furnish own typewriter Location no object. References. Address J., Mining and Scientific Press.

Position as Manager or Superintendent of Mines and Mill.—A mining engineer of 20 years' practical experience in mining, milling and placer mining, understands construction and operation of stamps, Huntington's and roller mills, amalgamation and concentration to any degree of fineness with jigs, buddles, vanners, bumpers, and Wilfley tables; makes surveys, maps and plans of mines and mills, and does practical assaying; experienced in handling free gold, and sulphurets of iron, copper, lead, zinc and quicksilver; can examine and report on mines; will be open for engagement about March 1, 1898. Box 30, Mining and Scientific Press.

"QUICKSILVER."

WANTED,

A Competent Metallurgist

To fit up and take charge of

Quicksilver Reduction Works in the Transvaal.

Give full particulars as to practical experience, salary required and copies of testimonials to

GOLDREICH BROS.,

Box No. 933, Johannesburg, South Africa.

AN EXPERIENCED

Sampler, Assayer and Analyst

Desires Position with Mining, Milling or Smelting Company.

Thoroughly competent in sulphides of silver, bullion, mattes, concentrates, ores, etc. Excellent references. Speaks Spanish. Address SAMPLER, care of Mining and Scientific Press.

TO MINE SUPERINTENDENTS.

AN EXPERIENCED SURGEON, Graduate of Regular School.

Offers his services to one or more mines employing a sufficient number of men, or if the number be not sufficient to compensate him, he would undertake to do the ordinary ore assaying for the mine to a limited amount. Address MEDICUS, care of Mining and Scientific Press.

WANTED.

WILFLEY CONCENTRATOR.

Must be Guaranteed in Perfect Condition, of the Latest Design and Cheap for Cash.

Address WILFLEY, care of Mining and Scientific Press, San Francisco, Cal.

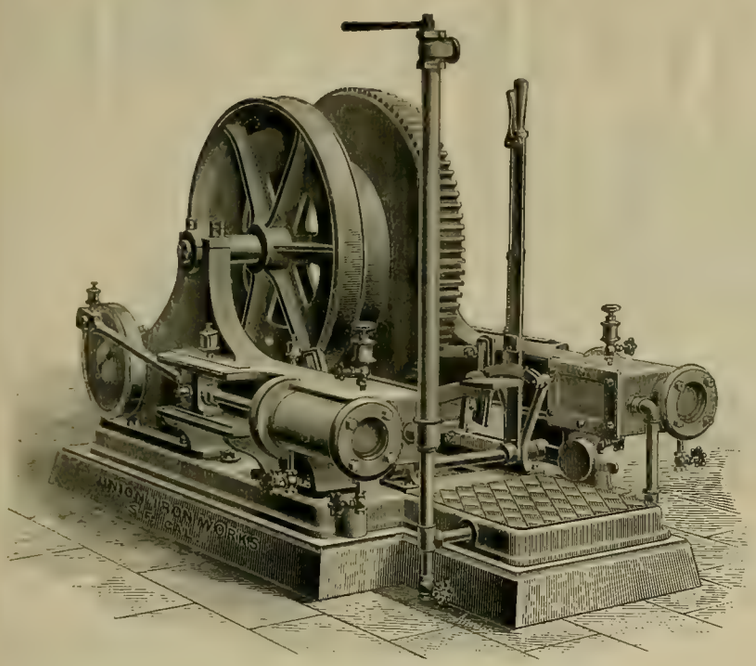
Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Mill Construction, Assaying, Blow-Pipe Analysis, Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application

The College has also Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.



Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal

UNION IRON WORKS,

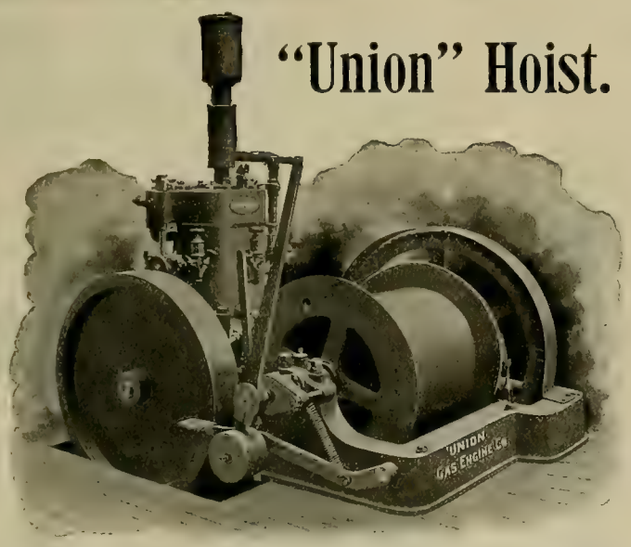
★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,



USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

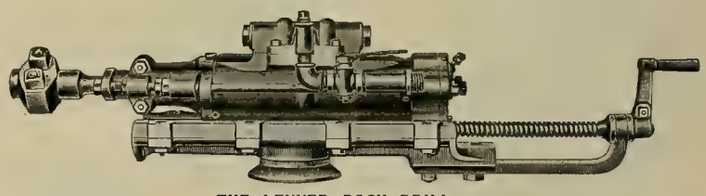
"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,



Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions.

OSBORN'S MINERALS, MINES AND MINING.

RECENTLY PUBLISHED:

A Practical Manual of Minerals, Mines and Mining: Comprising Suggestions as to Localities and the Associations of all the Useful Minerals. Full Descriptions of the Most Effective Methods for Both the Qualitative and Quantitative Analyses of Each of these Minerals and Hints upon the Various Operations of Mining, including Architecture and Construction. By Prof. H. S. Osborn, LL.D., Illustrated by 171 engravings. Second edition, revised and enlarged. 333 pages, 8vo. Price.....**$4.50**

By mail, free of postage, to any address in the world.

ALSO JUST PUBLISHED:

The Prospector's Field Book and Guide in the Search for and the Easy Determination of Ores and other Minerals. By Prof. H. S. Osborn, LL.D., Illustrated by 58 engravings. Third edition, revised and enlarged.

In One volume, 12mo, cloth, 275 pages, price $1.50.

CONTENTS—Chapter I. Preparatory Instruction; II. Crystallography; III. Surveying; IV. Analyses of Ores—Wet Method; V. Special Mineralogy—Gold; VI. Platinum, Etc.—Silver; VII. Copper and How Measured in Ores; VIII. Lead and Tin; IX. Zinc—Iron; X. Mercury, Bismuth, Nickel, Cobalt, and Cadmium; XI. Aluminum, Antimony, Manganese, and Other Minerals; XII. Petroleum, Ozocerite, Asphalt, Peat; XIII. Gems and Precious Stones. Appendix: Weights and Measures; Specific Gravity; Boring; Chemical Elements; Glossary, etc.

☞ *Price $1.50 by mail, free of postage, to any address in the world.*

☞ *Two Circulars of 4 pages each, giving full Tables of Contents of the above books, sent free to any one in any part of the world who will furnish his address.*

WE ALSO PUBLISH:

The Assayer's Guide; or, Practical Directions to Assayers, Miners and Smelters, for Tests and Assays, by Heat and by Wet Processes, of the Ores of all the Principal Metals, of Gold and Silver Coins and Alloys, and of Coal, etc. By Oscar M. Lieber. A new, revised and enlarged edition. Illustrated. 293 pages, 12mo. Price.....**$1.50**

The Practical Surveyor's Guide: Containing the necessary information to make any person of common capacity a finished land surveyor, without the aid of a teacher. By Andrew Duncan, Land Surveyor and Civil Engineer. A new, revised and greatly enlarged edition. Illustrated by 72 engravings; 214 pages, 12mo. Price.....**$1.50**

The Assayer's Manual: An Abridged Treatise on the Docimastic Examination of Ores and Furnace and other Artificial Products. By Bruno Kerl, Professor in the Royal School of Mines. Translated from the German by William T. Brannt. Second American edition, edited with extensive additions by F. Lynwood Garrison member of the American Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhuttenleute, etc. Illustrated by 87 engravings; 354 pages, 8vo., cloth. Price.....**$3.00**

☞ *Our New and Revised Catalogue of Practical and Scientific Books, 92 pages, 8vo., and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.*

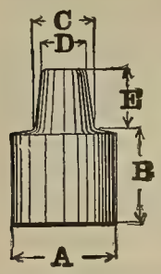
PATENTS



DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

B. L. WINCHELL,
G. P. A. Un. Pac., Denver & Gulf R'y.,
DENVER, COLO.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

For the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco.

Pacific Placer Machine.

Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our larger Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb, 400 lb, 550 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.

For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

STAMP SHOES.

STAMP DIES.

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

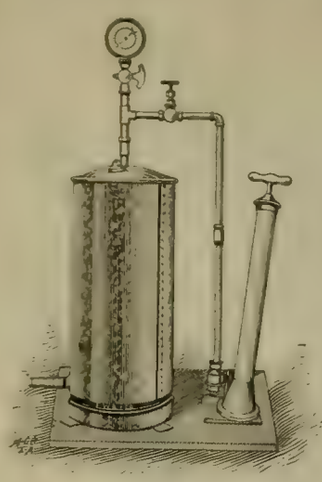
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS & CO., Agents, 141 and 143 First Street, San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

H. D. MORRIS & CO., DEALERS IN MINING MACHINERY AND SUPPLIES.



141-143 First Street, San Francisco, Cal.

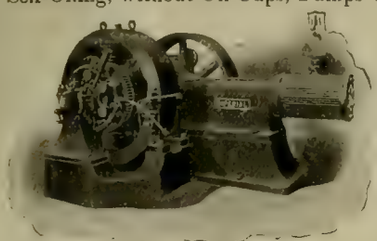
MANHATTAN RUBBER BELTING, PACKING AND HOSE,
SANDERSON DRILL STEEL,
MORRIS CENTRIFUGAL PUMPS,
LIGHT STEEL RAIL.

CHARLES B. BOOTHE & CO.,
LOS ANGELES.
Mining and Milling Machinery and Supplies.

SMITH-VAILE PUMPS, (For Every Purpose.)
MINING HOISTS, (Bolthoff's Latest.)
TRUAX AUTOMATIC ORE CAR, (We Make 'em.)
HORSE WHIMS, WINDLASSES, BUCKETS AND SKIPS.
BLOWERS, FORGES, PIPE TOOLS.
ENGINEERS' SUPPLIES.

CANTON Drill, Groove and Pick STEEL.
Costs no more than is asked for inferior Steel; and is guaranteed equal to Jessop's best.

Assayers', Miners' and Chemists' Supplies.



Crucibles, Muffles, Furnaces, Etc.
C. P. CYANIDE POTASH (98-99 per cent.)
DIOXIDE SODIUM, ZINC SHAVINGS, BORAX GLASS, C. P. TEST LEAD,
GASOLINE TANKS,
And everything required by Assayers, Miners and Chemists.

Write for a copy of our New Illustrated Catalogue.

F. W. BRAUN & CO.,
401 to 407 N. MAIN STREET,
LOS ANGELES, CALIFORNIA.

The IMPERIAL ENGINES.

Self-Oiling, without Oil Cups, Pumps or Tanks. Adjustable and accessible bearings. Renewable bushings for main and rocker arm bearings. Frictionless four-admission slide valve. Oil chamber entirely separated from steam cylinder contact. Rite's inertia governor. Perfect regulation. All sizes. Simple or compound. Belted or direct connection. High, medium or low speed. Designed for every use.

WESTON ENGINE CO.---Painted Post, N. Y.
C. B. BOOTHE & CO., Los Angeles, Cal., Gen'l Western Ag'ts.
HENDRIE & BOLTHOFF M'F'G CO., Denver, Ag'ts for Colorado.

THE MACHINERY & ELECTRICAL CO.,

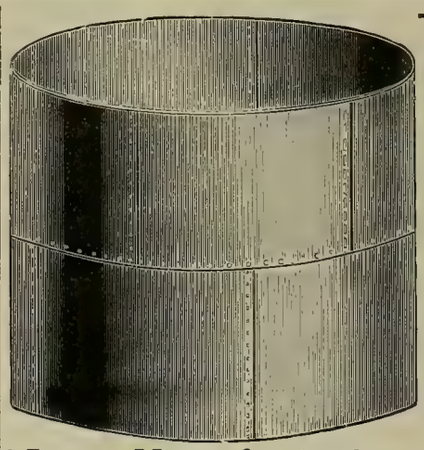
Southern California and Arizona Agents for
Gates Iron Works Mining Machinery.
Stamp Mills, Ore Crushers, Ore Cars, Etc.
Tremain Steam Stamp Mills.
Oil City Boilers and Engines.
Snow Duplex Mine and Sinking Pumps.
Hercules Gasoline Stationary and Hoisting Engines.
Bates Corliss Engines. Ideal Automatic Engines.

Also Dealers and Jobbers in
Machinery and Electrical Supplies.
Shafting, Belting, Pulleys, Packing, Etc.
Incandescent Lamps, Samson, Edison, Leland Batteries.
Construction of Electric Light and Power Plants a Specialty.
Correspondence Invited.

351 and 353 N. Main St., Los Angeles, Cal.

Mining Timber

WRITE TO-DAY and let us make an estimate on your next order for LUMBER, SHINGLES, SHAKES and R. R. TIES. We make a specialty of MINING TIMBER and PLANK for Arizona and Mexico shipment.



The L. W. BLINN LUMBER CO.,
Main Office, 348 E. Second St. = LOS ANGELES, CAL.

BAKER IRON WORKS,

950 to 956 BUENA VISTA STREET, LOS ANGELES, CAL.

Stamp Mills a Specialty (from two-stamp up). HOISTING ENGINES. Agents for Henry R. Worthington STEAM PUMPING MACHINERY and the ATLAS ENGINES AND BOILERS. General Foundry Work and all kinds of Heavy Forgings. Oil and Water Well Tools. CORRESPONDENCE SOLICITED.

Manufacturers of MINING AND MILLING MACHINERY.

PIPE!

We manufacture Water Pipe for
Hydraulic Mining and Irrigation.
IRRIGATION SUPPLIES OF ALL KINDS.
WELL CASING, OIL TANKS, —AND— General Sheet Iron Work.
Write to us for an estimate on your next job.

Lacy Manufacturing Co., Office, Room 4, Baker Block, LOS ANGELES.

RIVETED STEEL WATER PIPE.
THOMSON AND BOYLE PIPE CO., MANUFACTURERS.
310-314 REQUENA ST LOS ANGELES, CALIF.

Water Pipe for Placer, Hydraulic and Quartz Mining a Specialty. Made up complete, or cut, rolled and punched to be riveted at mine. Well Casing; Oil, Water and Cyanide Tanks; Galvanized Air Pipe; Ore Cars and Ore Buckets, and all kinds of Sheet Iron and Steel Work. Mail orders promptly attended to. Correspondence Solicited.

Market Reports.

The Markets.

SAN FRANCISCO, Feb. 3, 1898.

Business continues fairly active, with the volume of goods going out in excess of the corresponding time in 1897. The buying continues of a conservative character, owing to dry weather in the agricultural sections and cold weather in the mines, freezing the water supply in many districts. The outfitting for the Klondike is quite a factor in trade circles. With the opening of navigation on the Yukon the call for goods from that section will be very large. It is stated that the demand for mining implements and machinery will be large also. The activity in barge, steamboat and steamship building for Alaska is calling for liberal supplies of hardware and machinery, and at the same time giving employment to several hundred extra men.

The local money market is practically unchanged. The supply is in excess of the demand with prospects not favorable for any increase for some time to come. The dry weather is creating uneasiness with the timid; even the more conservative are not disposed to put out much money in sections that are likely to be affected unfavorably by a drouth. Good soaking general rains within the next two weeks will change the complexion of things and create a feeling of confidence. The disbursements of funds in this city last month by corporations and municipal, State and national authorities aggregate over $5,000,000, the bulk of which has gone back into banks. The disbursements that are being made by persons going to the Klondike are increasing in volume, which adds still more to the plethora of funds. The East reports a steadily increasing ease in the markets, with the holdings largely in excess of trade wants. This makes the rates of discount easy.

New York Silver Prices.

NEW YORK, Feb. 3. — Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	26¼	56⅞
Saturday	26 5-16	56¾
Monday	26¼	56½
Tuesday	26⅛	56¼
Wednesday	26 1-16	56⅜
Thursday	26	56⅜

	Copper.	Lead.	Iron.	Tin.
Fri.	10 90 @11 00	3 60	10 00@12 25	13 85
Sat.	10 90 @11 00	3 60	10 00@12 25	13 85
Mon.	10 90 @11 00	3 57½	10 00@12 25	13 85
Tue.	10 90 @11 00	3 57½	10 00@12 25	13 85
Wed.	10 90 @11 00	3 55	10 00@12 25	13 80
Thur.	10 90 @11 00	3 55	10 00@12 25	13 80

The local bullion, money and exchange quotations current are as follows:

Commercial Loans, % per annum	6
Commercial Loans, prime	5
Call Loans gilt edged	4@4½
Call Loans mixed securities	5@6
Mortgages prime, taxes paid by lender	6@8
New York Sight Draft	17½c Prem
New York Telegraphic Transfer	20c Prem
London Bankers' 60 days	$4.82¾
London Merchants	$4.81½
London Sight Bankers	$4.85½
Refined Silver, per oz., 1000 fine	58¾
Mexican Dollars nominal	47@—

SILVER.—The market has shaded off the past week in sympathy with Europe, where the uncertainty of complications over the Eastern question is quite a factor. The continued stringency in the money markets of India, combined with an agitation for a gold standard there, must have an effect on the market. When the demand sets in India for crop-moving purposes in March and April, it is quite possible that country will draw considerable silver, which, if proven correct, will favorably affect the white metal.

MEXICAN DOLLARS.—The demand, as usual at this season, is slow, and liable to continue so for the next three months.

COPPER.—The output of this country in 1897 is placed at about 24,000,000 pounds over 1896. Notwithstanding this large increase in production the stocks held are not excessive, owing to the large increase in consumption abroad, and this, too, in the face of the engineers' strike in England. This shows that, while England's trade in this particular direction has suffered, the continent, particularly Germany, has been the gainer. With the strike now of the past, English requirements ought to enlarge, which will be still further influenced when India's new cereal crop season commences.

Our market is quoted as follows:

Ingot casting, jobbing	— @13
Ingot " wholesale	— @12½
Sheet copper	— @16½
Bolt ¾ and 5-16, 20c; ⅜ and larger, 16½	

TIN.—The market at the close is a shade easier for pig. For plate our market is quite irregular and hard to quote close. Imports the past week aggregate over 37,000 boxes from England. This, it is said, was placed to arrive.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

QUICKSILVER. — There is a light but steady demand.

Our market is quoted at $39 for domestic consumption and $35@36 for export to the west coast of Mexico.

LEAD.—The demand, as usual to the season, is light on this coast and in the East. No changes have been made in quotations, but it is understood concessions are obtainable in sympathy with easier markets at the East.

Pig	4 75	@	5 00
Sheet	....	@	6 50
Pipe	5 30	@	5 80

IRON.—The consumption of pig on this coast, particularly in this city, is in excess of the corresponding time in 1897. Imports the past week aggregate 300 tons pig from Philadelphia and 500 tons from New York. The East reports heavy exporting of pig, particularly Southern, while the home consumption shows a steady increase.

SHOT.—The market is easy at quotations.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 35
Drop, B and larger sizes, " "	1 60
Buck, Balls and Chilled, do, " "	1 60

COAL.—A private circular reports as follows: "A total of 5918 tons from Australia in thirty days means short stocks on hand here now, but this will be relieved this month, as we have thirteen vessels with 32,000 tons of Australian coal due here before March. The loading list at Newcastle and Sydney has been increased about 26,000 tons since last mail left (Jan. 6th); then the reported coal engagements footed up 70,000 tons capacity, now 96,000 tons. Of the thirty-nine vessels chartered, only sixteen have so far been loaded. High prices must assuredly rule the balance of this year, for all characters of fuel, as our northern mines will be strained to supply us locally, in addition to the calls which will be made on them to coal all the steamers that will be engaged in the Alaska trade. Jobbers have marked up all the grades of domestic fuel, as this character of coal is very scarce. Steam grades so far are not affected."

Receipts of coal for the week ending Tuesday were as follows, in tons: Departure Bay, 4728; Philadelphia, 1948; Nanaimo, 2310; Coquille river, 145; Puget Sound, 3500. Total, 9631 tons.

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

BORAX.—The market is firm.

demand ruling.

The market is quoted as follows:

Refined, in carload lots, in barrels	7
Refined, in carload lots in sacks	6¾
Powdered, in car lots	7
Concentrated, "	6½

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

ANTIMONY.—The market is steady.

POWDER.—The market is steady at current quotations.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17½c, according to strength and quantity; No. 2, from 9 to 11c, according to strength and quantity.

Chemicals.

Business continues to be confined to legitimate wants, with no change in quotations reported, and none looked for until chop lots in jobbers' hands have been exhausted. Our New York advices state that business is quiet, with no changes in quotations reported.

CYANIDE OF POTASSIUM.—The market is steady.

Our market is quoted for chemical pure 32 cents per pound for jobbing lots, and 29 cents for carloads.

SULPHURIC ACID.—The market is firm.

We quote in a jobbing way at 1¼c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6¼@7c per pound in carboys.

BONEASH.—There is a fair export movement.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

SODA ASH, 58% (LeBlanc process).—The market is steady at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market fluctuates for round lots, but is steady for small.

Our market is quoted from store at 4c for 95%.

PHOSPHORUS.—The market is steady.

We quote in a jobbing way at 70 to 75 cents per pound.

Mining Share Market.

SAN FRANCISCO, Feb. 3, 1898.

The market has been quite active throughout the week under the lead of Sierra Nevada. On last Thursday it sold at $1.10, then down to 75 cents, from there to $1.20, then back to 80 cents and again to $1.10. The lively fluctuations in Sierra Nevada cause lively comments on the street, but no one seems to know who is back of it, for the public is not in it. When Sierra Nevada moved up, the other shares sympathized slightly; but when it went back, the others struck a still lower level, some selling lower than for over a year. The decline of Sierra Nevada from $1.20 to 80 cents brought Con. Virginia down to 93 cents, which is the lowest figure, excepting in 1896, when it sold at 75 cents, at which it has sold for several years. Ophir sold down to 51 cents and Mexican to 21 cents. Chollar and Savage, in the middle, also touched low-water marks, as did some in the Gold Hill group. The ups and downs in Sierra Nevada are said to be based on running in and out of ore in the Reilly tunnel, but to an outsider it looks like manipulation to shake holders out of other shares, for traders will operate in the more active shares. There are mines on the Comstock where a much better showing has been made than is being done in Sierra Nevada, yet the shares hardly budged out of the regulation blackboard prices. While saying this, it must be admitted that the ground in which they are working in Sierra Nevada is of a most interesting character, and experienced miners contend they are liable to run into a large body of ore. The work in Chollar and Potosi seems to be laying the foundation for active exploiting in the mines. It suggests the possibility that several levels from the 1000-foot down to the Sutro tunnel level. If this should be done, it is thought the shares will show as much life and activity as Sierra Nevada displays. The work under way in three of the mines in the Gold Hill group points to more active exploiting in the spring, which, if done, will bring the shares in that group into play.

The news from the Comstock mines centers largely in Sierra Nevada, where they have struck fair grade ore, assaying about $18, in the Reilly tunnel at a depth of about 140 feet from the surface. The striking of this ore will unquestionably cause the starting of work lower down, so as to tap its downward continuation, but the level on which it is struck will be exploited to find its extent and value. In Utah they are driving ahead in the north drift. At last advices they were in soft porphyry showing vein matter and clay seams. In Sierra Nevada the Reilly tunnel is in 700 feet; at a distance of 663 feet in they struck ore going from $18 to $30 in gold. On the 900-foot level they are pushing ahead on No. 5 west crossdrift. They are in about 150 feet. In Union the work is confined to east crossdrift No. 2 on the 900-foot level. They are in about 175 feet. In Mexican east crossdrift on the 1000-foot level, about 230 feet from the Ophir line, is in about 675 feet. There is no change in the material. West crossdrift on the 1000-foot level of Ophir is in nearly 850 feet. The face is in porphyry showing clay and narrow seams of vein matter. West crossdrift on Central Tunnel level is in over 400 feet. The material is the same as found on the 1000-foot level.

In Con. Virginia the work is still confined to the 1550-foot, 1650-foot and 1750-foot levels. In an upraise from the 1650-foot level they cut small streaks of ore, from which fourteen tons were saved, assaying over $64 to the ton. The general character of the work and formation of ground in the mine do not show any change. The joint east crossdrift of Best & Belcher and Gould & Curry on the 900-foot Bonner shaft level is in over 650 feet. Nothing new is reported in the Savage letter. In Chollar the main airway on the 100-foot level has been repaired and is in good condition. They have put two sets of timber in the main incline above the 1000-foot level. Good progress is being made to connect the 1600-foot station with the Comstock tunnel. The joint work by Potosi and Bullion is confined to drifting south from the tunnel level in Potosi. The joint repairs to the Crœsus shaft are completed. They are crossdrifting east from the upraise above the tunnel level. The Alpha management forund a 5-cent assessment down here and $12 to $18 ore in the mine in an upraise from the 500-foot level. The surface tunnel in Con. Imperial is in over 475 feet. No change reported. The joint west crossdrift is in nearly 1800 feet. The flow of water is still quite strong. Nothing new comes from Challenge, Confidence or Yellow Jacket. In Crown Point they are raising low-grade ore from the 700-foot level to make a test run. Fair progress is being made in the joint Crown Point-Belcher upraise from the 850-foot level. Some fair grade ore is being extracted and raised by Belcher. No change is reported in Justice, Caledonia or Seg. Belcher since our last review.

In carrying out recent suggestions, the Savage-Hale & Norcross-Chollar-Potosi shaft No. 1 on the Brunswick lode will be sunk to the 800-foot level, so as to explore to the west at that depth. It is the belief of mining men that a body of ore will be struck on that level. The west workings in the other mines are being watched with interest, as is the south drift in Potosi, to see if recent deductions prove correct. The joint east crossdrift on the 600-foot level of Gould & Curry is being pushed slowly ahead. Fair progress is being made in the joint west crossdrift on the 600-foot Best & Belcher level. They are in now over 210 feet. In the west crossdrift 200-foot Chollar level bunches of quartz are run into. They are crossdrifting to the west on the 500 foot level. The formation is unchanged. On the 3000-foot level they are saving each day a few tons of fair ore. They are pushing ahead in Potosi the south drift on the 600-foot level. Low grade ore is being encountered. In Occidental they are crossdrifting on the 550-foot level and also on the 650-foot level. In the latter the material is soft and shows proximity to the east ledge. On the 750-foot level they have extended the main south drift 700 feet. The face is in fair grade ore. At the end of the drift they are sinking on ore assaying about $56 to the ton.

The following illustrates the changes of the week:

Mines.	Jan. 20.	Feb. 3.

Assessment Notices.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 3rd day of January 1898 an assessment (No. 12) of 5 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin to the secretary at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

THE SAVAGE MINING COMPANY.—LOCATION of principal place of business San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 6th day of January, 1898, an assessment (No. 94) of 20 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of February, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. B. HOLMES, Secretary.

Office—Room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

FALL RIVER CONSOLIDATED GOLD QUARTZ Company.—Location of principal place of business, San Francisco, California; location of works, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 15th day of January, 1898, an assessment (No. 11) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 313-315 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of February, 1898, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on THURSDAY, the 21st day of April, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. LORSBACH, Secretary.

Office—313-315 Front street, San Francisco, California.

THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of January, 1898, an assessment (No. 9) of 2½ cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 44, Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of February, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary.

Office—Room 44, Phelan building, San Francisco, California.

BALIOL GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1898, an assessment (No. 2) of 30 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of March, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. CHENEY, Secretary.

Office—Mills building, room 7, fifth floor, San Francisco, California.

THE ORLEANS MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Grass Valley Mining District, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of February, 1898, an assessment (No. 7, new series) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 575 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of March, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of March, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. O. THURSTON, Secretary.

Office—No. 575 Mission street, San Francisco, California.

MINING RIGHTS

—IN THE—

Western States and Territories.

By R. S. Morrison and E. D. DeSoto. Ninth edition; revised and enlarged; 497 pages, 16mo. Price, postpaid, $3.00. The BANCROFT-WHITNEY CO., successors to the Chain & Hardy Co., Denver, Colo.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from O. M. Henry, in the Murphy Diggings, near Volcano, Amador Co., to deposit tailings in Rancheria Creek; from Geo. A. Hamilton, in the Clapboard Gulch Mine, near Volcano, Amador Co., to deposit tailings in Sutter Creek; from Frank J. Goyan, in the Cox Mine, near Plymouth, El Dorado Co., to deposit tailings in a ravine; from J. M. Longnecker, in the Hull Placer Mine, near Genesee, Plumas Co., to deposit tailings in a ravine; and from E. Becker and Robert Hickey, in the Homestake Mine, near Amador City, Amador Co., to deposit tailings in Rancheria Creek, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on February 7, 1898, at 1:30 P. M.

DELINQUENT SALE NOTICE.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Humboldt County, California.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 2) levied on the 25th day of November, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Harvey M. Binckley	2	1	5 00
Alice E. Binckley	20	4	20 00
Alice E. Binckley	23	20	100 00
Alice E. Binckley	24	20	100 00
Alice E. Binckley	25	20	100 00
Alice E. Binckley	26	20	100 00
Alice E. Binckley	39	1	5 00
Alice E. Binckley	40	2	10 00
Caroline S. Townsend	18	20	100 00

And in accordance with law, and an order from the Board of Directors, made on the 29th day of November, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the corporation, 125 Beale street, San Francisco, California, on SATURDAY, the 29th day of January, 1898, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

H. H. MARTIN, Secretary.

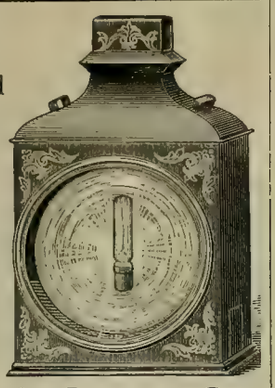
Office—125 Beale street, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors the day of sale of the above delinquent stock has been postponed to SATURDAY, February 26th, 1898, at the same hour and place.

H. H. MARTIN, Secretary.

Office—125 Beale street, San Francisco, California.



DIVIDEND NOTICE.

JAMISON MINING COMPANY, Rooms 50 and 54, 120 Sutter St., San Francisco, Cal., January 25th, 1898.

DIVIDEND NUMBER ONE.—At their meeting of January 25th, 1898, it was resolved by the Board of Directors of the Jamison Mining Company to pay to the Stockholders of the Company from the surplus funds in the treasury, a dividend of Nineteen Thousand Five Hundred Dollars ($19,500), being Five Cents (5 cts.) per share on the capital stock of the Company. The dividend will be payable at the office of the Company on the Fifteenth (15th) day of February, 1898, to all stockholders of record on the Fifth (5th) day of February, 1898. Transfer books will be closed at the close of business on the 5th of February and reopened on the morning of February 16, 1898.

Extracts from Letters Received from Mr. Philip Hall, Manager the Metallic Extraction Co., Cyanide, Colo.:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 100 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The **ROPP FURNACE** is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Ore Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

AND PACIFIC ELECTRICAL REVIEW.

No. 1962.—VOLUME LXXVI. Number 7. SAN FRANCISCO, SATURDAY, FEBRUARY 12, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Jamison Mining Company.

The property of the above company is in Quartz township, Plumas county, Cal., and consists of 590 acres—430 acres held under patent as quartz and placer claims, and 160 by location as a placer claim. The property adjoins the old and famous Plumas Eureka property of the Sierra Buttes Mining Company, Jamison creek being in a general way the dividing boundary between the two properties. There is an excellent water power belonging to the company. This consists of four lakes, at an altitude varying from 6000 to 7000 feet, and all naturally discharging through one small lake. All of these lakes have been dammed, the main reservoir dam being at the lake through which the others discharge. From there a ditch 1½ miles long carries a large head of water to the pipe line, which discharges at the hoist under a head of 460 feet and at the mill under a head of 525 feet. In all, seven water wheels are used—running the hoist, compressor, mill, electric light dynamo, rock crusher and a train of light shafting, carrying circular saw, drill press, grindstone, etc. The mine is opened by means of a drain tunnel at the lowest practicable level, but this tunnel (and the levels above it) are connected with the surface by a vertical shaft, and everything, waste and ore, is hoisted to the surface through this shaft, it being found cheaper, with the free water power, to hoist than to tram out the length of the long drain tunnel (about 1700 feet from the shaft to the outlet).

PLANT OF THE JAMISON MINING CO., JOHNSVILLE, PLUMAS COUNTY, CAL.

A 10-stamp mill began operation December 26th, 1896. In June, 1897, the erection of ten additional stamps was begun, and the twenty stamps dropped on ore August 26th, 1897. Since then these twenty stamps have run continuously. During the latter four months three 6-foot concentrators were added to the mill, which are found sufficient to handle the tailings. The capacity of the mill is not great, although the stamps are of the most modern description and heavy (one battery being about 900 and the other 975 pounds), owing to the clayey character of the ore. The best monthly capacity obtained from the twenty stamps has been about 1400 tons, crushing through a 40-mesh wire or a No. 0 punched tin screen. During the four months from August 26th, 1897, to December 26th, 1897, the twenty stamps crushed 4917 tons of quartz. The total expense of handling this ore was $12,096.65—$2.46 per ton. This includes everything, office expenses, taxes, insurance, etc. The division of this expense is: Mining, $1.423 per ton; milling, $0.568 per ton; general expense and superintendence, $0.300 per ton; maintenance, repairs and sundry expenses, $0.114 per ton; San Francisco office expense, $0.055 per ton.

The ore worked at present averages an extraction in free gold of from $4.25 to $4.75 per ton. The tailings from the plates run from $1.40 to $1.80 per ton. Of this, about 50 to 80 cents per ton is recovered by the concentrators. The tailings from the concentrators at present going to waste assay about $1 per ton. The company owning this property is organized under the laws of this State, with its principal place of business in San Francisco. A majority of the stock is owned by residents of Pennsylvania and Connecticut. The management of the property, since serious work on it was begun, has been in the hands of Sam. W. Cheyney of San Francisco, assisted for some time past by Geo. S. Redstreake.

The output of the property during 1897 was somewhat in excess of $60,000, the profits for the same period over and above current expenses being about $25,000.

The following will be interesting to miners as showing the relative cost in this case of running ten stamps and twenty stamps:

COMPARISON OF CURRENT COSTS PER TON, OPERATING WITH TEN STAMPS AND OPERATING WITH TWENTY STAMPS.

TEN STAMPS' RUN—FROM JANUARY 1ST TO AUGUST 31ST, 1897. MILLED 5,589 TONS OF QUARTZ.

Current Expenses.		*Per Ton.*
Mining	$13,145 67	$2 352
Milling	4,626 57	0 828
General expense and superintendence	3,249 17	0 581
Maintenance, repairs and sundry expenses	569 82	0 102
Total expense at mine	$21,591 23	$3 863
Add San Francisco office expense	$1,154 70	
Taxes for eight months	112 67	
	1,267 37	0 227
Total cost per ton, ten stamps		$4 09

TWENTY STAMPS' RUN—FROM SEPTEMBER 1ST TO DECEMBER 31ST, 1897. MILLED 4,917 TONS OF QUARTZ.

Current Expenses.		*Per Ton.*
Mining	$ 6,994 51	$1 423
Milling	2,792 17	0 568
General expense and superintendence	1,478 44	0 300
Maintenance, repairs and sundry expenses	561 20	0 114
Total expense at mine	$11,826 32	$2 405
Add San Francisco office expense	$ 214 00	
Taxes for four months	56 33	
	270 33	0 055
Total cost per ton, twenty stamps		$2 46

This may be styled a typical California mining company—nothing very extensive, but deemed worthy of notice as fairly illustrative of what may be considered a legitimate mining proposition. It has been stated in these columns on several occasions that gold ore in this State is being mined and milled at a total cost of less than 60 cents per ton, which is a fact—but, it must be said, under exceptional conditions. The Jamison Company, to which reference is herein made, does not operate under such favorable auspices; yet it is cited as an exponent of what may be said to be a fair example of the workings of a California gold mine. There are hundreds of such properties in this State—some doing better, some perhaps, not doing so well.

The point deemed worthy of mention is the fact that this business of gold mining is more than ordinarily profitable. Here we have a going concern which has cost $150,000. During the past year it cost $60,000 to run it, and on this basis has paid a clear profit of $25,000, being 16⅔ per cent on the investment. Keeping out of consideration the fact that there are a great many mining properties in California doing better, yet it is believed that the contrast between this and other forms of business strikingly illustrates the profitable character of such work when entirely separated from its speculative aspect. This exemplifies California's greatest industry, which is in direct contrast to the greatest industry of New England, which is the manufacture of cotton fabrics, and where, so the papers tell us, now exist hard times, prices below cost, mills running on short time, stocks accumulating in the warehouses, and refusing to move goods at prices that will return a new dollar for an old one, a cut in wages, strikes, suffering, misery, destitution, and all the untoward accompaniments of such a deplorable state of affairs.

The owners of the New England mills would be pleased with a profit of 3 per cent. They have to watch markets and cut everything down to the quick, reduce expenses, stop operations, compete with jealous rivals, while the California gold miner knows that in place of having to strike a customer the customer is after him, and that, whether he produces 100 ounces or 1,000,000 ounces, he is sure of getting $20.67 for every ounce of it; and he cares little whether Colorado, Utah, Montana or any other State produces as much or more gold than he, as there is a constant demand for all the gold that can be produced at a fixed price. Gold is the one present product of man's labor which cannot be controlled in output nor have its value determined according to the laws of supply and demand that control every other product.

Four Thousand Words a Minute; The Divining Rod; Californian Pine Products; Plumbago as a Lubricant for Machinery; Chemically Pure Iron; Too Truthful to Be Pleasant; Universal Solvent of the Alchemists; "Rare Earths;" Expert on Gas Engine Matters; Value of Machinery and Instruments During '97, 184. A Great Event; Another Reminiscence; The Kern Co., Cal., Electric Plant; Mine Sinking Pump; Useful Aspect of Earthquake Observations; Influence of Magnetism; A True Floating Dock; Coast Industrial Notes; Personal; Recent California Mining Incorporations; Recently Declared Mining Dividends; Obituary, 185. Book Notices; Commercial Paragraphs; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 186.

PROMINENT among the county exhibits at the Golden Jubilee Mining Fair are those of Placer and El Dorado counties.

EXACT statistics of the gold production for '97 of California and Colorado have not yet been received, though it is apparent that our sister State will crowd California pretty close for first place as a present gold producer.

"ON TO THE KLONDIKE" has taken the form of a stampede. Hundreds are now leaving San Francisco and other coast ports, lured by the reports from that region. Just what the majority of them propose to do when they get there is a problem. The whole thing is a fever that must run its course, and it is to be hoped that most of the sufferers will be discharged cured.

AUSTRALIA'S gold yield for '97 was something phenomenal—almost equaling that of the United States. About 25% of the amount has been received in San Francisco during the past few months to settle the balance of trade in favor of this country. The £515,857, equal to $2,510,160, on the steamship Mariposa yesterday brings the total shipment of Australian gold to California for the season up to $13,000,000.

THE MINING AND SCIENTIFIC PRESS is appealed to as to whether the Klondike placers are richer than those of California were. Exact data shows that the most extravagant stories as to the yield and richness of Klondike placers are discounted and overshadowed by the actual record of the yield of California's placer mines. J. Ross Browne's "Report to the Government on the Mineral Resources of the Pacific States," in 1867, a sober, authentic official report from a conservative mining expert and statistician, shows that nothing yet reported from the Yukon region exceeds, or more than approximates, the richness of the early California placers. Much of what is reported from the Yukon is idle hearsay or emanates from the transportation companies. What is set down in the Government report referred to is not conjecture nor stated to influence travel, but is an authentic record of fact. There are many trustworthy records of the almost incredible yield of California's placers, but the above is referred to as being in the writer's remembrance. For instance, the Rhodes claim, near Murphys, Calaveras Co., produced $250,000 from an area 100 feet long and 40 wide; ninety pounds of gold were taken out in twenty-four hours. The Jamieson claim, Iowa Hill, Placer Co., yielded $500,000; the Dardanelles, Forest Hill, in the same county, $2,000,000; near Springfield, Tuolumne Co., single carloads of "pay dirt" panned out $1000 each. Butte, Yuba, Nevada and other counties have equally as good records. In the case of California it is not what its placers are "going" to yield that is the subject, but what has gone to swell the world's store of gold.

"Unawed by Influence and Unbribed by Gain."

In the issue of the 8th ult., commenting on one of those ridiculous romances called a "mining prospectus" issued by a London company to float a California gold property, the editorial statement was made that that prospectus "is appearing as a page advertisement in every English newspaper that is feared." Some objection has been received from severely virtuous critics, who solemnly protest against the implication that any part of the British press can be influenced by sordid motives. This paper can usually prove what it asserts; in this case the fact that some of the British press is purchasable is so notorious as to need no proof. It is an acknowledged fact, unquestioned except by those who pretend ignorance of it. There are British editors who have the same rule as that which governs the management of this paper, viz., that neither money nor influence can put anything in or keep anything out of its columns. Prominent among these unpurchasable men is Labouchere, the editor of *Truth*. On this very subject, for casual reference to which Pharisaical critics undertake to censure this paper, Labouchere in his fearless paper, published in London, says editorially:

I am told by a gentleman who speaks with some authority that there are about twenty newspapers in London alone which have to be "squared" with advertisements whenever a new company is floated, under threats of hostile criticism unless this precaution is adopted. The author of this statement does not offer me any evidence so far as London is concerned, but he forwards some instructive correspondence between the directors of a new company and a newspaper published at Perth.

The correspondence is opened by the editor of the paper, who writes to the managing director to say that he received an important letter challenging the statements in the company's prospectus, and generally making unfavorable observations upon the enterprise.

"If we publish this letter on Monday," he says, "you need not look for any Scotch applications for stock. That is clear."

He goes on to say that there is plenty of time for the company to wire if "they have anything to say," and that "it might be possible to allow the letter to stand over a few days until the charges have been verified," but that the letter will "be published if we do not hear from you by Monday afternoon." Then comes this very significant paragraph: "Also please say if we shall insert the prospectus on Monday."

The directors sent their prospectus for insertion as an advertisement, and at the same time, strange to relate, the significance of the "important letter" so far evaporated that in the next communication the editor states: "We have held over the letter to which we called your attention—in fact we do not think we will insert it at all."

How surprised our critics will be to learn that there is such a man as the editor of the newspaper referred to in Perth!

NOTICEABLE at the Golden Jubilee Mining Fair now in progress at Mechanics' Pavilion in San Francisco, is the unostentatious, matter-of-course manner in which casual evidence is given mineral wealth. In the display of the Selby Smelting and Lead Company of San Francisco, for instance, is a large gilded block on which is inscribed the brief statement that that represents the size of the refined gold product of that concern for the year 1897, value $19,600,000. Nothing is said of the silver, copper, etc., merely the gold, and no especial wonder is made of that; nearly $20,000,000 in fine gold in that one establishment in a year. In a modest little corner of the State Mining Bureau exhibit is a reproduction in size and appearance of a bar of gold, the product of one clean-up of the North Bloomfield mine, with the simple announcement in small letters on a little card of the fact and the statement that it was of the value of $114,000. On the ground floor, among the gold exhibits, are gold bricks of the value of $22,000 each. There is no attempt at special prominence in any of these exhibits. Like the climate or the facilities of operation, these things in California are taken as matters of course. Many of the mines from which this gold came can be reached in a palace car from San Francisco, and work thereon can be done any and every day in the year. Were it to require a vexatious and expensive journey, full of hardships and privations, accompanied with appalling danger and possible death in a region of eternal ice and semi-night, these would be great things; but in this favored land they are of little wonder to those familiar with them. It is in order, and should be provided for, to send the major part of the exhibit of gold and ores, etc., now in this city, to the Omaha Exposition next summer; thence to New York City, then to Paris in 1900. Every thousand dollars so expended would bring back a million dollars to the State and the coast. This is the age of advertising, whether it be food, mining machinery, mines, or anything else. California's nuts, oranges, grapes, wines, etc., have been well advertised during recent years; but until lately there has been but little effort to have California's mineral wealth understood abroad. Californians go largely on the assumption that, as they know about it and appreciate it, why of course the world must know it, too. Without the slightest bombast or efforts to boom, a modest exhibition of exact facts wherever large numbers of people congregate would be a good advertisement for the mineral resources of this commonwealth.

AN editorial in the issue of December 25th, '97, entitled "The Modern Alchemists," has elicited a more than ordinarily large number of comments, and the editorial office could supply sufficient material for one issue, to the exclusion of everything else, were a portion of the received manuscripts on that subject published. The letters received, taking that editorial as a text, illustrate forcibly two things: First, the interest evinced in the alleged manufacture of gold, which is not surprising; and, second, the surprising evasion or forgetfulness of the main point exhibited by many of the letter writers in assuming that the question at issue is the sincerity of the alleged gold manufacturers. No one doubts the sincerity of their convictions; but there is something more required than merely sincerity or honesty of purpose. Probably none are more sincere than the gentleman in the insane asylum at Stockton who imagines himself the owner of the State, or the wave motor man who seeks to ignore the law that action and reaction are equal. These people are as honest in their beliefs and as sincere in their convictions as the gentlemen who assert their ability to manufacture gold at will from silver, iron, sulphur, etc. The touchstone of all these things is success. The world doesn't care particularly by what means success is attained. The article to which these numerous replies have been received did not impugn the honesty or sincerity of the devotees of the new-old science of alchemy. On the contrary, it asserted in the most positive terms its belief that they were sincere. The whole matter is one that does not require, nor, indeed, admit of, argument. These gold manufacturers make certain claims, and it would seem as though the result would demonstrate the accuracy or absurdity of their statements. It is unnecessary to attempt any discussion, for if they can do what they claim, such result would be the best commendation of their theories. They all assume a disregard for ordinary curiosity, which is the main impulse of the public mind. As in religion people prefer to be amused rather than admonished, so in science the general public prefers to have its curiosity excited rather than to be instructed. In common with other things, this matter possesses some interest to the public, and will doubtless be discussed by lofty minds in after ages, when all now living, like streaks of morning cloud, shall have melted into the illimitable azure of eternity.

IN the issue of Dec. 25th, '97, as it left our mailing office was folded in each copy a fine map of the Klondike and Yukon region, and a brief announcement was made of the fact. Many of our subscribers, for some reason, did not find this map in their copies as received, and so notify us. In all cases of such notification an additional map has been sent, and if those who were equally unfortunate in this regard will send a postal to the business office, stating the fact, a copy of the map will be sent to the designated address.

Useful Hydraulic Data.

Written for the MINING AND SCIENTIFIC PRESS by JNO. W. GRAY.

The following information (somewhat condensed) is taken from a paper published in the New Zealand Mines' report, and written by Mr. Alex. Aitken, manager of the Government water races at Kumara, the largest hydraulic sluicing gold field in New Zealand. The matter given is instructive and will prove of value to those engaged in hydraulic mining, or using water for power and other purposes.

Experiments were carried out to verify the rules and data given, which are simple and easily understood. During a professional visit to New Zealand last year I saw much to interest me in the hydraulic sluicing regions of the West Coast, and the data copied from Mr. Aitken's paper will no doubt prove of interest to many, as showing how matters connected with the practical working of the mines are there determined.

Power of Water.—A sluice head of water is a constant flow of 1 cubic foot per second, equal to 40 miners' inches of 1.5 cubic feet per minute. The following method of estimating the practical horse power of water is based on the fact that one sluice head of water falling 8.8 feet is equal to one theoretical horse power.

TABLE No. 1.

PERCENTAGE OF THEORETICAL HORSE POWER REALIZED BY VARIOUS MOTORS.

Undershot wheels	30% to 35%
Low-breast wheels	50% to 55%
High-breast wheels	55% to 60%
Overshot wheels	60% to 65%
Turbine wheels	60% to 70%
Pelton wheels	80% to 90%
Water pressure engines	70% to 80%

In the above table the percentage of the power developed has been ascertained by actual experiments and varies within the limits given, according to manner of construction. To obtain highest efficiencies, motors should be properly suited to water used. The manner in which water is applied, and the regulation of proper speed, are of the utmost importance. The correct speed of a Pelton wheel is one-half the speed of water issuing from the nozzle. The high efficiency of this wheel is due to the perfect manner of reversing the direction of the water discharged upon it.

The following table gives the hydraulic head necessary to obtain one effective horse power from one sluice head of water. The hydraulic head is the total vertical height of supply, after making deductions for losses by friction and other retarding forces. To use the table, multiply sluice heads of water by the hydraulic head and divide by the number in "division" column opposite the given efficiency:

TABLE No. 2.

DIVISIONS OF HYDRAULIC HEAD FOR ASCERTAINING EFFECTIVE HORSE POWER PER SLUICE HEAD OF WATER.

(Calculated from $\frac{8.8}{\text{percentage}}$ = head required per horse power.)

Efficiency of motor—Per cent.	Division.	Efficiency of motor—Per cent.	Division	Efficiency of motor—Per cent.	Division.
100	8.800	76	11.578	52	16.923

88	10.000	64	13.750	40	22.000
87	10.115	63	13.968	39	22.564
86	10.232	62	14.193	38	23.157
85	10.352	61	14.426	37	23.783
84	10.476	60	14.666	36	24.444
83	10.602	59	14.915	35	25.142
82	10.731	58	15.172	34	25.882
81	10.864	57	15.438	33	26.666
80	11.000	56	15.714	32	27.500
79	11.139	55	16.000	31	28.387
78	11.282	54	16.296	30	29.333
77	11.482	53	16.603		

Example.—Determine the actual H. P. given by a low-breast wheel, efficiency 55%, with 33⅓ sluice heads of water, and 10 feet hydraulic head: $\frac{33\frac{1}{3}\times 10}{16}$ = 20.8 H. P.

If the pipes are large enough to convey the water at a velocity not greater than one foot per second, and length of pipe line is not great, no allowance for friction is necessary, and the total head may be taken as the hydraulic head. If the pipes are small, and the velocity of water greater, proper allowance must be made for friction. For determining loss by friction, see instructions and table given below.

Pipes conveying water for power cannot be too large; the limit is simply practicability and cost. With small pipes and long lines, much of the total head is absorbed by friction and lost.

Friction of Water in Pipes and Channels.—The hydraulic mean depth is the sectional area multiplied by the wetted border. Experiments show that the forces retarding the flow of water in pipes and channels, generally termed "friction," are, in pipes and channels of the same character and of equal hydraulic mean depth, proportional to the square of the velocity of the water; but where the H. M. D. is greater, the loss of head by friction is less for any specified velocity.

In the flow of water through pipes and channels, a portion of the head is absorbed in producing the velocity; another portion is absorbed by friction proper and another portion (in many instances very large) is absorbed by eddies and counter currents, caused by obstructions, inequalities and roughness in the pipe or channel. The last-named loss of head may be seen by observing the flow of water in an unlined tunnel or open ditch, with sets of timbers every three or four feet. Experiment has shown that such a tunnel or channel may be made to carry double the quantity of water if smoothly and uniformly lined. A change in the form of sectional area of flowing water produces retardation.

There are several methods for ascertaining the loss by friction (which term is taken to include all the retarding forces) in pipes of various diameters, and carrying water at various velocities. A pressure gauge may be used at any point in a line of pipes, and the difference between the reading when the water is at rest and when the water is in motion delivering a certain quantity of water (the pipes being full in both instances) is the exact measure of the loss of head that takes place between the source and the point at which the gauge is used.

Another method quite as reliable is the calculation of the loss of head from the carrying capacity of pipes of various diameters under various hydraulic gradients. If a pipe of a specified diameter (or H. M. D.) carries a certain quantity of water on a certain gradient, then that gradient is the correct measure of the loss of head of that pipe when carrying that quantity of water. If a pipe carries four sluice heads of water on a grade of 1 in 100, then the loss of head in that pipe, carrying that quantity of water, will be 1 foot for every 100 feet of length. Therefore, a formula for ascertaining the carrying capacity of pipes of various diameters under various gradients can, by transportation, be made to give the correct loss of head by friction.

Table number four below gives the results of experiments made to ascertain which formula in general use gives the most correct results. It will be seen that Eytelwein's general formula is not only the most correct but by far the most simple, and is applicable not only to pipes but to channels as well. The formula is: "The mean velocity of water in feet per second is equal to the square root of" (twice the fall in feet per mile multiplied by the hydraulic mean depth). This formula may be stated as $\sqrt{R. S. 10560}$ = velocity, R being the hydraulic mean depth and S the sine of inclination, S10560 being equal to twice the fall in feet per mile. The formula is correct only for long, straight and smooth pipes and channels, but it gives correct proportions for pipes or channels of any kind—crooked or straight, rough or smooth—and the results, multiplied by suitable coefficients, give ultimate results quite as correct as the more complex methods of calculation.

TABLE No. 3.

Table No. 3 is founded on Eytelwein's formula. It gives the length of pipe in which 1 foot of head is absorbed by friction in clean pipes from 6 inches to 36 inches in diameter, when carrying from one to fifteen sluice heads of water. To use the table, divide the total given length of pipe by the length in the table corresponding to loss of 1 foot of head; the answer is in feet.

If the quantity of water intended to be used is more than fifteen sluice heads, take from the table the number corresponding to one-half, one-third or one-fourth the intended quantity and divide by 4, 9 or 16, respectively; or, use the formula as given at head of table.

When the pipes are slightly rough, add 30 per cent. When pipes are very rough and badly laid, add 60 per cent.

Calculation of the Carrying Capacity of Open Channels, Tunnels and Flumes, by Eytelwein's General Formula.—Mean velocity of water, in feet per second, equals the square root of twice the fall in feet per mile multiplied by the hydraulic mean depth. Velocity multiplied by area equals quantity. Hydraulic mean depth is the sectional area divided by wetted border. Area is mean width of flowing water multiplied by depth. Wetted border for plumb or sloping sides is found as follows:

Plumb Sides	Depth × 2 + width of bottom.
¼ to 1 "	Depth × 2.0615 + width of bottom.
½ to 1 "	Depth × 2.236 + " " "
1 to 1 "	Depth × 2.828 + " " "

The number of cubic feet per second (or sluice-heads) of water which such a channel will carry, if long, straight and smooth, is given by the formula or rule, but for other kinds of channels, as a crooked or rough ditch or tunnel through boulders and stones, or with sets of timber every 3 or 4 feet, the result must be multiplied by a coefficient suitable to the character of the channel. The following table of coefficients is deduced from a large number of experiments, extending over a period of twenty-five years:

Iron fluming, straight and smooth	1.0
Iron fluming, moderately straight and smooth	0.9
Flumes and tunnels, straight and lined with dressed boards	0.8
Flumes and tunnels, straight and lined with sawn boards	0.7
Clay, smooth and moderately straight	0.6
Gravel, moderately rough, with easy curves	0.5
Boulders, or with sets of timber and bad curves	0.4

This is for long lengths, or lengths sufficient to allow the flowing water to acquire its proper train. Short lengths of fluming between tunnels or ditching should in all cases have the same sectional area, and, as near as possible, the same form of flowing water as the tunnels or ditching, and the same gradient. All changes in the form of sectional area of flowing water should be made gradually.

Example.—What quantity of water will a channel in moderately rough gravel with easy curves carry, with sides slopes ½ to 1, 6 feet in width of bottom, 3

feet depth of water, and a gradient of 4 feet per mile? $(3 \times 2.0615) = (6.1845) + 6 = 12.1845$ wetted border.

$$\frac{6 + 7.5}{2} = 6.75 = \text{mean width.}$$

$$6.75 \times 3 = 20.25 = \text{area.}$$

$$\frac{20.25}{12.1845} = 1.6619 \text{ hydraulic mean depth.}$$

$\sqrt{8 \times 1.6619} = 3.646 =$ vel., if feet, per second.
$3.646 \times 20.25 \times 0.5 = 36.91$ sluice-heads of water.

Answer: In flumes, tunnels and channels of similar character, four times the gradient doubles the velocity or quantity, and four times the hydraulic mean depth also doubles the velocity or quantity.

Velocity is proportional to square root of gradient.
" " " " " " " H.M.D.
Velocity is proportional to square root of gradient × H.M.D.

Hydraulic Sluicing: Capacity of Sluices.—In sluices of similar as well as in other channels the velocity of water is proportional to the square root of the hydraulic mean depth multiplied by the gradient. In sluicing at Kumara the widths of the boxes are so regulated in properly worked claims that there is but little variation in the H. M. D. Therefore, in the calculation of the velocity of the water in the sluices at Kumara, or at other places having similar wash, the hydraulic mean depth need not be considered, and the velocity of the water may be stated as proportional to the root of the gradient. As the power (or force) of water is proportional to the quantity (or weight) of the water multiplied by the square of the velocity, and as velocity is proportional to the square root of the gradient, it follows that the power of water is directly proportional to the quantity of water multiplied by the gradient. This is only a modification of the well-known laws of water—the velocity of water is proportional to the square root of the hydraulic head, and the power of water is directly proportional to the quantity of water multiplied by the hydraulic head.

Experiments have shown these laws to be applicable also to gradients of sluices and other open channels; and as the velocity of water from nozzles is proportional to the square root of the hydraulic heads, so velocity of water in sluices having uniform hydraulic mean depth is proportional to the square root of the gradients.

The following rule has been checked by experiments and measurements made at Kumara. The rule gives the quantity (in cubic yards) of ordinary wash sluiced away per hour, in ordinary sluice boxes, paved with wood, with various quantities of water on various gradients. The rule is: The quantity of water in sluice heads multiplied by the fall in inches per box of 12 feet gives the number of cubic yards sluiced away per hour. Example—Ten sluice heads × 6 inches fall per box = 60 yards, the quantity sluiced away per hour. Number of cubic yards per hour required to be sluiced away, divided by the fall per box, gives the quantity of water required for that purpose. The number of cubic yards per hour required to be sluiced away, divided by the number of sluice heads available, gives the required fall per box.

The rule gives close approximate results, provided a proper use is made of the water, and the width of box is in proportion to fall and quantity of water.

The nature of the material to be sluiced must be considered. With material of high specific gravity and large quantities of spawled stones, the quantity put through will be less. With material of low specific gravity, and well-rounded stones, from 6 to 18 inches diameter, the quantity put through will be more. Wash is more easily sluiced when it contains a fair proportion of well-rounded stones. Fine, heavy wash is the most difficult; the stones keep the finer and heavier material from settling.

All the blockages at Kumara are composed of fine, heavy sand, and are seldom or never due to stones. All the material in sluices should be constantly on the move, otherwise blockages will occur, less material will be sluiced away and gold will be lost. As the parties running tailings into the main tail-races or sludge channels at Kumara have to pay a fixed price per shift of three hours for maintenance and repairs, means were devised for regulating the quantity of tailings sluiced by each party into the main sludge channel. As the price per shift was equal, each party was allowed to sluice an equal number of yards into the main tail-race. A table was prepared for the purpose. The table was calculated so that each party would sluice into the main tail-race sixty-four yards per hour, thus equalizing wear and tear and giving each party equal advantage of the flush water, which was supplied free. The table was calculated from the rule: "The number of cubic yards per hour required to be sluiced away, divided by the fall per box in inches, gives the quantity of water required for the purpose. Fall to be reckoned from the total difference of level in 60 lineal feet of tail-race, running full. The rule has been in force for some years and has given general satisfaction. It is in accordance with American authorities on the subject, and produces practically the same results as more complicated methods of calculation.

The regulations for main tail-race, Channel No. 4, are based on each party sluicing in 112 cubic yards of tailings per hour, and the quantity of water is calculated in the same way.

Example.—Water required to sluice into main tail-race 112 cubic yards of material per hour, with fall per box of 7 inches: $\frac{112}{7} = 16$ sluice heads = quantity of water required.

LIST OF CLAIMS AT PRESENT SLUICING ON THE KUMARA GOLD FIELD, SHOWING WIDTH OF BOXES, FALL PER BOX, QUANTITIES OF WATER USED, AND REMARKS ON WORKING.

Number of claims.	Width of box—Inches.	Fall per box—Inches	Quantity of water—Sluice heads.	Remarks.
1	32	4	20	Works well.
1	30	4½	20	Not straight; bad.
1	26	5	12	Fair.
1	22	5	12	Fair.
2	26	6	10	Fair.
2	22	6	10	Fair.
1	22	6½	10	Fair.
1	26	6¾	24	Too narrow.
1	24	7	14	Too narrow.
1	22	7	8	Good.
2	24	8	14	Too narrow.
3	24	8	10	Very good.
2	22	8	8	Fair.
1	22	8	10	Good.
1	20	8	10	Good.
1	20	8	8	Fair.
1	26	9	12	Good.
1	24	10	10	Good.
1	30	12	10	Good.

The total length of private tail-races in use at Kumara is more than seven miles, and quite double that length are now abandoned, as the ground commanded by them has been worked out. Main tail-races in use have a length of about three miles.

Wear of Wood (on End) Blocks.—Red pine (Rimu), being the most plentiful timber in the neighborhood of Kumara, is generally used for paving blocks. Other timber is, however, often used, and white pine will stand longer than red pine,

The following rule gives the life of the wood paving blocks nearly right: The width of the sluice in inches multiplied by the thickness of the blocks in inches multiplied by 320 gives the number of cubic yards of wash that will pass through the sluice before the blocks are worn out.

The Witwatersrand Banket, With Notes on Other Gold-Bearing Pudding Stones.*

NUMBER IV.

By GEO. F. BECKER.

The famous auriferous Tertiary gravels of California would scarcely be called gravels elsewhere. The pebbles are for the most part as large as cobble-stones, and a good proportion of them reach the size of the largest watermelons. Even the recent stream gravels, such as are being worked in Alaska, are very coarse and much of the material is no smaller than cocoanuts. The great gold-bearing channels in California are not usually over a mile in width, though occasionally they extend to two miles, but only a small part of such masses carries any large quantity of gold per ton. They are worked in part by hydraulicking, the cheapest of processes, and in part by drifting. A drift mine can not be run considerably under $1 per cubic yard, or say 2 shillings per ton. Now, in these great river channels the only portion which will pay for drifting is almost invariably the center of the channel on the bedrock. As a rule, the width of the channel which will pay for drifting is not over 200 feet, although in exceptional cases it extends to 400 feet. Much of the gold in these channels is coarse and nuggets are frequent. Could anything be more unlike the conditions on the Rand, where there is no real bedrock above the Swasi schists, no single surface along which the gold has accumulated, no conglomerate in the Main Reef series with pebbles larger than a goose egg, where there are no nuggets, and where the remunerative ore is known, by actual exploration, to be fairly uniform for a width of some 6000 feet? It may, indeed, be said that richer gravels than those of California might exist. If they did, most of the gold would still be found near the center of the channel and at bedrock, partly in the shape of nuggets, and they would merely resemble the richer portions of the Tertiary river beds of the Sierra Nevada.

The hypothesis of a lacustrine origin for the Lower Cape formation seems to me as untenable as the fluvial suggestion. Lakes are characteristically quiet sheets of water, from which sediments scarcely escape; in fact, they may be called Nature's "slime ponds." Lake beds are usually composed in great part of excessively fine silt, quite comparable to mill slimes. Such beds are not, however, composed exclusively of fine sediments; violent showers, landslides, glaciers, volcanoes and dynamic disturbances introduce coarse material into lakes, which, when worked over, produce fresh-water conglomerates. But these are always, so far as I know, associated with the peculiar fine sediments which are the direct evidence of the absence of strong, persistent currents in the body of water where sedimentation went on. Nothing of this kind is observable on the Rand; on the contrary, a vast proportion of the rocks was originally either conglomerates or sands as coarse and clean as are now formed off shores along which rapid currents flow, carrying away the finer detritus. Unless, too, the banket of Zululand is wholly independent of that of Klerksdorp and Heidelberg, the mere extent of the deposits would preclude any lake to which the name of inland sea would not be more appropriate.

Banket Deposited in East-West Currents.—The vast thickness of the Lower Cape, together with the physical character of the beds, indicates that the material was deposited off a subsiding shore which underwent depression more rapidly at some times than at others. It must always have been subject to currents of considerable strength, and these were probably strongest when the depression was most rapid. The direction of the shore was, roughly speaking, east and west, possibly with off-lying islands, and the direction of the currents must have been from east to west. This is easily proved. It is well known that the present rather vigorous currents of the African coast flow down the east coast, across the Cape, and up the west coast. They flow as nearly in a westerly direction as circumstances permit, and were a broad channel to be formed across Africa in the latitude of Johannesburg the currents would flow through it from the east with greatly increased vigor. The currents must always have had this tendency, for they are due to the direction of the prevailing winds, which again depends upon the direction of the rotation of the earth. A practical result of these conditions is that, other things being equal, the coarsest conglomerates of wide extension must have formed along straight stretches of east-west coast, while in the shelter of bights or promontories finer material would settle. Local accumulations of coarse material might, however, occur where the irregularity of the coast line was such as to give rise to violent eddies.

The above considerations are, of course, independent of the theories of gold deposition, and would apply if there were not a pennyweight of gold in the country. On the Rand, however, there certainly is a relation between the coarseness of the pebbles and the amount of gold, so that on any theory of deposition the distribution of conglomerate is important.

Upheaval and Injection.—The disturbances to which the Lower Cape has been subjected are important and interesting, but by no means fully worked out. It is sometimes assumed that the beds were laid down horizontally. For a small area such an assumption is justifiable enough, but it is quite insufficient, even as a rough approximation, when one is dealing with beds a score of miles, or many score of miles, in length. One has only to recall the beaches of any coast line with which one is familiar to perceive that bights, points, shallows, and deeper basins are almost certain to occur within a dozen miles; while islands as well as coastal sinuosities are of frequent occurrence, particularly in a subsiding area. When such a region is disturbed, bent, and faulted, the final configuration is the resultant of the original irregularities and the induced movements. Along the Witwatersrand proper the coast would seem to have been remarkably straight, and the chief disturbance has been a rather sharp flexure of the northern edge of the series upward. In Deep Levels the dip of the strata is usually between 20° and 30°, while at the croppings 60° is more characteristic, and some of the properties show outcrops which dip nearly vertically, but this is only a local exaggeration of the general tendency. The low range of hills called the Witwatersrand is formed of the upturned edges of the Lower Cape beds. The line of greatest flexure of the beds is, in most cases at any rate, still beneath the surface. The flexure of the beds was accompanied by innumerable fractures attended by small faults. The faults have not as yet been systematically studied, but some of them are normal, some are overthrust; some follow the strike, others the dip. I think there is no doubt that the systematic relations of the principal faults could be elucidated, but much information not recorded on the mine maps would be requisite for a discussion. The indications of the association of normal and abnormal faults are that the pressures acted at a considerable angle to the horizon. The dislocations were accompanied by the injection of the country with large numbers of dikes, which appear to be diabase and related rocks. Between the Lower Cape and the Upper Cape is a sheet of amygdaloidal diabase, which probably escaped through some of these dikes, and both disturbances and intrusions seem to have occurred for the most part before the Upper Cape was deposited, though minor disturbances certainly occurred at a later period.

It is desirable, from an economic point of view, to observe the evident deduction that the present croppings of the reefs are not at all likely to represent the beds at a uniform distance from the original shore line. It is almost unthinkable that a mass of beds should have been turned up and eroded off so regularly that the croppings of the residual mass should coincide with the contours of the undisturbed strata. When the disturbance is accompanied by faults the difficulty of such an hypothesis is increased. Hence the auriferous character of the present croppings for thirty or more miles indicates that the gold-bearing pudding stones represent a broad band or sheet of metal-bearing rock, not a narrow strip along an ancient shore.

Geology of the Yukon.*

NUMBER III.

For opening up more rapid communication, some route from the coast in the vicinity of Juneau seems most feasible. The waters of the Yukon are navigable for river steamers of light draft up to the head of Lake Lindemann, except for two or three places where short rapids exist. Two or three steamers, built with due consideration as to the character of that part of the river on which they were to ply, would form a complete connection between the head of Lake Lindemann and the gold region during the four or five months that the river is unfrozen. The head of Lake Lindemann is only twenty-five miles from the navigable water of the sea. Another measure which would be of great value would be the building of a wagon-road from the coast, in the vicinity of Juneau, to the junction of the Lewes and the Pelly rivers, which point is below all obstructions to navigation. This road could be built across some of the mountain passes other than the Chilkoot.

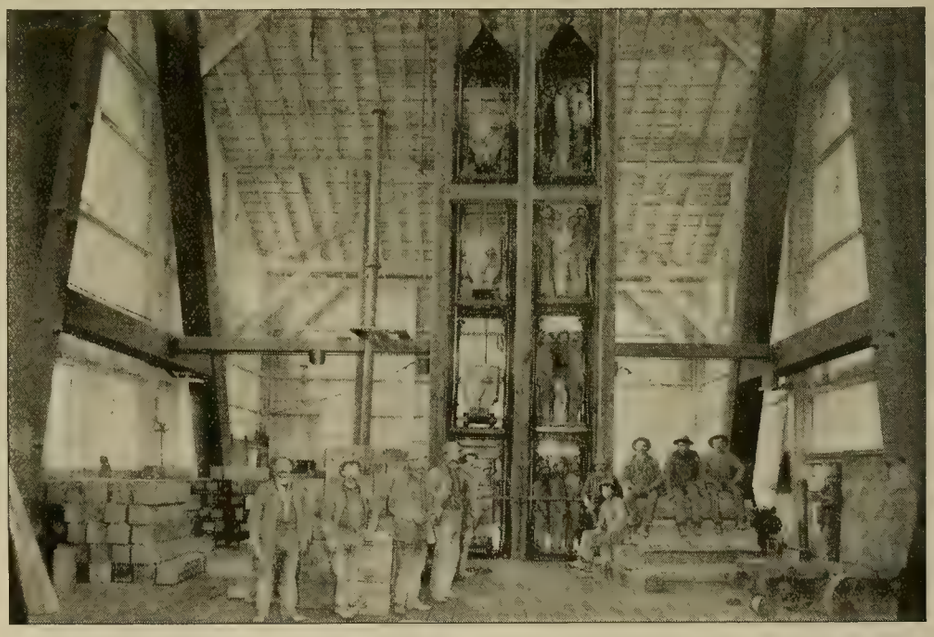
In bar diggings, the material which has to be washed consists largely of coarse, round pebbles; and by whatever processes the gold is extracted, these pebbles are separated first. There then remains the finer material, which is made up of the heavier constituents of the same rocks. Black sands which consist of magnetite, hematite and sometimes galena are nearly always abandoned, and in some diggings there is a "gray sand," consisting mainly of heavy spar; and when, as in Forty-Mile creek, the stream flows through schists, garnets derived from these form a very important part of the residue. All these, however, are still lighter than gold, and are evidently separated from it by means of their inferior specific gravity, through the agency of water applied in various ways, or finally by air applied by a bellows.

The gold pan which is worked by hand is the simplest contrivance for separating the gold from the gravels. The next contrivance generally made was the cradle, which is constructed on essentially the same pattern as cradles which were used in California and Australia in the early days of placer mining. The cradle consists essentially of a long, narrow box, with an upper and a lower compartment. The floor of the upper compartment is preferably made of metal, and is riddled with holes of convenient size. Into this upper compartment the gravels are shoveled, and the whole contrivance is moved back and forth upon the rockers on which it stands, and from which it derives its name. By this shaking the gravel is sifted; the finer material passes through the holes into the lower compartment, while the coarser material, which contains little or no gold, passes out of the box as usual rubbish, or "tailings," as it is technically called. The floor of the lower compartment is in its simplest form an inclined plane, the surface of which is roughened or corrugated in various ways, such as by the use of cleats or wooden "riffles," corrugated metal sheeting or other devices. A favorite method of obtaining this result among the miners of Alaska is by the use of carpet of coarse, spongy weave, such as ordinary tapestry. Upon the roughened surface the gold lodges, while the lighter material is carried by out of the box by the stream of water. In the collection of fine gold which is thus caught, amalgamation with quicksilver is usually resorted to.

In some bars there is considerable concentration of gold, and when the river is sufficiently low these accumulations are worked by the miners; but the comparatively smaller size of the deposits, and the fact that they are exposed only an uncertain length of time during low water, lead to the necessity of using the simplest apparatus, and so the cradle is generally utilized.

In the gulches the conditions are entirely different, since the amount of water in the stream bed is usually small and can be diverted, if necessary, and the gold occurs in a small channel in the narrow gravels. These gulch gravels vary in thickness from about 3 or 4 feet to 20 or 30 feet. Their upper parts, however, are invariably barren. The gold is all found concentrated at the bottom, whatever the thickness of the upper gravels may be. The gravel which contains gold in workable quantities is technically called "pay dirt." It is usually not more than 3 or 4 feet, and from that thickness it runs down to a few inches or less. The bedrock itself, at the junction with the gravels, usually contains gold, and often repays working for two or three feet down, and sometimes the richest dust is found in this partly disintegrated schist. In the thin layer of pay dirt which rests upon the schist, the gold occurs in particles disseminated through, with gravel containing many large and little-worn fragments of schist and quartz.

When the overlaying barren gravels are not too thick, they are stripped off by shoveling, and the pay dirt is laid bare. Then a long, slightly inclined trough, called a sluice, which is built in sections of equal length, so as to be taken down easily and transported from one place to another, is constructed of boards. The boards for this purpose are cut by the owners from logs, with the aid of a whip-saw. The different sections of the trough or sluice are called boxes, and when these sluice-boxes are arranged consecutively, and in position convenient to the deposit of pay dirt, the water flowing in the bed of the gulch is partly diverted into them, so that a continuous stream flows through the sluice and empties at its lower end. The pay gravel is then shoveled into the boxes, mostly into the upper ones, so that the gravel will be carried as far as possible before being thrown out. The current is so regulated that the finer and lighter materials and the smaller gravels are immediately carried out of the trough and deposited at the lower end, while the large pebbles and the heavier small particles sink to the bottom and advance more slowly. The largest stones are removed by a miner who stands ready with a shovel to clear the boxes of such incumbrances. The heaviest of all the materials is the gold, which finds its way to the bottom of the sluice.



To prevent this from escaping, a series of slats are inserted in the bottom of one or more of the boxes at the end of the sluice, and these slats or "riffles," as they are called, afford a lodgement for the heavier particles. The riffles are usually placed parallel to the sides of the box and connected by cross cleats, although various other patterns are employed. At stated intervals the current of water is turned off from the sluice, the slats or riffles are taken up and the heavier material which has accumulated is carefully collected. This accumulation is very rich in gold, and also contains magnetite, hematite, limonite, galena and pyrite, as well as many fragments of rarer heavy materials. This material is generally washed by hand in a gold pan, thus securing a greater concentration of the gold; but there still remains some pyrite, galena, hematite and magnetite which cannot well be separated from the gold by washing. The magnetic iron, which is known as "black sand" by the miners, is extracted with a small hand magnet, and the other minerals are separated from the gold by blowing the aggregation with a small hand bellows. The pyrite, hematite and galena thus blown out are roasted, ground and panned, and then yield considerable free gold.

PRECIPITATING COPPER IN SOLUTION IN WATER FROM ST. LAWRENCE MINE, BUTTE, MONTANA.

INTERIOR OF A SHAFT HOUSE IN BUTTE, MONTANA, SHOWING FOUR-DECKED CAGE.

Butte, Montana, Copper Mines.

On this page are depicted two Butte, Montana, mining scenes, one showing scrap iron scattered in pools of water from the St. Lawrence mine, on which copper is precipitated, another showing a four-decked cage, men on one side, cars on the other, ready to descend in the main shaft of the Anaconda. The engravings are furnished through the courtesy of the Butte *Miner*.

Mining Summary.

CALIFORNIA.

Amador.

The Lincoln mine at Sutter Creek, which has been idle for nearly twenty years, has been bonded for four years for $200,000 to a Scotch company.

The final payment on the Anita mine was made last week in the sum of $10,000.

At Jackson the Acme tunnel is in 240 feet and that on the Tiger has been pushed 100 feet. Both properties are showing well.

Dispatch: At West Point mining affairs are decidedly looking up. Old and new properties are being worked, and in most cases with satisfactory results. The Machu has been bonded to parties who propose to give it a thorough trial. The Scottish Co. has commenced work on several mines in the district in a small way, with the promise of largely increasing its working forces. Work is being done in the Ketz, Smuggler and Paragon mines, and results are said to be satisfactory. On the Beauchemin two shifts are at work.

Work at the Alma has not stopped permanently; so soon as title to the eastern portion of the property can be secured, work will be pushed.

At the Driesbach a tunnel has been run below the shaft, and a ledge of good ore has been struck.

On the Peter King mine the tunnel is 470 feet.

Record: The Oneida shaft, which is down about 1500 feet, has cost an average of $65 per foot. The cost of the Gwin shaft, which is of smaller dimensions, is understood to have been from $35 to $50 per foot.

The Argonaut mine is the largest producer in Amador Co.

The Baliol mill was started again last week. The company is preparing to sink.

Butte.

The new 40-stamp mill at the Banner began crushing last Wednesday.

The Big Betsy mine near Enterprise is to be operated again.

The Nimshew mine will soon be in operation again.

Mercury: The shaft on the Mt. Ida, near Hurleton, is 90 feet with a 100-foot crosscut at that depth. The ledge was 18 inches at the top, but averages 6 feet on the crosscut. A 5-stamp mill is running constantly.

Calaveras.

Ten stamps are kept dropping at the Gold Hill mine. The ore is said to be very satisfactory. Fifteen men are employed. C. Wolf is Supt.

At the Demarest ten men are employed and the work of straightening the shaft, retimbering and puttiug in a skip is in progress. The shaft which was sunk years ago to a depth of 125 feet, has two levels, one at 80 and the other at 100 feet. The mill has been running for the past two weeks and the ore and sulphurets—especially the latter, assay very high.

At the Lightner M. Co. twenty-six men are employed erecting the mill and sinking the shaft, which is down 450 feet and crosscutting is in progress at the 200, 300 and 400-foot levels. The new machinery is to be in running order March 15th.

Chronicle: Last week fifty-five boxes of crystals were shipped from the Green Mountain mine to New York and when values are better determined, the owner, if warranted, will return to Mokelumne Hill and prosecute a still more extensive exploration of the ancient river channel. The Green Mountain mine is to be opened at once for hydraulicing.

El Dorado.

(Special Correspondence). — Work is progressing favorably and rapidly at the Limpensel mine on the outskirts of town. This property was worked for pockets principally, but for many years it has been idle. Recently J. C. Diamond secured an option on it and is pushing its development. The shaft is 120 feet, and on the ledge for 75 feet. An old tunnel has been put in good repair which taps the shaft. In the tunnel the ledge is 25 feet. The footwall is greenstone and the hanging is greenstone. The ledge is on the east belt of the mother lode. One would scarcely believe that exceedingly rich ore has been encountered in the short distance the shaft has been sunk, but "seeing is believing." J. C. Diamond of San Francisco is part owner and manager.

Placerville, Feb. 7th, '98.

(Special Correspondence). — The Goldbug Mining Co., a Cleveland, Ohio, corporation, after two years of continuous work, has completed its plant, which is of considerable magnitude. The property comprises 150 acres of tailings of the Canyon Creek placer mine, operated forty years ago. A bedrock cut 8 feet wide and 600 feet long is a portion of the work, together with a complete hydraulic plant, installed by the present company. They will use 300 inches of water under a pressure of 350 feet, and will work under permit from the Debris Commission. The property is one and one-half miles from Georgetown. A. H. Ten Broeck is Supt.

Georgetown, Feb. 8th, '98.

Work has resumed on the Mt. Pleasant at Grizzly Flat.

The Bright Hope and Taylor mines resumed operations last week, the water supply having become sufficient for power purposes.

Nine men are at work in the Franklin mine on the tribute system.

Work is progressing in both shafts at the Griffith Con.

Nugget: A San Francisco development company has bonded a quartz ledge on the Egger range and started work. They have appointed J. J. Grossman Supt.

The Engesser is turning out well. They have a vertical shaft 75 feet and some rock highly mineralized.

Drifting is going on in the old Petaluma tunnel near Fair Play by a Sacramento company. The Mulkey mine is taking out rich gravel from a 60-foot channel, with 4 feet of gravel.

Dunn & Gillespie, above Fair Play, have an upraise of 10 feet to make to tap the channel.

Humboldt.

The new way of raising and sluicing sand now being carried on in beach mining by Olmstead, Parker and others, on the first claim above the mouth of Harris creek, is the first of the kind ever tried in that part of California. The plan is a simple one. Water is run from a dam on Harris creek through piping to the claim and into the sand pit, in the center of which is a 5-inch pump. The water reduces the sand to a consistency that makes the mixture easy for the pump to handle, and instead of being shoveled into the sluices the sand is pumped in, thus enabling the pump to handle, with the aid of three men, about what it would require fifteen men to shovel. The plan was conceived and put into operation by E. Ellis, and is under his management.

Inyo.

The Inyo County Mining and Development Co., formed one year since, which purchased the Lane silver mines near Keeler, has three claims. Three shafts have been sunk, the deepest one 700 feet. In all, the tunnels and shafts now aggregate 2700 feet, all of which have shown ore. A smelter is being erected at the mine.

Kern.

The new district, eight miles west of Kernville, is attracting considerable attention. The greatest depth attained in the district is 80 feet, through a tunnel on the Welsh Gillan mine, from which a number of tons of free-milling ore have been taken which assay over $20, the ledge being 6 feet wide. On the Margaret mine the vein at a depth of 100 feet changed from porphyry to quartz. Ore from these mines is milled at the low rate of $3 50 to $4 per ton, the cost of hauling to the mill being only 70 cents. About forty claims have been located.

The pleasant weather has facilitated dry washing in the Stringer section and several machines are at work on pay dirt.

At Randsburg the Yellow Aster M. Co., the Rand group, is sending ore to the mills at Garlock. The new road has made a rate on ore, graded according to richness, $1.25 to $3 per ton to Kramer. A new stamp mill is to be erected on part of the ground belonging to the Kinyon mine. Figures show it cheaper to haul the water to the mill than to haul the ore to the water.

Ryan Bros. of San Francisco are building a thirty-ton cyanide plant at Rosamond, where there is abundance of water. Conklin & Baker, owners of the Elephant mine, Mojave district, are building a large ore-house. There is on the dumps and in the mines considerable sulphurets which can be reduced when local mills, concentrators and cyanide works are established.

Mariposa.

(Special Correspondence).—The California Exploration Co. expects to start its new 10-stamp mill on the Virginia mine about Feb. 12th. The old 8-stamp mill has been torn out and a new plant installed, with ten 950-pound stamps, two vanners and a concentrator. The company has also put in an air compressor and drill plant and an electric lighting system, and a new hoisting engine will be in place at the main shaft shortly. Sinking is in progress below the 400 level. About ten men have been temporarily laid off as all available storage room was already filled with broken ore.

The Lafayette M. Co. has secured an option from P. P. Mast, of Springfield, Ohio, for the Bandarita mine and mill, on the North Fork of Merced. They will extend the lower tunnel some 500 feet and crosscut the vein. In the mean time the mill will be placed in good order for operation.

The Standard Con. Co., of Bodie, has resumed work on the Shilling property, on the North Fork, and will continue sinking on the vein. One payment has been recently made on the property.

Two men were severely crushed in the Virginia last week by a slight fall of ground, and on the 5th two miners were killed by an explosion in the Teadron mine, at Whitlocks, and on the same day one man was killed in the Gambetta, at Grub Gulch.

The tunnel on the Bondurant is still being run to catch the ledge in the old workings. The face of the tunnel is now about 300 feet beyond the point where it was expected to cut the ledge. In the bottom of the shaft on the old workings, 800 feet above the tunnel, the vein was very flat but it seems to have straightened up very much below that point. The work is being done by the Boston & Mariposa M. Co., which formerly operated the Red Cloud mine.

Hilliard & Hedges have declined the offer of J. W. Mackey for their Marble Springs property, recently reported in this column.

Mariposa, Feb. 7th, '98.

Mono.

At Lundy the Jackson and Lake View M. Co. closed down February 6th. Of thirty miners and millmen four remain as watchmen. Operations will be resumed next spring. The past few years this company has been working day and night, and now repairs must be made.

Supt. Nelson of the Copper Mountain mine shipped six tons of ore to Bodie to be worked by the Soderling process.

Napa.

Calistogian: The Sulphur Bank quicksilver mine has been bonded for a period of six months, and it is stated that the new company will commence operations at once.

Nevada.

(Special Correspondence).—The Brunswick Con. mine has completed its new pumps which are among the largest of this section. Three plungers of 10, 12, and 14 inches have been installed to the 900 level. The mine will be unwatered in about ten days, and then the mill will be started.

The company is drifting on the 900 level, having gone east 380 feet, and 520 feet west. When work is resumed, it is hoped that there will be good news to chronicle from this property, as evidenced from the encouraging strike made before closing to install the pumps. They who should know anticipate that the Brunswick will henceforth be among the dividend payers of the county.

The management, I learn from trustworthy sources, has been changed from New York to California. Freeborn J. Fletter, of San Francisco, is Gen. Mgr. and Wells, Fargo & Co. treasurer. C. H. Mallon of Nevada City continues as Supt.

Grass Valley, Feb. 7th, '98.

(Special Correspondence).—The old Kirkham and Cleveland properties, comprising four claims, which were combined into one group and are now known as the La Suerte mine, had been abandoned for years. The present company began work in May, '96. They have 2000 feet of tunnel and a shaft 350 feet, at which point they are cutting a station. They have a steam hoist and a 10-stamp mill run by water. The ledge is 3 feet and the ore a fair grade. J. M. Buffington is Supt. The property is owned by San Francisco people.

Nevada City, Feb. 7, '98.

T. T. Kirkbam has begun work on his gravel claim at Mt. Vernon, using a 2½-inch nozzle and about 100 inches of water.

The Gold Bar and O. K. mine, a mile east of the Idaho-Maryland, idle for a number of years, is being equipped with a mill and hoist. It has a 300-foot tunnel and a 2½-foot ledge. A shaft is down to water.

Telegraph: A crushing of thirty-six loads of ore from the Wisconsin mine at Grass Valley yielded $20 per ton. Work is going steadily on in the mine and the further the developments the more the encouragement.

Placer.

Illustrating the need of water in mining operations, the Colfax *Sentinel* says: The winter has been a disastrous one for hydraulic miners. Monitors are in place, dams have been constructed and permits to mine have been issued as follows: Two monitors near Colfax, two monitors at Gold Run, four monitors near Dutch Flat, one monitor at Lost Camp, one monitor at Shady Run, one monitor at Mayflower mine, one monitor at Yankee Jims, one monitor at Michigan Bluff. At the above claims, with the exception of one at Colfax and two at Dutch Flat, they have been patiently awaiting water since early in December. With plenty of water, each should have made at least two clean-ups. Nearly all of the drift mines have been short of water for washing gravel, and consequently reduced their force of men. Owing to continued cold weather and short supply of water, but ten of the twenty stamps at the Pioneer mine have been dropping for several weeks.

At the Cedar Creek mine, Shady Run, the drift is 300 feet in length, 7 feet high and 6 feet wide. The gravel is considered rich. A. Rodgers is Supt.

The vein in the Hobart mine, near Alta, measures 30 feet and the ore is rich. W. Nicholson is Supt.

The Mohawk drift, on Moody Ridge, is working steadily.

The Gold Blossom mine is now one of the largest in Ophir district. At the Three Star, a large mine, work is progressing rapidly. The Hathaway is working a large force, and the Bowlder, Eclipse, Pellows and Doyge are all working.

Sentinel: The outlook at the Lost Emigrant quartz mine on the North Fork of the American, sixteen miles from Soda springs, is said to be encouraging. The shaft is 74 feet on the ledge. A test of rock on the surface shows a value of $165.80. Ore from the bottom goes $173 to the ton. The mine is owned by Goulden & Co.

Plumas.

Tunnel No. 1 of the Arctic mine is in 275 feet, from which point a drift is being run on the gravel bed. The gravel shows colors and is indicative of success.

Bulletin: The ore of the Butte Bar Ledge mine near Plumas assays $40 51 gold and $5.70 silver; concentrates assay $154.21 gold per ton and $34 21 silver. The ledge is from 6 to 10 feet wide. With a short tunnel it can be tapped 1500 feet in depth.

San Bernardino.

The *New Era* says word has been received from New York that the application of Mr. Sigafus, the present owner of the Good Hope mine, for a new trial has been denied by the United States Court of Appeals, and that the judgment of $300,000 obtained against him by the Good Hope M. & M. Co. over a year ago will stand.

San Diego.

Capt. Farnsworth is having 100 tons ore from the North Star crushed at the Ready Relief mill.

The second report of Receiver Pauly of the Golden Cross mines at Hedges covers from Oct. 1st last to Jan. 1st. At the time of the previous report, October 1st, the receiver had on hand $50,239.65. A clean-up on Nov. 1st netted $46,430.26, a clean-up on Dec. 1st netted $47,066 61, and the clean-up of Jan. 1st, 1898, netted $43,086 31. During the time covered by the report Receiver Pauly incurred and paid out $141,407.96, and has in bank $48,808 92, from which is to be paid $19,161.59 for labor, fuel and merchandise in December. The receiver has paid to the defendants in the case of the Golden Cross M. & M. Co. vs. James Spiers et al., under which Mr. Pauly is acting as receiver, the sum of $60,000; and according to the report the mines will produce sufficient bullion to pay off all indebtedness of the property. The average number of men employed is 214. The 40-stamp mill that has been lying idle has been put in repair and as soon as the ore is supplied will start up.

H. W. Blaisdell has bought the old Dr. Jaynes mines, in the Picacho district, and will erect a stamp mill.

At Hedges the Free Gold Mining Co. has 200 employes at salaries ranging from $2 to $8 per day. The monthly clean-up seldom amounts to less than $50,000. The three big mines of the Golden Cross group are the Cross, the Crown and the Queen. The latter is being successfully worked beneath the fourth level. Above, the damage by fire was so great and the ore bodies so nearly exhausted that it has not been deemed prudent or advisable to attempt to clean the levels out.

Southwest from the Queen a quarter of a mile is the Crown, where the working shaft is 550 feet deep. Between the third and fourth levels most of the work is being done in this mine, and almost daily new bodies of ore are being opened up. North of the Crown a few hundred yards is the Cross, the original discovery.

Shasta.

C. E. Newton is mining on the river below the Calumet mill and meeting with success. The three furnaces at the smelters were all in full blast last week, which has not been the case for a long time. It means the employment of many men and a bigger pay-roll.

The Summit mine, at Sunny Hill, has a drift and drift tunnel in over 1100 feet. Several small ledges were crosscut in running the drift. A contract has been let for 300 feet of drift, to find the main ledge.

The old Lucas mine, on Middle creek, near Shasta, is being reopened, preparatory to extensive development. The tunnel is in 200 feet, in which the vein averages 18 inches. In the shaft, at a depth of 40 feet, it is between 3 and 4 feet.

Searchlight: The Milk Maid mine is running in full blast. There are thirty men employed.

The Hobo mine, above French Gulch, is again in operation.

The Vagle and Rheinhaus mine is taking out good ore.

The Washington mill started last week on good ore. It is worked under lease.

The Hunt mine at Tower House gives promise of being a good property.

The 4-stamp mill at French Gulch is running in good rock.

At the Chapman & Valentine mine, near Centerville, work is being prosecuted on a 30-foot bank—ground that was formerly drifted on the bedrock. Good results are being secured on the same ground by piping.

Johns & Co., who recently completed a run of ore at the Uncle Sam mine, under a lease, have secured another lease for six months and began taking out ore. The property is owned by the Sierra Buttes Co.

Sierra.

(Special Correspondence).—The main tunnel on the Stanley Drift mine has reached 2400 feet through serpentine. It strikes the channel at 1500 feet. There are 2500 feet additional of tunnel work, all in pay gravel.

The gravel runs from 15 inches to 50 feet in depth; the average pay streak is 3 feet. The ground pays an average of $1.50 per car by the sluicing process, though the gravel is cemented. There are 225 acres in the mine, and 5000 feet of a channel yet unopened.

Alleghany, Feb. 5th, '98.

P. Doray has leased his Slate creek claims near Sierra City for $5000.

John Lassiat of Poker Flat is in charge of the copper ledge on the north fork of Canyon creek.

The Miners' Home Co. proposes to work over the drifted ground at Howland Flat.

A San Francisco company has taken hold of the Rising Sun mine, Sierra City. As soon as the pipe and machinery arrive they will begin operations.

Wm. York and sons, who some time ago struck it rich in the Rising Sun, Downieville, again encountered rich rock last week. A bar worth $650, representing a portion of the clean-up from the arrastra, was shipped last week.

Siskiyou.

The Northern, working the bed of Dutch creek, is sinking to bedrock and expects to put in an elevator, as the diggings are deep and there is no chance for drainage. This Dutch creek is a different one from that near Honolulu.

The Chinamen at work on Greenhorn have been obliged to shut down, on account of the court deciding against their right to use the bedrock drain of the creek claimed by Scheld.

The warm weather of the past few days, and the welcome light rains, have enabled several companies to start work.

The Aromas Co., near Sawyer's Bar, is pushing work on the new ditch, to be ready for work in the early spring.

In the Morrison & Coburn mine, Quartz valley, the shaft has been extended 120 feet; a drift on the vein is being extended 100 feet.

The Mountain Bell and Mountain King quartz mines, on Humbug, sold a half-interest for $2500.

Chester and Lighthill took $191 in specimen gold from a little chimney in the Myers mine, in Quartz valley.

I. Baer has purchased an interest in the Barnes mine on Cherry creek.

Hunter & Smith are taking out some rich rock from the Barnes mine at McAdams. Four tunnels are being run on a vein of ore varying from 8 to 16 inches.

F. Mallow is working the Craig mine on Cherry creek and has finally tapped the back channel. He has ground that is paying him from $3 to $5 per day to the man.

H. Schroeder of Deadwood has a ledge of rich ore and will build a new mill in the spring.

Baker Bros. are getting pay ore from the Smith mine on Indian creek.

Journal: Machinery is being arranged for hoisting from the new shaft at the Cavern gravel mine, Yreka. The property is bonded to a Colorado company.

Hansen & Dannenbrink Bros. of

operating the Gold Run quartz mine at Know Nothing creek.

The Baker Bros., at Indian creek, are taking out good ore.

The Solomon quartz ledge on Solomon river is being worked by Bowerman & Fletcher and yields $10 per ton.

Scheid & Butler, Yreka flats, are sinking to reach bedrock. The gravel gives good prospects.

Hunter & Smith started work in the old Barnes ledge at Cherry creek.

Trinity.

The Highland mine is thoroughly fitted up and will be worked full blast as soon as water comes.

Along the river from Taylor's Flat to Willow creek a number of placer properties are being worked. New discoveries have been made in that section of high benches of gravel.

Tulare.

There was a lay-off of miners at the Tale mine, White river, until the rock taken out is ground. If they have a good clean-up, the mine will run full blast. Otherwise it will be closed.

Tuolumne.

The Mother Lode Co. has begun the construction of a 10-stamp mill on the Sell mine, near Sonora. There are 22,000 tons of ore that will yield over $8 per ton. The vein in the Sell has been opened a distance of 700 feet in length and a depth of 700 feet from the surface, the body of pay ore being 400 feet long.

Work at the Dutch M. & M. Co.'s new mine, the Dreicham, is being rapidly carried on in daily expectation of opening a rich vein.

The new milling plant of the Gagnere M. Co. at Tuttletown is in operation. The battery blocks measure 30x32, the battery posts 20x26. The foundation is rock and cement. The retaining walls are constructed of stone. Both mill and hoisting works are lighted by electricity.

Democrat: At the Estrella the crosscut tunnel is being driven rapidly. It measures 247 feet.

The new double compartment shaft on the Gerrymander is down 45 feet.

The Grizzly is running a third level from the new shaft to tap the old workings.

Progress is being made in the crosscut tunnel on the Hope mine.

Yuba.

(Special Correspondence).—John Martin & Co. are operating the Abbio, one mile from Brownsville, and are running ten stamps. They are erecting a cyanide plant, which will be ready to start in about a week, for cyaniding the sulphurets and tailings.

At the Good Title they have reached beyond 200 feet depth. The ore in the bottom of the shaft averages 6 feet and is of low grade. About one year ago this property was opened by J. E. Poingdestre of Nevada City. T. J. Carson of Cincinnati took charge January 1st.

J. E. Poingdestre, still a director in the Good Title mine, has purchased the John Johnson mine and ranch, comprising 140 acres, U. S. patent, in Yuba county, two and a half miles from Forbestown, on which he will begin work early in spring. There is a shaft on the mine 45 feet. The ledge is 5 feet on the surface and 8 feet at the bottom of the shaft. A number of assays have been made and they run from $3.50 to $8 per ton in free gold, and 8 per cent in sulphurets that go from $125 to $350. The property will be thoroughly and systematically developed with a view to paying especial attention to it as a low-grade proposition, and treating the sulphurets by the cyanide process. With the capital that developed the Good Title, and its successful management, this section has attracted attention. The Abbio is also proving a success thus far. The Denver, near Forbestown, is giving satisfactory returns through its 10-stamp mill. The Gold Bank, in its low-grade ores, has proven a success.

Forbestown, Feb. 7th, '98.

(Special Correspondence).—At the Pennsylvania mine work is progressing. The company is running a drift on the 800 level. The ledge is 4 feet and the ore a fair-grade quality.

Browns Valley, Feb. 7th, '98.

Appeal: Engineer Hubert Vischer and ten assistants have commenced work at the Narrows, one mile northeast of Smartsville, to ascertain at what depth bedrock may be found.

NEVADA.

Dr. W. J. Nelson of Boston has bought from Johnson, Lund & Campbell for $200,000 a group of twenty-four claims in the Eagle Valley mining district, seven miles southwest of Stateline district, Lincoln county. Dr. Nelson is at the head of the Boston Copper Co., which is operating a smelter in Lyon county.

Mr. Holmes of South Africa is at Como, in the interest of English capital, investigating the Logan and Hully mines. If the properties meet with his approval, his company will purchase and develop them on a large scale.

OREGON.

The Seven Devils mines is making daily shipments of high-grade ore.

C. Martin is hydraulicking with good success near Medford.

Read & Broad are operating the Oregon Bell quartz claim on Forest creek, Medford.

At the Braden mines, near Ashland, about $1000 was cleaned up in a ten days' run.

The Lucky Queen mine, near Ashland, has been leased to Spokane parties.

F. McCracken is working a promising placer mine near Leland.

Three tons of ore from the Golden Standard, Ashland, yielded $436, an average of $145 a ton. There is a large quantity of quartz in sight.

Over $1000 in gold has been taken out of the new mine found about a mile from Canyon City.

J. Johnston has purchased the Big Blue, Blue Bird and Great Eastern mines, near Baker City, and has begun operations. The ore run $22 per ton in gold.

The Crystal Palace, near Union, is being thoroughly developed by E. E. Clough.

Work is being done on the Ollie Woodman, near Union, with good prospects.

E. E. Clough is developing the Ainsworth, at Union, with reasonable anticipation of having a good property.

Returns from ten tons of ore from Barron & Shepherd's mine in Sampson creek district, Ashland precinct, have caused quite a number of claims to be located there.

Ashland *Tidings*: The purchasers of the Bonanza group of mines, which includes the Eclipse, Hidden Treasure and Oregon Bonanza, paid a cash consideration of $4000 for the properties.

Baker City *Republican*: There will be twenty additional stamps dropping on the ores of Grant and Baker counties in a short time.

F. Pfau, Mgr. Bonanza-Elkhorn M. Co. at Elkhorn mountain, says that his company is doing extensive development work. A tunnel to be 2000 feet in length is now in 500 feet. Already three ledges have been cut.

WASHINGTON.

Work has begun on the group owned by the Uncle Sam M. Co., on Dead Medicine creek, in Stevens county. M. McCarty of Bossburg is Supt.

BRITISH COLUMBIA.

The ledge has been struck on the Riverside claim, three miles north of Grand Forks. The tunnel at a distance of 180 feet is in ore carrying good gold values. The tunnel will be pushed ahead until the ledge is crosscut.

The group of claims, near Claycquot, were sold for $30,000 to a Colorado Co.

Reisterer & Clements of Nelson purchased the Bismuth, Squire and Leading claims, on Hidden creek for $5000.

The mineral exports of southern Kootenay for January are the greatest in the history of the district, aggregating $1,193,458. Compared with January, 1897, they show a gain of 100 per cent.

Work at the Fern mine is progressing and large bodies of ore are being uncovered. The company has commenced the installing of a cyanide plant. Thirty tons per day are milled. An additional ten stamps will be added as soon as the cyanide plant is installed.

A shipment of ore made last week from the Republic mine, near Slocan City, to the Nelson smelter went 205 ounces in silver and $18 in gold to the ton. The shipments from the smelters last week were: Nelson (Hall mines), matte, 40 tons; Trail smelter, matte, 240 tons; total value, $265,140. The total value of the ore and matte exported was $518,635.

IDAHO.

Dredging is soon to be tried in the gold belt of the Cœur d'Alenes. The parties interested in the undertaking are Eastern men. They have secured thirteen claims.

The stamps in the De Lamar mill are hung up and the pan mill department shut down. One hundred and ten miners were drafted. The leaching tanks will soon be completed and work will begin on the east half of the mill to equip it in a like manner. As soon as the tanks under construction are completed, enough miners will be put on, and the number increased as other tanks are completed.

The Chloride Queen M. and M. Co., near Wallace, has struck a stringer 18 inches thick that carries considerable gray copper and gold.

Work at the Cumberland, near Silver City, is progressing very satisfactorily. The mine is opening up much better than was anticipated.

Ten men are employed at the South Central, near Silver City, on development work. They are taking out some high-grade shipping ore from the lower levels.

P. J. Clark, on the Elkhorn at Ketchum, at 400 feet depth cut the vein on the footwall and tapped the ore shoot underneath the old works. In early days the Elkhorn is said to have produced over $1,000,000, principally from the surface.

The Rich Hill M. & M. Co., near Cœur d'Alene, is growing better as the tunnel is driven, and giving satisfactory returns.

UTAH.

The Geyser-Marion properties have been bonded for a period of four months to G. F. Downey on a basis of $450,000, or $1.50 per share, for the stock. At the annual meeting the Dern management was retained. The reports showed receipts to December 31, 1897, of $148,235.92, and disbursements, including $63,000 in dividends and payments for extensive development work, of $149,711.46, with product in transit not settled for. The gross cost per ton of ore mined and treated was $1.96.

The Lulu tunnel, in the Mercur mine, developed bodies of $12 and $15 ore through much of its course, but now at a depth of a little over 400 feet the ore across the face goes $23.60. This property paid $886,000 in dividends during the year and held a surplus in the treasury amounting to $178,972.10 January 1, 1898

Thirty carloads of ore left Lead mill and Bingham last week.

The shaft of the Star Con. Co. at Eureka is down 340 feet. A mill is one of the probabilities of the near future.

The Beck shaft at Eureka resumed sinking.

The recent shipment of gold ore from the Centennial-Eureka awakens renewed confidence in that mine.

The Crown Point M. Co. has brought suit in the United States Circuit Court against the Ontario Silver M. Co. to recover $1,955,285, the value of 35,506 tons of ore, which, it is alleged, the Ontario company has extracted from Crown Point ground.

The Mercur company, at its annual meeting, showed that the receipts for the year 1897, including cash on hand at the close of 1897 and the purchase price paid by J. R. De Lamar for the Resolute Fraction, was $706,704.30; disbursements for the same period, including $311,000 in dividends, $587,732.20. In the report it was shown that during the year 75,175 tons of dry ore had been mined and milled at a recovery of $6.47 a ton, and at a cost as follows:

	Per ton.
Cost of mining	$1.38½
Cost of milling	86
Cost of transportation	35
Total cost of mining and milling	$2.57½

MONTANA.

Sinking on the Spotted Horse mine, near Lewiston, is again in progress and ten of the twenty stamps in the mill are working.

The Peck Concentrator Co. has begun the erection of a plant, near East Helena. The U. S. smelter own and control the plant. Power will be furnished by the Missouri Dam Co.

At the 300-foot level in the Ruby mine at Townsend a rich ore body was cut which will average $70 in silver and gold to the ton, but the rich ore shoot which they expected to reach in 10 or 12 feet has not yet been cut. As it is, however, the mine is said to be wonderfully rich, and promises to become one of the great dividend payers of the State. In fact, the condition of the treasury at present is such that a nice dividend could be paid.

Inter-Mountain says the pumps at the Atlantic shaft of the Boston & Montana at Meaderville were hoisted last week, which is taken as an indication that the property will be abandoned for some time. Work was started about two years ago, during the time Capt. Couch was Gen. Mgr. of the Boston & Montana properties. It was supposed that the big copper ledges crossed the flat at some depth, and a shaft was developed to a depth of 800 feet. Bedrock was not reached until at a depth of 400 feet, where a petrified tree was found. Several crosscuts were run at the upper levels, but only stringers were cut.

SOUTH DAKOTA.

The shaft on the Two Bit mine, near Deadwood, is 140 feet deep and going down at the rate of 1½ feet a day.

The Golden Hill M. Co. at Two Bit has a shaft 60 feet in mineralized porphyry intermixed with blue shale which is highly mineralized.

COLORADO.

Nace & Davis have driven a 38-foot tunnel on the Helena W. at Eldora, and have a 20-inch vein of fine looking tellurium ore.

The Lakeview shaft, near Eldora, has reached 80 feet.

Work on the Irousides, Eldora, is being pushed. The tunnel is 40 feet, showing 18 inches of sulphide ore.

At a depth of 70 feet a vein 8 inches wide in the Harden shaft at Salida was uncovered last week. Assay returns were $9.60.

The Fowler smelter is running night and day on ore from the vicinity of Ouray, the Grizzly Bear, Wedge, Bachelor and American-Nettie being the principal sources. Iron ore from Leadville for fluxing is coming in at the rate of two cars per day.

At the Slide mine near Ouray ore has been encountered in the lower workings in such quantities as to foretell of this property again becoming a shipper.

Twenty tons of Congress ore is daily hauled to the Silverton smelter.

During January 173 ten-ton cars of ore were shipped from Ouray, an increase of forty-nine cars over January last year.

From fifteen tons shipped from the Central City mine, near Idaho Springs, the returns were $8.73 per ton. Daily shipments of fifteen tons are being made. The ore is taken from the 400 level, where it averages 6 feet.

The Tom Boy group, near Central City, was sold last week to F. Howbert of Denver. The shaft on the Tom Boy is 60 feet, and the new operators have commenced work straightening the shaft and putting it in shape for sinking.

The Fitz M. Co. began extensive developments on their properties at Leadville.

The Pyrenees shaft at Leadville has passed the 900-foot mark.

The Big Six and Nettie Morgan at Leadville are still shipping and there seems to be no sign of abatement in the discovery made some weeks ago.

S. Loder contemplates putting up a smelter at Ward with a capacity of 150 tons a day, adapted to treat the pyritic ore of that vicinity.

Hanum & Co. have secured a lease on the Abe Lincoln. It is their intention to put in a large pumping plant and compressor and work the property on an extensive scale.

A new ore chute has been opened in the Claypool block of the Bonanza King at Cripple Creek.

The Cripple Creek Con. Co. authorizes the statement that a rich and to all appearances permanent strike has been made in the Geneva claim.

The entire production of the Independence mine at present is smelting ore.

The ore shipments over the Golden Circle railroad from Goldfield for January was 8000 tons. The shipments from Independence depot will aggregate 1200 tons.

The bottom of the 24-foot shaft in the Grotto on Bull hill is filled with ore that will average better than $20.

Jackson & Co. are getting out 20 tons a week from the Lona Coning, Cripple Creek, the ore running close to $80 a ton.

The Garsten chute, opened a month ago in the Moon-Anchor, has been penetrated by the 400 level a distance of 40 feet, and carries good ore all the way. The Cobb chute has opened out again and measures 76 feet on the vein.

Malloy & Johnson made a good find in the Raven at Cripple Creek. They started work a few days ago in an old shaft, and in a drift from the bottom at 135 feet opened 2 feet of ore that gives average assays of from $60 to $100 a ton.

The shaft on the Campbell, Beacon hill, has reached 100 feet, whence a level will be run on the lead.

The Little May at Cripple Creek is running a shaft to the depth of 200 feet.

Tribune: Assays of the quartzite encountered in running the Cowenhoven tunnel, at Aspen, average eighty ounces silver and a good percentage of lead. The highest silver assay is said to be 140 ounces.

The Fairmount tunnel, near Idaho Springs, is in 320 feet and has cut two blind leads.

Daily Mining Record: The long and stubbornly contested fight over the title to the valuable tract of ground on the south slope of Bull hill, known as the Hall City placer, has at last been definitely settled by the Secretary of the Interior in favor of the placer. The only two points upon which the lode claimants relied at the last were a failure to do $500 worth of work and the fact that the name of W. A. Smith, a deputy United States surveyor, was included in the patent. The Secretary of the Interior ruled that more than the required amount of work had been done, and that the other point was not vital in preventing the issuance of patent, though Smith's name was ordered dropped from the patent.

The decision of Judge Lunt concerning the rights of the tunnel locators will serve to depress temporarily the boom created by former decisions. The idea that a man or company can start a tunnel into a mountain and confiscate everything within 1500 feet of its line, merely because surface locators have not proved their veins to the tunnel level, is absurd. The whole question, under Judge Lunt's decision, will again come up for review in the Supreme Court of Colorado and possibly reach the United States Supreme Court before stopping. The gist of the decision is that priority of location cannot be invalidated by a junior location, nor can a patented claim be invaded by a tunnel.

NEW MEXICO.

New Mexican: Apparently trustworthy information states that Thomas A. Edison, J. C. Burn, Richard Kerens and Senator Elkins have secured a two-years' option on the 65,000-acre tract of mineral land in south Santa Fe county known as the Ortiz Mine grant. It is understood that the purchase price agreed upon is about $1,500,000.

The Gypsy mine at Kingston will erect a mill. A test of the ore proves that it can be profitably handled.

The Simpson smelter, Copper Flat, is turning out copper bullion. The Hanover is working thirty-five men and turning out sufficient ore to keep the smelter constantly employed.

On the Oxide, Santa Rita, sinking has been resumed below the 100-foot level.

Crawford Bros., Silver City, resumed work concentrating the tailings at the old Pacific mill. They produce nearly half a million pounds of concentrates per month.

Copper ore has been developed at the foot of Burro mountain, twelve miles from Silver City.

The main adit level on the Cooney mine is 800 feet in length. The ore is peacock copper pyrites, running high in gold. The concentrates have brought returns of 50 ounces gold per ton.

Dimmick Bros. have reached a depth of 200 feet upon their Silver Cell mine, south of Pinos Altos.

Ore from the Eagle mine in Gold Hill assayed 8.64 ounces gold and 24.6 ounces silver per ton.

ARIZONA.

The Sun Dance G. M. Co., near Prescott crushes about fifty tons daily and ships from 150 to 200 tons concentrates monthly.

The last monthly clean-up of Fortuna's 20-stamp mill, near Yuma, amounted to $50,000.

On the Senator mine, eighteen miles from Yuma, the 20-stamp mill is crushing fifty tons of ore per day, which is brought from the bottom, 200 feet down, where a level has been run about 50 feet.

The Eclipse group of silver mines, in the Bradshaw mountains, is to be prospected. A new boiler and hoisting plant have been placed and the 200-foot shaft on the Lorena is to be sunk an additional 200 feet.

Mines in the vicinity of Payson, Gila county, are showing encouragingly. The Pay Streak is a late discovery, said to have a 3-foot vein of high-grade gold ore.

At Evans' Point, six miles above Clinton, a mill is in operation, and ten additional stamps are to be added immediately.

At Cedar Valley, forty miles south of Kingman, the Cedar Valley M. Co. is operating a 15-stamp mill.

A good strike is reported from the Hidden Treasure mine, near Prescott, at a depth of 40 feet and in 120 feet, of a lead that will assay over $100 to the ton.

A 30-inch vein of six-ounce gold rock is said to have been uncovered in the Gladiator mine, th rty-six miles south of Prescott.

Gillette's mill, on the Agua Fria, started last week and is run by electricity.

The Copper Glance mine, near Wickenburg, has developed from 4 inches on the surface to 3 feet at a depth of 12 feet, yielding copper, gold and silver.

Henderson & Fulton are working the Lennon mine, on Lynx creek, Yavapai county, and have encountered a large body of sulphuret ore.

The Gold Cliff M. Co., at Pearce, Cochise county, will erect a 10-stamp mill.

The Table Mountain Copper Co., fifty miles north of Wilcox, starts its two 60-ton smelters this week. It is claimed that over 5000 tons of good ore are now on the dump.

MEXICO.

The San Felipe has suspended assessments.

The Santa Gertrude of Pachuca has declared its 308th dividend.

The Salomon M. Co. of Zacatacas has ordered its seventh assessment of $5 per share.

The Guadalupe de la Montana has made its fifteenth assessment of $1 per share.

The recent placer discoveries on the Santa Cruz, seven miles from Nogales, are attracting considerable attention.

Four Thousand Words a Minute.

Prof. Crehore of Dartmouth College last week read before the Franklin Institute a report to the Postmaster General of experiments made in England last summer by himself and Lieut. G. O. Squier, U. S. A., with the synchronograph, a recent invention for the rapid transmission of intelligence by the alternating current. According to the report, the experiments were successful, and, it is thought, will effect a revolution in telegraphy and telephony. The idea of the synchronograph originated in 1895, when Prof. Crehore used the alternating current in an unperfected state at Dartmouth College and sent and received words at the rate of 800 a minute. Since then machines have been perfected that will send and record 4000 words a minute. The result of the experiment made shows that the use of the alternating electromotive force, which rises gradually from zero to a maximum and then falls again to zero as gradually, is the best kind of wave for use on actual lines with disturbed capacities. The substitution of the synchronograph for the Wheatstone transmitter on identical lines, using the same receiver in each instance, showed a speed of operation by the synchronograph about threefold faster, provided the mechanical limit of the receiver was not already reached.

The causes of this great increase of speed are differences in the waves which pass through the receiver; since the only way by which the identical receiver can distinguish between transmitters is by differences in the actual waves received. The waves of current passing through the receiver, which control its operation, are not of the same shape as the electro-motive force waves of the transmitter. The current waves received from the synchronograph are not true sine waves in the receiver, even though the electromotive force is truly harmonic, but the frequency is the same as that of the generator, and the waves are of equal length. The current waves from an alternator may approximate a sine wave very closely if the electro-motive force is harmonic, and, in fact, if there is no leakage on the line it will be truly harmonic; or under some circumstances it may still be harmonic, provided there is a correct relation between the leakage, resistance, inductance and capacity.

The Divining Rod.

M. E. Wadsworth, of the Michigan College of Mines, gives the following theory of the mechanical action of the divining rod, which he says has been repeatedly tested by him in the presence of his classes and shown to be correct. The process is exceedingly simple. Take any forked twig of reasonably tough fiber in the clenched hands with the palms upward. The ends of the limbs forming the twig-fork should enter the closed fist on the exterior side of each fist, *i. e.*, on the two sides of the clenched hands furthest from each other.

When a twig is grasped in this position it will remain stationary if held loosely or with only a moderately firm grasp, but the moment the grasp is tightened the pressure on the branches will force the end of the twig to bend downwards. The harder the grip the more it must curve.

The curvature of the twig is mechanically by the pressure of the hand, forcing the limbs to assume a bent and twisted position; or the force that causes the forked limb to turn downwards is furnished by the muscles of the hands, and not by any other cause.

The whole secret of the divining rod seems to reside in its position in the hands of the operator, and in his voluntarily or involuntarily increasing the closeness of his grasp on the two ends of the branches forming the fork.

If the above conditions are fulfilled, the twig will always bend downwards—water or no water, mineral or no mineral. Any one can be an operator, and any material can be used for an instrument, provided the limbs forming the fork are sufficiently tough and flexible.

It can be easily understood how an ignorant operator may deceive himself and be perfectly honest in supposing that some occult force, and not his hands, causes the fork to curve downwards.

Californian Pine Products.

Mr. W. C. Blasdale recently read a paper before the Science Association of the University of California (Chemical Section), relating to the products obtained by distilling the resins of some Californian pines. Some years ago a liquid was put on the market known as "abietin" or "aurantine," for use in removing grease, etc., and also as an anæsthetic. It was said to be made from the nut-pine. This was examined by Dr. Wenzell of the College of Pharmacy, who published the results of his work. It was afterwards thoroughly investigated by Prof. Thorpe, now head of the British Government laboratories. Prof. Thorpe found the liquid to be nearly pure heptane (C_7H_{16}), which is one of the paraffins, a substance which had only been found in petroleum and fish oil. The occurrence of a paraffin in a vegetable product was so extraordinary that it seemed doubtful whether the material was really obtained from the pine.

Mr. Blasdale therefore collected a quantity of resin from *Pinus Sabiniana* (the well known nut-pine or Digger pine of the foothills) and from several of our native pines, and distilled them in a current of steam. The amounts of material obtained were not large enough to allow of as full investigation as desired, but quite sufficed to show that the true heptane is undoubtedly obtainable from the resin of the nut-pine and also from the black pine (*P. Jeffreyi*) of the timber belt. These two Californian pines differ botanically in many ways from the Old World and Eastern species, which yield the so-called terpenes ($C_{10}H_{16}$) when their resins are distilled. On the other hand, the resin of the Tamarack (*P. Murrayana*) yields a terpene resembling that of the European and Eastern pines. The annexed figures show the average results obtained with the distillates:

	Boiling point Centigrade.	*Specific Gravity.*	*Index of Refraction*
P. Sabiniana (nut pine)	97°	0.6860	1.390
P. Jeffreyi (black pine)	97°	0.6863	1.388
P. Murrayana (Tamarack)	160°	0.864	1.476
Heptane of Professor Thorpe	98.43°	0.6885	1.388
Terpenes (about)	155° to 175°	0.85	1.45 to 1.5

The distillate from the Tamarack resin alone has a considerable effect upon polarized light, confirming its terpene character, while those of the first two (like true heptane) have scarcely any effect.

A number of products of California pines and firs were exhibited, including the balsam of the silver fir, which closely resembles Canada balsam, so largely used in microscopic work, and might be used for the same purpose.

PLUMBAGO as a lubricant for machinery has been tested by Prof. Thurston, at the Stevens Institute of Technology, with the following results: With a pressure of 48 pounds per square inch on the bearing tested, 335 milligrammes of the best sperm oil allowed 7198 revolutions to be made before friction caused squealing. With 120 milligrammes of perfected graphite, mixed with water, 19,635 revolutions were made before squealing began. With a pressure of 60 pounds, 335 milligrammes of best sperm oil allowed 33,360 revolutions; best lubricating grease, to same weight, allowed the same number of revolutions; the same quantity of grease, with 15 per cent graphite added, allowed 194,941 revolutions. The speed in all cases was 2000 revolutions per minute. To get such results, it is to be understood that pure flake graphite is to be employed.

CHEMICALLY pure iron exists only as a curiosity and has no practical application in the arts. It is void of commercial value and cannot be prepared upon a large scale.

Too Truthful to be Pleasant.

California as a gold country was the wonder of the world in the 50s. It ought to be a greater wonder now. But California became bewildered, missed its guiding star, took a different road and let another, with clearer vision, push by her. California lost her head over her oranges and olives, her prunes and her wheat fields. She allowed her farmers to become inflated with a misconception of their relative importance. She ignored the great law of supply and demand and quarreled with and oppressed her only class of laborers whose product is superior to this law. She allowed her millions and tens of millions invested in the mining industry to be confiscated. She branded her miners as criminals and confidence men. Her anti-debris commission sent out its spies to hale the luckless miner to prison. Her bankers meeting him upon the street passed him by on the other side. The subject became almost as a skeleton in the closet—a thing not to be mentioned by the daily press. A stranger passing through San Francisco would perhaps never hear mining mentioned or read of it in the daily papers. Its railroads carefully avoided all reference to it in their literature. Chinatown was something to herald—mining a subject to carefully avoid. Its camps were almost without exception reached by wagon roads only. Its railroad methods and purposes are too generally understood to need extended reference here. The most attractive gold mining territory under God's footstool, reaching from the Siskiyous to the Colorado desert, from the golden sands at the ocean's edge to the bleak plains of Nevada, has yet to do battle against all these odds for the preservation and maintenance of the most profitable industry any State ever had.

We cannot read the future, but we know that California is the Golden State by birthright, and that her possibilities no man can measure.—Oregon Mining Journal.

THE much-sought-for alkahest, or universal solvent of the alchemists, is almost realized in fluorine, which was first prepared by Moissan in 1886. The transparent vessels in which it is contained have to be made of some fluoride, its action on ordinary glass being very vigorous and destructive. The difficulty of handling the gas, even in the laboratory, has hence been very great, the fluoride vessels being brittle and clumsy as well as expensive. Professors Dewar and Moissan, being desirous of more fully investigating the properties of the gas, recently conducted a series of experiments at the Royal Institution, in which by means of liquid oxygen they succeeded in liquefying fluorine, and in this comparatively inert state could more fully and carefully examine its properties. The apparatus used for liquefying the gas consisted of a small cylinder of thin glass, into the upper part of which was fused a platinum tube surrounding a smaller tube of the same material. The fluorine enters through the larger tube, passes around the glass envelope, and escapes through the smaller tube. The glass cylinder being cooled down to the temperature of boiling liquid oxygen (—183°), the current of fluorine gas was passed through the bulb without becoming liquid. At this low temperature, however, the fluorine did not attack the glass. On still further lowering the temperature of the liquid oxygen, by exhaustion, a yellow liquid was seen collecting in the glass envelope, while gas no longer escaped from the apparatus. At this moment the escape tube was closed to prevent the entrance of air, and the glass bulb soon became full of a clear yellow liquid possessed of great mobility. Fuorine thus liquefies at about —185°. The chemical activity of the gas was found greatly reduced when in the liquid state, but even then benzine or oil of turpentine underwent spontaneous decomposition when brought into contact with it. It would thus seem that the powerful affinity of fluorine for hydrogen is the last to disappear. In a subsequent experiment, in which liquid air was used and a temperature approximating —210° obtained, the liquid fluorine showed no signs of solidification. Experiments to determine its density led to the conclusion that it had about the same specific gravity as amber, 1.14. Different samples of the liquid examined with the spectroscope showed no specific absorption bands in the visible spectrum. It was found to be not magnetic.

MUCH has been said of late years, in discussions concerning the "rare earths" and the search in them for new metals, about monazite; and the mineral has obtained considerable commercial importance in consequence of its use in the manufacture of the incandescent metals of the Welsbach light. Monazite is essentially a phosphate of the rare earth metals cerium, lanthanum and didymium. It also usually contains small variable percentages of thoria in the form of thorite or organite—a derivative of another rare metal, thorium. It crystallizes in the monoclinic system, in tubular or short columnar or needle-shaped crystals, usually well developed and free from distortion, varying from microscopic size to 5 inches in length. It is brittle, transparent in the purest crystals, and of shades of yellow or brown in color. It is an accessory constituent of the granite rocks and their derived gneisses, and has been found in apatite, cyanite and veined quartz, but not in sedimentary rocks. The economically valuable deposits are found in the placer sands of streams and rivers, in the irregular sedimentary sand deposits of old stream beds and bottoms, now covered up, and in the beach sand deposits of certain seashores. Workable deposits of monazite have so far been found only in limited geographical areas. The only one in the United States are the placer beds in North and South Carolina, though in recent communications to this paper Waldemar Lindgren of Stanford University cites the existence of monazite deposits in Idaho. The North and South Carolina deposits occur in gravel, from 1 to 2 feet thick, in streams that are seldom more than 12 feet wide. Other deposits are found in Brazil, the United States of Colombia and Russia. The value of monazite depends on its percentage of thoria, the earth sought after by the Welsbach light men. The Carolina beds furnished 1,900,000 pounds of monazite in 1896, at from 6 to 10 cents a pound. The next year the output fell off, both in the amount and price, on account of the competition of the Brazilian field, where the production is easier and cheaper.

AN electrical engineer, expert upon gas engine matters, says: "There is a big future in the foreign trade of gas engines; the innumerable uses to which they are applied are alone a recommendation and bound to create a demand. In a country where fuel is high they are mostly in demand. There are to-day American gas engines being extensively used in Europe. In Paris there are engines of 300 H. P. that were made in this country some time ago. Only a few days since the manufacturers of those engines heard of the great saving they were to the parties using them, and how highly they speak of them. Any town where ordinary gas is manufactured can be made a field for the sale of gas engines. The principal uses to which they are applied are for pumping and for driving dynamos for small plants; but when it is realized that to-day gas engines are made from ½ to 300 H. P., the many uses to which they may be put are extraordinary. The Central and South American countries are beginning to buy these machines, and it is expected that as their many uses are shown to the people the demand will increase."

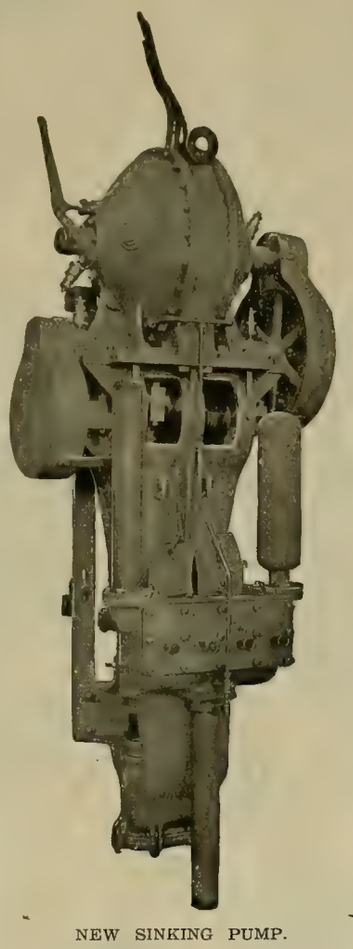
THE value of the instruments and machinery during '97 for scientific purposes exported from the United States was $3,054,453, which was an increase of half a million dollars as compared with the exports in '96.

A Great Event.

In September last the *Miner* published the statement that the MINING AND SCIENTIFIC PRESS of San Francisco had suggested that there be a semi-centennial celebration of the discovery of gold in California by James W. Marshall at Coloma, El Dorado county, on January 19, 1848. At that time the *Miner* commended the suggestion and pointed out the good results that had followed the discovery of that historic nugget. It resulted in the building up of important empires on the Pacific coast on both sides of the international boundary line and gave a stimulus to all sorts of business on this continent, the good effects of which are felt even to this day. The suggestion of the San Francisco paper was warmly endorsed by the *Miner*, and the idea met with many commendations from some of the other papers of the coast. The suggestion was carried out, and never in the history of San Francisco was there a more hearty, widespread and spontaneous accord in the celebration of an important event than there was in this. The Golden City is noted for the fervor with which it observes the anniversaries of importance and is said to have outshone all previous efforts on this occasion. The finding of gold in California was as momentous an event to the people of the Pacific slope and the western part of the continent as was the landing of the Pilgrims on the eastern coast, and was more wide reaching and important in its effects. —Rossland, B. C. Miner.

Another Reminiscence.

TO THE EDITOR:—In your valuable paper of Jan. 29th, '98, page 108, par. 3, Mr. C. P. Stanford wishes to know who was the first inventor of the modern way of hanging up a stem. The invention was first made and put in use at the Reese mill, Sierra Buttes gold mine, by a German at work there in the early fifties. I think some of the early owners of that property would remember the name and date—perhaps Reese Bros. of your city.



GEO. G. MORRISON.

Sierra City, Cal., Feb. 5th, '98.

REGARDING the description of the proposed Kern Co., Cal., electric plant in the issue of the 29th ult., a Mariposa correspondent writes that while the outline is correct, "the details do not fit. The proposal to establish turbines to develop 12,000 H. P. at first does not fit the Kern proposition. Modern practice rarely sets turbines under heads of more than 60 to 75 feet, but the average flow of the Kern in most years would have to be evenly distributed over the whole year and then doubled to give this power under 100 feet head. The company is to store the *winter flood* for the *dry summer season*, thus equalizing the flow and doing away with the present disastrous floods, etc. Yet the Kern hasn't any winter floods, and from November 1st to March 1st carries less than one-sixth the total flow of the year. The storing is to be done in reservoirs of a capacity of 42,000-acre feet, done over into gallons, which makes the figures look big. This will not prevent many floods, for the average June flow of the Kern would fill the reservoir once a week, and in the month of June, '84, would have filled it sixteen times. This reserve supply, according to the article, is to increase the river flow 50% during the dry season. In truth, it will not add 10%, during the dry months, to a flow less than half the claimed capacity of the installation. Just this mistake has been made in the new 5000 H. P. installation near Butte, which is on a stream flowing as low as 60 second feet at times; storage has been provided there, and similar claims are made, and the reserve supply is equal to supplying the deficiency for just thirteen days. The company has bought already two 1000 H. P. engines to set up in the power house, with duplicate steam plants already existing at Butte, where steam coal costs but $3 per ton."

Mine Sinking Pump.

A mine sinking pump, compact in form, of full rated capacity and efficiency, and not easily damaged by moisture or hard usage, has recently been constructed by the General Electric Company. The pump is one of the duplex double-acting type with outside packed plungers. Its cylinders are 5x6 in.; it runs at seventy-five revolutions per minute and has a capacity of 150 gallons against 300-foot head. It is driven by a specially designed 15 H. P. enclosed induction motor, in which the gears and all the mechanism are completely protected by a water-tight steel casing. The shaft and starting lever pass through stuffing boxes. The casing was tested for a leakage with steam

NEW SINKING PUMP.

pressure up to thirty-five pounds per square inch. The wearing parts are all large and of extra heavy design, the crank shafting being one solid forging fitted with brass bearings. The connecting rods are of the Marine end type and are forged. The guides are bored in the intermediate mechanism, so that the cross-head must always be in line with the pump cylinders. By removing one plate on the pump, all the valves may be reached at one time. This sinking pump was designed to withstand without injury all the hard usage to which mining machinery is subjected. As the case is water tight, the pump works as well under water as out. It may be completely "drowned" by a sudden inrush of water in the mine, but its operation is not affected. This pump is now in operation at Pachuca, Mexico.

CONCERNING the useful aspect of earthquake observations in Japan, it is now clearly recognized that ordinary engineering practice as applied to embankments, piers for bridges, tall chimneys, the framing of ordinary dwellings and other structures is to be avoided; and whenever, as, for example, after a disastrous earthquake or a fire, reconstruction is required, new methods are adopted, and the loss of life and property is being steadily reduced. The application of seismometry to measuring the irregular movements of locomotives has resulted in new forms of balancing the engines, with, among other incidents, a marked saving of fuel. By the use of seismographs along the coast of Japan, submerged areas of seismic activity have been mapped through which it would be dangerous to lay a cable. Instruments which record the unfelt movements of the earth's crust sometimes tell us that cable interruption is due to earthquake action so far from land that it cannot be felt by those on shore. These instruments, wherever they are established, give information of great seismic disturbances, even when they take place at the antipodes of the place of observation. Hence they enable us to correct, confirm, and even to disprove telegraphic information.

PROF. BURTON has published an interesting collection of statistics which prove the influence that magnetism is exerting in proving phenomena, which otherwise would be inexplicable. Among other things, he shows that in making a railroad running east and west, as many as thirteen steel rails will become crystallized and break, before one rail on a north and south track is similarly affected. This is due to the generation of magnetism by friction, and to the fact that in the former instance the polarity of magnetic current is resisted in the rush of the train; whereas in the latter case it is undisturbed.

A TRUE FLOATING DOCK may be described as a structure which utilizes its displacement for lifting a ship so much above its normal draught line as to bring the keel above the level of the water's surface. In the case of a graving dock the water is taken away from the ship, and in the case of a floating dock the ship is taken away from the water.

Coast Industrial Notes.

—D. Ward of Detroit, Mich., has bought 8000 acres timber land in Humboldt and Del Norte counties, Cal., for $80,000.

—The California State Board of Trade has adopted rules under which California will make an exhibit at the Omaha exposition. The two essential conditions imposed are that 10,000 feet of floor space in the exposition building, at Omaha, be donated free of cost, and that by April 1st $15,000 be in the hands of the Board of Trade, which undertakes to collect the exhibits.

—H. J. Crocker of San Francisco has bought almost the whole bond issue of the Sierra Railway Company of California. Of the total issue of $634,000 he takes $515,000. The road, which runs from Oakdale, Cal., to Jamestown, forty-three miles, was completed and commenced operating November 10th, '97. The bonds are 6 per cent forty-year gold bonds, secured by a first mortgage on the road and its equipment, and a sinking fund of 5 per cent of the annual net earnings is provided for.

The Secretary of the Treasury has made a ruling that bullion produced in bond from imported ores and transported from a bonded smelter for refining need not be weighed or assayed on entry for rewarehousing, since the quantity to be charged with duty on such entry must be equal in every case to the quantity so charged on the transportation entry, so that the warehousing bond cannot be canceled otherwise than on the exportation of or payment of duty on 90 per cent of such quantity.

—At Salinas, Cal., the new beet sugar factory and refinery will be of unusual dimensions. Main building—582 feet long, 102 feet wide, 5 stories high; contains 3500 tons of steel, 4,000,000 bricks and 800 squares of slate. Boiler house—559 feet long, 68 feet wide, 22 feet high; contains nearly 1,000,000 bricks, 12 boilers, 4 economizers, 2 steel smokestacks 216 feet high, 13 feet in diameter; each stack with base weighs 1000 tons. Machine shop and carpenter shop—559 feet long, 40 feet wide, 22 feet high; contains about 600,000 bricks. Water required to keep mill running, 18,000,000 gallons per day. Will consume about 1200 barrels of oil per day of twenty-four hours, or its equivalent in wood or coal; will cut 3000 tons of beets per day of twenty-four hours. Sugar—Will produce about 450 tons of sugar daily.

—Los Angeles, Cal., reports that the price of oil remains at $1 a barrel, with increasing demand. The Oil Producers' Trustees report having concluded contracts last week for the delivery to six oil-consuming firms of Los Angeles of 150,000 barrels of oil. In no single case of the six contracts does the period of delivery for the quantity of oil contracted for extend beyond one year, and in one case the quantity called for in the contract is to be delivered within three months. They also report having made an agreement with firms in San Francisco for the delivery of 60,000 barrels of oil within one year from February 1. The contracts with these San Francisco firms give the latter the privilege of contracting for an additional 60,000 barrels for delivery within the same period, and it is believed that contracts for that additional quantity will be signed during the present week. These deliveries in San Francisco will be in addition to contracts already in force, and which call for an average of 10,000 barrels a month.

Personal.

I. L. MOORE is Supt. Lucky Marion at Greenwood, Cal.

THOS. FERGUSON is Supt. Crystal mine, Marysvale, Utah.

J. K. WOLKOTTE is Mgr. Gladstone mine, French Gulch, Cal.

R. K. HOWK is managing owner of the Mt. Shasta mine, Shasta, Cal.

F. W. WILMANS, Pres. Rose Bud M. Co., has returned to Sonora, Cal.

JOHN SHANKS is Mgr. of the Rich Hill M. & M. Co., Cœur d'Alene, Idaho.

H. ZADIG announces his intention to leave next month for the Klondike.

W. P. BLAKE of Tucson has been appointed territorial geologist of Arizona.

C. E. UREN, Supt. Allison Ranch mine, Grass Valley, Cal., is in San Francisco.

WM. MADDEN of the Brunswick mine, Grass Valley, Cal., is in San Francisco.

H. L. SWAIN, Supt. Ibarra mines, Calmalli, Mexico, has gone to Santo Domingo.

J. E. SENTON, Supt. Grover Cleveland mine, Placerville, Cal., is in San Francisco.

J. M. BUFFINGTON, Supt. La Suerte mine, Nevada City, Cal., is in San Francisco.

J. C. DIAMOND, Mgr. Limpensel mine, Placerville, Cal., was in San Francisco.

L. R. POUNDSTONE, Supt. Oro Fino mine, Shingle Springs, Cal., is in San Francisco.

F. T. FREELAND is succeeded by G. B. Kilborn as Mgr. Isabella mine at Cripple Creek, Colo.

H. APPEL, Mgr. and part owner of the Mariposa mine at Alleghany, Cal., is in San Francisco.

M. W. MATHER, Supt. Plumbago mine, Alleghany City, Cal., has returned from New York.

CAPT. MCCLINTOCK, Supt. Rhode Island and Philadelphia mines, Sonora, Cal., is in San Francisco.

GEO. SCHMITT, Mgr. National mine, Redding, Cal., has returned to the mine from San Francisco.

DANA HARMON, Supt. Gaston Ridge mine, Graniteville, Cal., has returned to the mine from San Francisco.

FRANK PANTER, owner of the Evening Star mine, Whitehouse, Cal., has returned home from San Francisco.

COL. COLES, Mgr. Montauk mine in El Dorado Co., took charge this week. His headquarters are at Auburn, Cal.

F. BOECKMAN, Pres. Providence M. Co., Nevada City, Cal., has returned to San Francisco from a visit to the mine.

J. C. WRIGHT of Indianapolis, Ind., principal owner of the Grand Victory mine at Placerville, Cal., is in San Francisco.

J. H. NEALE, owner of the Sugarman mine, at Sonora, Cal., has charge of the Tuolumne county exhibit at the Golden Jubilee Fair.

DR. A. SCHIEDEL, the Australian representative of the New Zealand Mines Trust, is visiting the upper and lower Thames fields.

Recent California Mining Incorporations.

North Alaska D. & T. Co., San Francisco; capital stock $100,000, subscribed $70; J. L. Du Frane, J. G. North, J. Leale, W. G. Leale, A. W. Wehe, A. A. Anderson, M. Marcus.

Free American M. Co., San Francisco; capital stock $250,000; subscribed $5; O. E. Moore, W. Dennis, W. C. Alberger, C. H. Street.

North British M. Co., San Francisco; capital stock $100,000; subscribed $1000; T. H. Douglas, G. Williams, A. Lome, C. Chapin.

Monte Cristo M. Co., San Francico; capital stock $250,000, subscribed $50; G. M. Ward, P. Harvey, E. E. Harlow, F. H. Gould.

Tricolor Con. M. Co., Tuolumne county; capital stock, $5,000,000; C. S. Long, C. C. Hamilton, W. G. Long, C. W. Everett.

Recently Declared Mining Dividends.

Portland G. M. Co., Colorado, 1 cent per share, $30,000; payable Feb. 15; total to date, $1,327,080.

Anchoria-Leland, Colorado, 1 cent per share, $6000; payable Feb. 15; total to date, $114,000.

Sacramento, Utah, $5000; payable Feb. 28.

Silver King, Utah, $37,500; Feb. 7; total to date, $1,425,000.

Champion M. Co., California, forty-sixth dividend of 25 cents, $8500; payable Feb. 15.

Atlantic Copper M. Co., Michigan, $1 per share, $40,000; Feb. 5.

Boston & Montana M. Co., $3 per share, $450,000; payable Feb. 19.

Quincy Copper M. Co., Michigan, $3 per share, $300,000; payable Feb. 15.

Obituary.

HUGH MATHESON, president of the Rio Tinto M. Co., died in London last Tuesday.

H. B. HAVENS, president of the Gould & Curry and Utah mining companies and of the Kincaid Mill Co., died at his residence in San Francisco last Thursday, aged forty-five years.

Books Received.

"*The Planning and Construction of High Office Buildings*," by William H. Birkmire, 346 pages, 4to., unusually well printed, with handsome illustrations, half-tones, shop drawings, etc.; of value to all, but of special interest to architects and builders; supplementary to the author's former work, "Skeleton Construction in Buildings." The contents of this book are the practical experience of a practical man and are of value. The subject is one that is of immediate concern to all city residents; the high office building is here to stay. The latest and in many respects the best illustration of its value is afforded by the recent construction of the Claus Spreckels Building in this city. Every detail of the building of a twenty-story building from the first step in the construction of the pneumatic caisson to the copper flashing on the roof is herein set out in detail by a man who has made such construction his life work. Published by John Wiley & Sons, New York City. Price $3.50.

"*A Manual of Mining*," 548 pages, by M. C. Ihlseng, third edition, being a condensation of a course of lectures upon mining delivered at the School of Mines in the State of Colorado, designed as an elementary treatise for the use of those desiring a reference book; the subject being brought to the close of the year 1897. The author has drawn from the best sources and made a valuable compilation on methods of mining, with intelligent comment. Considerable space is devoted to ventilation and hygienic requirements; and the chapter on timbering—which, like the rest of the book, is elaborately illustrated—is of considerable practical interest. The book is more for the non-metalliferous than for the metalliferous miner, but contains considerable of practical value to all underground workers. Published by John Wiley & Sons, New York City. Price $4.

"*A Description of Minerals of Commercial Value*," D. M. Barringer, oblong, morocco binding, 168 pages; an admirably arranged and valuable reference book for practical use, giving the maximum of information with the minimum of words. Published by John Wiley & Sons, New York City. Price $2.50.

Commercial Paragraphs.

THE E. P. Allis Co. has received an iron medal from Trieste, Austria, made from the first piece of pig iron ever manufactured in Europe with Milwaukee machinery. About six months ago the Allis Co. made two blowing engines for an Austrian firm, each costing $30,000.

THE Westinghouse Electric and Manufacturing Co. have shipped a trainload of electrical apparatus to the Dyea Klondike Transportation Co., which will be used for the operation of an electric rope tramway across the Chilkoot pass. This is the first consignment of electrical machinery to go to that region.

DR. NELSON of Milford, Utah, placed an order with the Colorado Iron Works Co. for a 10-stamp gold amalgamating mill, to be erected at that place. The power for this plant will be sufficient to run twenty stamps. The Colorado Iron Works Co. are Western agents for the Erie City Iron Works engines and boilers, and will furnish the engine and boiler of their make for this plant.

MR. A. MIDDLEBROOK, the Denver Mgr. of the Jeanesville Iron Works Co., reports building two large compound condensing mine pumps for Japan, three electric-driven mine pumps for South Africa, one large compound condensing pump for the coal mine at Cumberland, Md., one for the D. L. & W. Railway Co., one for the Canudy Coal & Railway Co., Nova Scotia, two for the Ibex mines, Leadville, Colo., and a good many smaller sizes.

THE Best Manufacturing Co. of San Leandro has just sold one of its largest traction engines, with complete outfit of wagons, to the DeLamar Mining Co. of Utah. It will be used for hauling ore a distance of seventeen miles, and it is calculated to save 50 per cent as compared with the present system of transportation by mule power. A single engine will haul a load of fifty tons at the rate of three miles per hour on ordinary country roads.

THE exhibit of silver-plated copper amalgamating plates, for saving gold in quartz and placer mining, made by the Denniston San Francisco Plating Works, 653-655 Mission St., E. G. Denniston, proprietor, at the Golden Jubilee Fair, is a fine one. For thirty-five years this establishment has manufactured these plates and their reputation is world-wide. Awards made for silver-plated amalgamating plates have been given to the Denniston San Francisco Plating Works. Every description of metal goods is plated with gold, silver, nickel, copper, brass, bronze, etc. A visit to these works will repay those who are desirous of seeing the process of depositing metals by electricity.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BICYCLE GEAR CHANGING MECHANISM.—Willard B. Featherstone, San Francisco, Cal.; assignor to the Lo-Hi Sprocket Co. No. 598,336. Dated February 1, 1898. This invention relates to a device which is especially adapted for changing the gears upon bicycles, tricycles, or any vehicle to which the device can be applied, so that the speed of the driving mechanism can be changed from a higher to a lower, and vice versa. It consists essentially of a crank shaft having a pinion fixed thereto, a disk exterior thereto having two different diameters, one of which forms a clutch to engage the pinion when both have a common center of rotation, and larger internal gearing at one side of the clutch flange; a disk eccentrically pivoted to the frame concentric with and forming a bearing about which an exterior sprocket wheel is turnable, lugs by which the sprocket wheel is connected with the internally toothed disk and a mechanism by which the disk is moved endwise upon its shaft so as to first disengage the smaller circle of teeth upon the pinion, and, secondly, to turn the eccentric disk about its fulcrum point to engage the larger internal teeth of the disk with the pinion and produce a slower movement.

BRUSH-HANDLE SCRAPER ATTACHMENT.—Anthony W. Permento, San Francisco, Cal. No. 598,349. Dated February 1, 1898. This invention relates to an improved scraping attachment for brushes and similar articles, the object of which is to enable the user to scrape and clean paint or to clean mud from shoes before blacking, and other similar purposes. It consists essentially of a handle with a slot or channel made in the end, a blade slidable in the channel and conforming substantially in outline to the shape of a handle, cam-shaped slots in the blade and pins in the handle engaging the slots so that the blade may be moved longitudinally and also transversely to project its end beyond the end of the handle, and its edge beyond the side.

SAN FRANCISCO ARTIFICIAL LIMB CO.,
MENZO SPRING, Proprietor,
Manufacturer of the BEST
✦ Improved Artificial Limbs, ✦
Office and Address, 9 Geary Street, San Francisco, Cal. (Junction Kearny and Market.)
Send for Measure Blanks for Self-Measurements; free to any address on application. Commissioned by U. S. to furnish Limbs on Government Orders. Artificial Limbs Repaired with Skill and Dispatch.

A. L. FISH, Agent for
Buckeye Engines,
American Steam Fire Engines.
HAS FOR SALE CHEAP
A First-Class Air Compressor (Steam Driven) and Drill (New), also Three-Ton Capacity Pulverizer.
59-61 FIRST STREET,.....SAN FRANCISCO.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

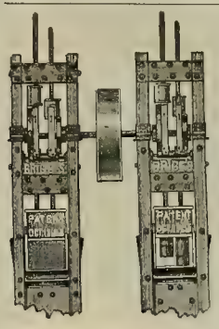
NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

TEN WEEKS FOR TEN CENTS!
Strange as it may seem, that big family paper, the *Illustrated Weekly Sentinel*, of Denver, Colorado, (founded 1890) will be sent ten weeks on trial for 10c.; clubs of six, 50c.; 12 for $1. Special offer solely to introduce the paper. Gold rings set with Rocky mountain gems are given free as premiums. Latest mining news and illustrations of grand scenery each week, also true stories of love and adventure. Address as above and mention PRESS. Write today: postage stamps taken.

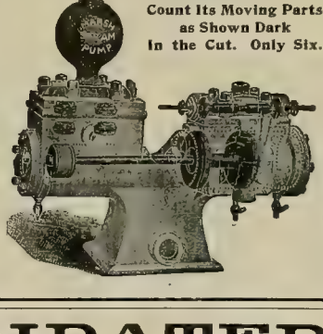
WANTED.—Position to take charge of a quartz mine. Am a practical miner, and have had charge of a number of properties in different States for the last 20 years. Can furnish the best of reference. Address J. D., Mining and Scientific Press.



MINING ENGINEER
Of experience desires engagement as superintendent, or to open mines, or to exploit mining properties. Address "ROBERTS," Mining and Scientific Press, San Francisco.

WANTED.
Position by a reliable and thoroughly experienced mine bookkeeper, time and stockkeeper, general merchandise clerk, typewriter and stenographer. Age 25. Can furnish own typewriter Location no object. References. Address J., Mining and Scientific Press.

Position as Manager or Superintendent of Mines and Mill.—A mining engineer of 20 years' practical experience in mining, milling and placer mining, understands construction and operation of stamps, Huntington's and roller mills, amalgamation and concentration to any degree of fineness with jigs, buddles, vanners, bumpers, and Wilfley tables; makes surveys, maps and plans of mines and mills, and does practical assaying; experienced in handling free gold, and sulphurets of iron, copper, lead, zinc and quicksilver; can examine and report on mines; will be open for engagement about March 1, 1898. Box 30, Mining and Scientific Press.



TO MINE SUPERINTENDENTS.
AN EXPERIENCED SURGEON, Graduate of Regular School,
Offers his services to one or more mines employing a sufficient number of men, or if the number be not sufficient to compensate him, he would undertake to do the ordinary ore assaying for the mine to a limited amount. Address MEDICUS, care of Mining and Scientific Press.

WANTED.
WILFLEY CONCENTRATOR.
Must be Guaranteed in Perfect Condition, of the Latest Design and Cheap for Cash.
Address WILFLEY, care of Mining and Scientific Press, San Francisco, Cal.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

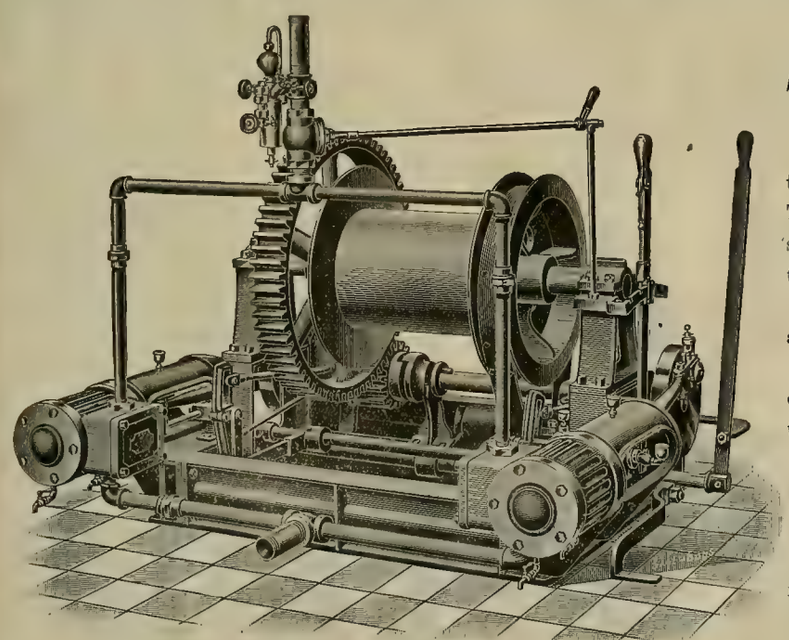
THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.



Can be taken apart and transported to any locality.

BAKER & HAMILTON,

HIGH GRADE

Engines, Boilers,

ICE MACHINES, MINING TOOLS, Etc., Etc.

THIS CUT represents one of our improved **DOUBLE CYLINDER STEAM HOISTING ENGINES.** We have them in sizes from 12 H. P. up (with or without boilers). They are constructed with the greatest care by engineers familiar with the best previous practice. They come with sectional iron frames, reversible link motions, etc., consequently can be shipped knocked down, in pieces suitable for transportation over difficult roads and trails.

We also have them with the Single Engines from 6 H. P. up; Boiler and Engine contained on same frame.

These outfits are built in the most substantial manner possible, and on the most approved principles. We recommend them in every particular.

WRITE FOR PRICES; THEY WILL INTEREST YOU.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.**

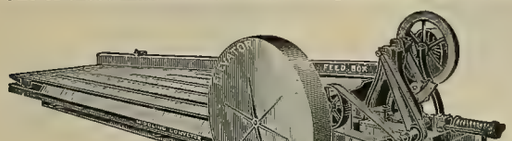
It infringes no patents, any statements to the contrary are false and made to mislead intending purchasers.

WHITE, ROGERS & CO.,

Constructing Engineers and Millwrights,



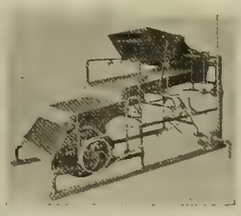
Offices: 306 PINE STREET, SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR. PRICE $450 F. O. B. San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

SEND FOR CIRCULARS.



WILFLEY CONCENTRATOR.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

Pacific Placer Machine.

Patented APRIL 20, 1897.

KLONDIKE MACHINE.—If you are going to placer mining in Klondike or any other country, you cannot afford to be without one of these Machines. It will work any class of placer ground, river or sea sands, and save the fine float gold as well as the coarse. The material is graded in four different grades in passing through the Machine. The coarse gold is caught in the riffles above the plates; a double screen is arranged above the plate and amalgamating cylinder, allowing nothing but the water and fine material to pass onto the amalgamating plate and cylinder. This is the Machine for dry countries, as it requires but a small amount of water. By attaching one of our small pumps the Machine will supply its own water from streams or well and raise water 20 feet. One miners' inch of water will supply our large Machine by using the water over. Will work 40 to 50 tons per day. Can be run by hand or power. Built in three sizes. Price $150, $300, $450, f. o. b. S. F. Capacity 10, 25, 40 tons per day. Weight 175 lb, 400 lb, 550 lb. Manufactured for both quartz and placer. Send for Catalog. PACIFIC MINING MACHINERY CO., 127 First St. S. F., Cal.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

PLACER MINING

WITH THE Improved Electrical Shovel or Dredge and Amalgamator,

—MANUFACTURED BY—

THE BENNETT Amalgamator Manufacturing Co.,

DENVER, COLO., U. S. A.

—WORKS:—

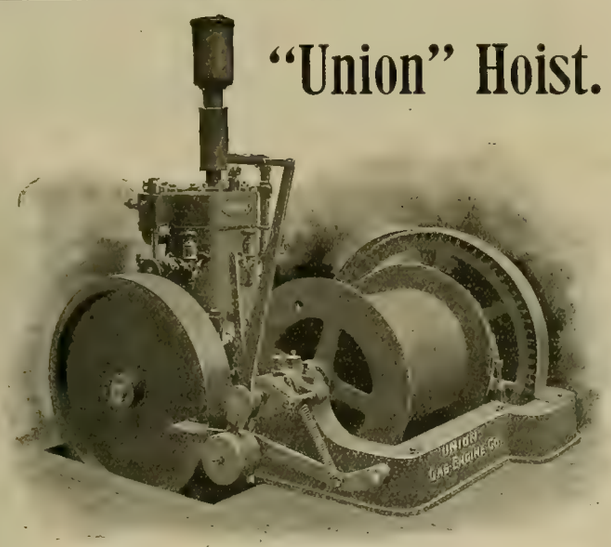
Cor. 36th and Wazee Streets, DENVER, COLO.

Eastern and Foreign Office, Johnstone Building, No. 30 Broad Street, New York, N. Y.
SAMUEL DEXTER HAYWARD, Manager.
Cable Address, "Bennetts." Denver or New York.
Sole Manufacturers (except for the State of Colorado) under all the Patents Covering the "Bennett Amalgamator" Plants.

These plants, being the outcome of many years of evolutionary experiment in the field of their actual operation, are constructed in the most thoroughly substantial and workmanlike manner, of the best material the market affords, with a view to their maximum efficiency, strength and durability; the operating portions almost exclusively of steel, to gauge, and therefore interchangeable, and having been thoroughly tested as to all points, under widely varying conditions, are fully warranted to perform as indicated in the following table:

FOR "GULCH," "BAR" AND "HILL" DIGGINGS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
1 ..	2500	2 to 4	25 to 150	150 tons	Single operating plant
2.	5000	2 to 3	50 to 300	200 tons	Duplex operating plant
3 .	7500	2 to 2¼	75 to 450	300 tons	Triplex operating plant



SWAMP AND RIVER-BED PLANTS.

Number.	Capacity in cubic yards of gravel per 24-hour day.	Total operating cost in cents per cubic yard of gravel.	Miners' inches water required where water is scarce or abundant.	Approximate total weight inclusive of power plants.	
4...	2500	2 to 4	Barge	250 tons	Single amalgamator
5...	5000	2 to 3	Barge	325 tons	Duplex amalgamator

In general terms it may be said these plants consist of the electrically operated dredge and amalgamator, mounted either on steel barges for swamp or river-bed mining, or steel-bodied cars for "gulch," "bar" and "hill diggings," together with the necessary power plants for their operation. Several operating plants, either in close proximity or scattered over a large district, may be operated from a single power station, which may be situated at any convenient point within a radius of a few miles, at railroad depot or where water power can be utilized. The river plants, complete in themselves (each barge containing its own power), are made single or duplex: any suitable number of either can be operated on a river, each independently working its allotted section from surface to bedrock, and rim-rock to rim-rock. All these plants are built with a view to easy transportation, in "knock-down" shape over ordinary mountain roads, and, on special order, the size and weight of separate parts may be still further reduced. In the foregoing table the figure representing the smaller quantity of water required applies to cases where, for any reason, it is desirable or necessary to use the water over and over. The water required may be taken from below the placer, thus obviating the necessity of long ditches, etc. Since these plants neatly pile their debris on the cleaned-up bedrock of the ground worked, they may be said to create their own dump, and hence are enabled to successfully operate on flat ground, or where ordinary dumping facilities are lacking. This peculiarity also renders them independent of "debris laws." The wonderful perfection with which these plants extract the finest, microscopic particles, such as are held in suspension in water, or, when dry, ascend in a gentle current of air, constituting in bulk a perfectly impalpable powder (send for samples), renders them particularly valuable and indispensable in cases where, owing to the fineness of the golden particles, very rich mines are unavailable for profitable working by the hydraulic or sluice processes.

All plants are furnished with duplicate parts and wearing pieces to cover at least two years' constant use, while the life of the plant is conservatively placed at twenty-five years' active service. For further information address as above.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.
